| Mask MSR                | CAT-only Operation | CDP Operation |
|-------------------------|--------------------|---------------|
| IA32_L3_QOS_Mask_0      | COS0               | COS0.Data     |
| IA32_L3_QOS_Mask_1      | COS1               | COS0.Code     |
| IA32_L3_QOS_Mask_2      | COS2               | COS1.Data     |
| IA32_L3_QOS_Mask_3      | COS3               | COS1.Code     |
| IA32_L3_QOS_Mask_4      | COS4               | COS2.Data     |
| IA32_L3_QOS_Mask_5      | COS5               | COS2.Code     |
| ....                    | ....               | ....          |
| IA32_L3_QOS_Mask_‘2n’   | COS‘2n’            | COS‘n’.Data   |
| IA32_L3_QOS_Mask_‘2n+1’ | COS‘2n+1’          | COS‘n’.Code   |

One can derive the MSR address for the data mask or code mask for a given COS number ‘n’ by:

- $\text{data\_mask\_address}(n) = \text{base} + (n \ll 1)$ , where base is the address of IA32\_L3\_QOS\_MASK\_0.
- $\text{code\_mask\_address}(n) = \text{base} + (n \ll 1) + 1$ .

When CDP is enabled, each COS is mapped 1:2 with mask MSRs, with one mask enabling programmatic control over data fill location and one mask enabling control over code placement. A variety of overlapped and isolated mask configurations are possible (see the example in Figure 17-29).

Mask MSR field definitions remain the same. Capacity masks must be formed of contiguous set bits, with a length of 1 bit or longer and should not exceed the maximum mask length specified in CPUID. As examples, valid masks on a cache with max bitmask length of 16b (from CPUID) include 0xFFFF, 0xFF00, 0x00FF, 0x00F0, 0x0001, 0x0003 and so on. Maximum valid mask lengths are unchanged whether CDP is enabled or disabled, and writes of invalid mask values may lead to undefined behavior. Writes to reserved bits will generate #GP(0).

### 17.19.6 Code and Data Prioritization (CDP): Enumerating and Enabling L2 CDP Technology

L2 CDP is an extension of the L2 CAT feature. The presence of the L2 CDP feature is enumerated via CPUID.(EAX=10H, ECX=2):ECX.CDP[bit 2] (see Figure 17-33). Most of the CPUID.(EAX=10H, ECX=2) sub-leaf data that applies to CAT also apply to CDP. However, CPUID.(EAX=10H, ECX=2):EDX.COS\_MAX\_CAT specifies the maximum COS applicable to CAT-only operation. For CDP operations, COS\_MAX\_CDP is equal to  $\text{CPUID}(\text{EAX}=10\text{H}, \text{ECX}=2):\text{EDX}.\text{COS\_MAX\_CAT} > 1$ .

If CPUID.(EAX=10H, ECX=2):ECX.CDP[bit 2] = 1, the processor supports L2 CDP and provides a new MSR IA32\_L2\_QOS\_CFG at address 0C82H. The layout of IA32\_L2\_QOS\_CFG is shown in Figure 17-37. The bit field definition of IA32\_L2\_QOS\_CFG are:

- Bit 0: L2 CDP Enable. If set, enables CDP, maps CAT mask MSRs into pairs of Data Mask and Code Mask MSRs. The maximum allowed value to write into IA32\_PQR\_ASSOC.COS is COS\_MAX\_CDP.
- Bits 63:1: Reserved. Attempts to write to reserved bits result in a #GP(0).

**Figure 17-37. Layout of IA32\_L2\_QOS\_CFG**

IA32\_L2\_QOS\_CFG default values are all 0s at RESET, and the mask MSRs are all 1s. Hence all logical processors are initialized in COS0 allocated with the entire L2 available and with CDP disabled, until software programs CAT and CDP. The IA32\_L2\_QOS\_CFG MSR is defined at the same scope as the L2 cache, typically at the module level for Intel Atom processors for instance. In processors with multiple modules present it is recommended to program the IA32\_L2\_QOS\_CFG MSR consistently across all modules for simplicity.

### 17.19.6.1 Mapping Between L2 CDP Masks and L2 CAT Masks

When CDP is enabled, the existing CAT mask MSR space is re-mapped to provide a code mask and a data mask per COS. This remapping is the same as the remapping shown in Table 17-19 for L3 CDP, but for the L2 MSR block (IA32\_L2\_QOS\_MASK\_n) instead of the L3 MSR block (IA32\_L3\_QOS\_MASK\_n). The same code / data mask mapping algorithm applies to remapping the MSR block between code and data masks.

As with L3 CDP, when L2 CDP is enabled, each COS is mapped 1:2 with mask MSRs, with one mask enabling programmatic control over data fill location and one mask enabling control over code placement. A variety of overlapped and isolated mask configurations are possible (see the example in Figure 17-29).

Mask MSR field definitions for L2 CDP remain the same as for L2 CAT. Capacity masks must be formed of contiguous set bits, with a length of 1 bit or longer and should not exceed the maximum mask length specified in CPUID. As examples, valid masks on a cache with max bitmask length of 16b (from CPUID) include 0xFFFF, 0xFF00, 0x00FF, 0x00F0, 0x0001, 0x0003 and so on. Maximum valid mask lengths are unchanged whether CDP is enabled or disabled, and writes of invalid mask values may lead to undefined behavior. Writes to reserved bits will generate #GP(0).

### 17.19.6.2 Common L2 and L3 CDP Programming Considerations

Before enabling or disabling L2 or L3 CDP, software should write all 1's to all of the corresponding CAT/CDP masks to ensure proper behavior (e.g., the IA32\_L3\_QOS\_Mask\_n set of MSRs for the L3 CAT feature). When enabling CDP, software should also ensure that only COS number which are valid in CDP operation is used, otherwise undefined behavior may result. For instance in a case with 16 CAT COS, since COS are reduced by half when CDP is enabled, software should ensure that only COS 0-7 are in use before enabling CDP (along with writing 1's to all mask bits before enabling or disabling CDP).

Software should also account for the fact that mask interpretations change when CDP is enabled or disabled, meaning for instance that a CAT mask for a given COS may become a code mask for a different Class of Service when CDP is enabled. In order to simplify this behavior and prevent unintended remapping software should consider resetting all threads to COS[0] before enabling or disabling CDP.

### 17.19.6.3 Cache Allocation Technology Dynamic Configuration

All Resource Director Technology (RDT) interfaces including the IA32\_PQR\_ASSOC MSR, CAT/CDP masks, MBA delay values and CQM/MBM registers are accessible and modifiable at any time during execution using RDMSR/WRMSR unless otherwise noted. When writing to these MSRs a #GP(0) will be generated if any of the following conditions occur:

- A reserved bit is modified,
- Accessing a QOS mask register outside the supported COS (the max COS number is specified in CPUID.(EAX=10H, ECX=ResID):EDX[15:0]), or
- Writing a COS greater than the supported maximum (specified as the maximum value of CPUID.(EAX=10H, ECX=ResID):EDX[15:0] for all valid ResID values) is written to the IA32\_PQR\_ASSOC.CLOS field.

When CDP is enabled, specifying a COS value in IA32\_PQR\_ASSOC.COS outside of the lower half of the COS space will cause undefined performance impact to code and data fetches due to MSR space re-indexing into code/data masks when CDP is enabled.

When reading the IA32\_PQR\_ASSOC register the currently programmed COS on the core will be returned.

When reading an IA32\_resourceType\_MASK\_n register the current capacity bit mask for COS 'n' will be returned.

As noted previously, software should minimize migrations of COS across logical processors (across threads or cores), as a reduction in the accuracy of the Cache Allocation feature may result if COS are migrated frequently.

This is aligned with the industry standard practice of minimizing unnecessary thread migrations across processor cores in order to avoid excessive time spent warming up processor caches after a migration. In general, for best performance, minimize thread migration and COS migration across processor logical threads and processor cores.

#### 17.19.6.4 Cache Allocation Technology Operation With Power Saving Features

Note that the Cache Allocation Technology feature cannot be used to enforce cache coherency, and that some advanced power management features such as C-states which may shrink or power off various caches within the system may interfere with CAT hints - in such cases the CAT bitmasks are ignored and the other features take precedence. If the highest possible level of CAT differentiation or determinism is required, disable any power-saving features which shrink the caches or power off caches. The details of the power management interfaces are typically implementation-specific, but can be found at *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C*.

If software requires differentiation between threads but not absolute determinism then in many cases it is possible to leave power-saving cache shrink features enabled, which can provide substantial power savings and increase battery life in mobile platforms. In such cases when the caches are powered off (e.g., package C-states) the entire cache of a portion thereof may be powered off. Upon resuming an active state any new incoming data to the cache will be filled subject to the cache capacity bitmasks. Any data in the cache prior to the cache shrink or power off may have been flushed to memory during the process of entering the idle state, however, and is not guaranteed to remain in the cache. If differentiation between threads is the goal of system software then this model allows substantial power savings while continuing to deliver performance differentiation. If system software needs optimal determinism then power saving modes which flush portions of the caches and power them off should be disabled.

#### NOTE

IA32\_PQR\_ASSOC is saved and restored across C6 entry/exit. Similarly, the mask register contents are saved across package C-state entry/exit and are not lost.

#### 17.19.6.5 Cache Allocation Technology Operation with Other Operating Modes

The states in IA32\_PQR\_ASSOC and mask registers are unmodified across an SMI delivery. Thus, the execution of SMM handler code can interact with the Cache Allocation Technology resource and manifest some degree of non-determinism to the non-SMM software stack. An SMM handler may also perform certain system-level or power management practices that affect CAT operation.

It is possible for an SMM handler to minimize the impact on data determinism in the cache by reserving a COS with a dedicated partition in the cache. Such an SMM handler can switch to the dedicated COS immediately upon entering SMM, and switching back to the previously running COS upon exit.

#### 17.19.6.6 Associating Threads with CAT/CDP Classes of Service

Threads are associated with Classes of Service (CLOS) via the per-logical-processor IA32\_PQR\_ASSOC MSR. The same COS concept applies to both CAT and CDP (for instance, COS[5] means the same thing whether CAT or CDP is in use, and the COS has associated resource usage constraint attributes including cache capacity masks). The mapping of COS to mask MSRs does change when CDP is enabled, according to the following guidelines:

- In CAT-only Mode - one set of bitmasks in one mask MSR control both code and data.
  - Each COS number map 1:1 with a capacity mask on the applicable resource (e.g., L3 cache).
- When CDP is enabled,
  - Two mask sets exist for each COS number, one for code, one for data.
  - Masks for code/data are interleaved in the MSR address space (see Table 17-19).

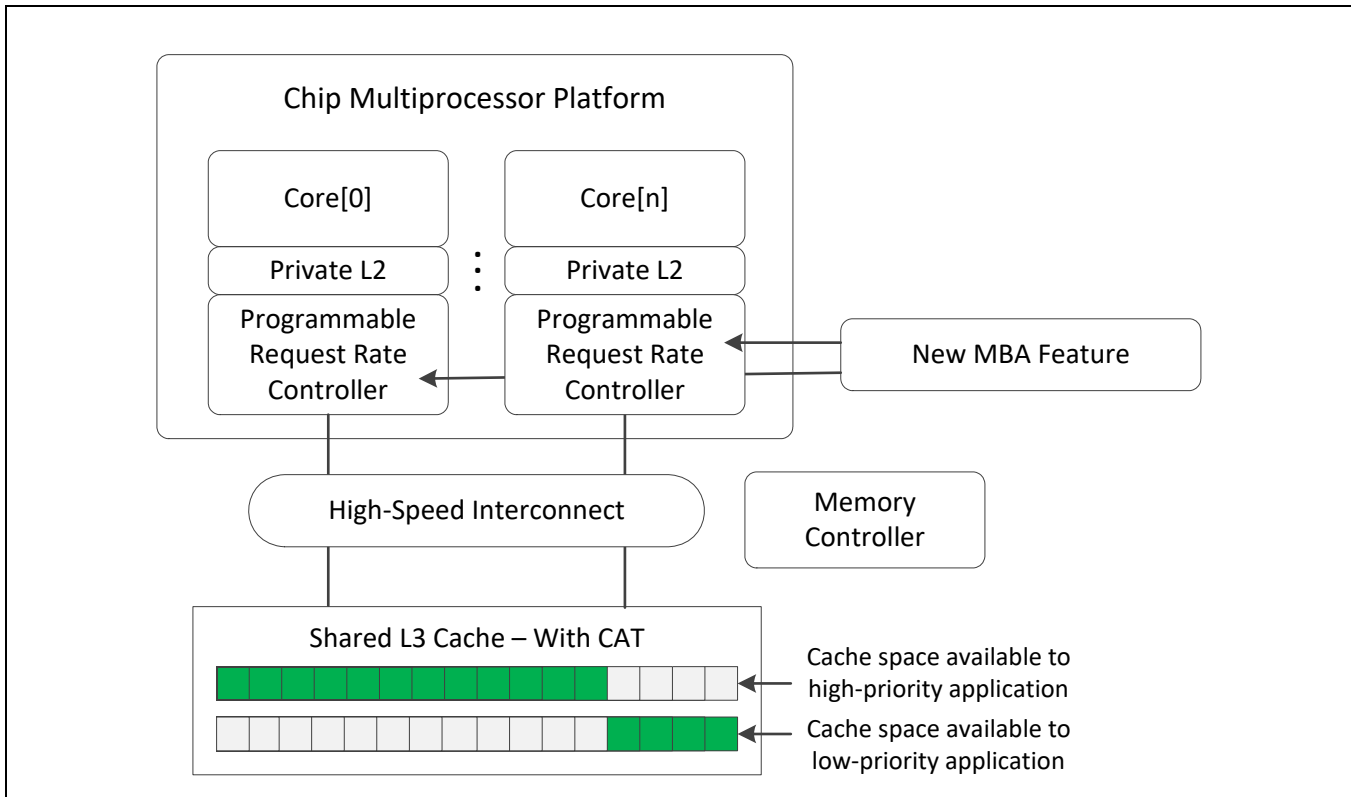

### 17.19.7 Introduction to Memory Bandwidth Allocation

The Memory Bandwidth Allocation (MBA) feature provides indirect and approximate control over memory bandwidth available per-core, and was introduced on the Intel Xeon Processor Scalable Family. This feature provides a method to control applications which may be over-utilizing bandwidth relative to their priority in environments such as the data-center.

The MBA feature uses existing constructs from the Resource Director Technology (RDT) feature set including Classes of Service (CLOS). A given CLOS used for L3 CAT for instance means the same thing as a CLOS used for MBA. Infrastructure such as the MSR used to associate a thread with a CLOS (the IA32\_PQR\_ASSOC\_MSR) and some elements of the CPUID enumeration (such as CPUID leaf 10H) are shared.

- The high-level implementation of Memory Bandwidth Allocation is shown in Figure 17-38.

**Figure 17-38. A High-Level Overview of the MBA Feature**

As shown in Figure 17-38 the MBA feature introduces a programmable request rate controller between the cores and the high-speed interconnect, enabling indirect control over memory bandwidth for cores over-utilizing bandwidth relative to their priority. For instance, high-priority cores may be run un-throttled, but lower priority cores generating an excessive amount of traffic may be throttled to enable more bandwidth availability for the high-priority cores.

Since MBA uses a programmable rate controller between the cores and the interconnect, higher-level shared caches and memory controller, bandwidth to these caches may also be reduced, so care should be taken to throttle only bandwidth-intense applications which do not use the off-core caches effectively.

The throttling values exposed by MBA are approximate, and are calibrated to specific traffic patterns. As work-load characteristics vary, the throttling values provided may affect each workload differently. In cases where precise control is needed, the Memory Bandwidth Monitoring (MBM) feature can be used as input to a software controller which makes decisions about the MBA throttling level to apply.

Enumeration and configuration details are discussed below followed by usage model considerations.

### 17.19.7.1 Memory Bandwidth Allocation Enumeration

Similar to other RDT features, enumeration of the presence and details of the MBA feature is provided via a sub-leaf of the CPUID instruction.

Key components of the enumeration are as follows.

- Support for the MBA feature on the processor, and if MBA is supported, the following details:
  - Number of supported Classes of Service (CLOS) for the processor.
  - The maximum MBA delay value supported (which also implicitly provides a definition of the granularity).
  - An indication of whether the delay values which can be programmed are linearly spaced or not.

The presence of any of the RDT features which enable control over shared platform resources is enumerated by executing CPUID instruction with EAX = 07H, ECX = 0H as input. If CPUID.(EAX=07H, ECX=0):EBX.PQE[bit 15] reports 1, the processor supports software control over shared processor resources. Software may then use CPUID leaf 10H to enumerate additional details on the specific controls provided.

Through CPUID leaf 10H software may determine whether MBA is supported on the platform. Specifically, as shown in Figure 17-31, bit 3 of the EBX register indicates whether MBA is supported on the processor, and the bit position (3) constitutes a Resource ID (ResID) which allows enumeration of MBA details. For instance, if bit 3 is supported this implies the presence of CPUID.10H.[ResID=3] as shown in Figure 17-38 which provides the following details.

- CPUID.(EAX=10H, ECX=ResID=3):EAX[11:0] reports the maximum MBA throttling value supported, minus one. For instance, a value of 89 indicates that a maximum throttling value of 90 is supported. Additionally, in cases where a linear interface (see below) is supported then one hundred minus the maximum throttling value indicates the granularity, 10% in this example.
- CPUID.(EAX=10H, ECX=ResID=3):EBX is reserved.
- CPUID.(EAX=10H, ECX=ResID=3):ECX[2] reports whether the response of the delay values is linear (see text).
- CPUID.(EAX=10H, ECX=ResID=3):EDX[15:0] reports the number of Classes of Service (CLOS) supported for the feature (minus one). For instance, a reported value of 15 implies a maximum of 16 supported MBA CLOS.

The number of CLOS supported for the MBA feature may or may not align with other resources such as L3 CAT. In cases where the RDT features support different numbers of CLOS the lowest numerical CLOS support the common set of features, while higher CLOS may support a subset. For instance, if L3 CAT supports 8 CLOS while MBA supports 4 CLOS, all 8 CLOS would have L3 CAT masks available for cache control, but the upper 4 CLOS would not offer MBA support. In this case the upper 4 CLOS would not be subject to any throttling control. Software can manage supported resources / CLOS in order to either have consistent capabilities across CLOS by using the common subset or enable more flexibility by selectively applying resource control where needed based on careful CLOS and thread mapping. In all cases, CLOS[0] supports all RDT resource control features present on the platform.

Discussion on the interpretation and usage of the MBA delay values is provided in Section 17.19.7.2 on MBA configuration.

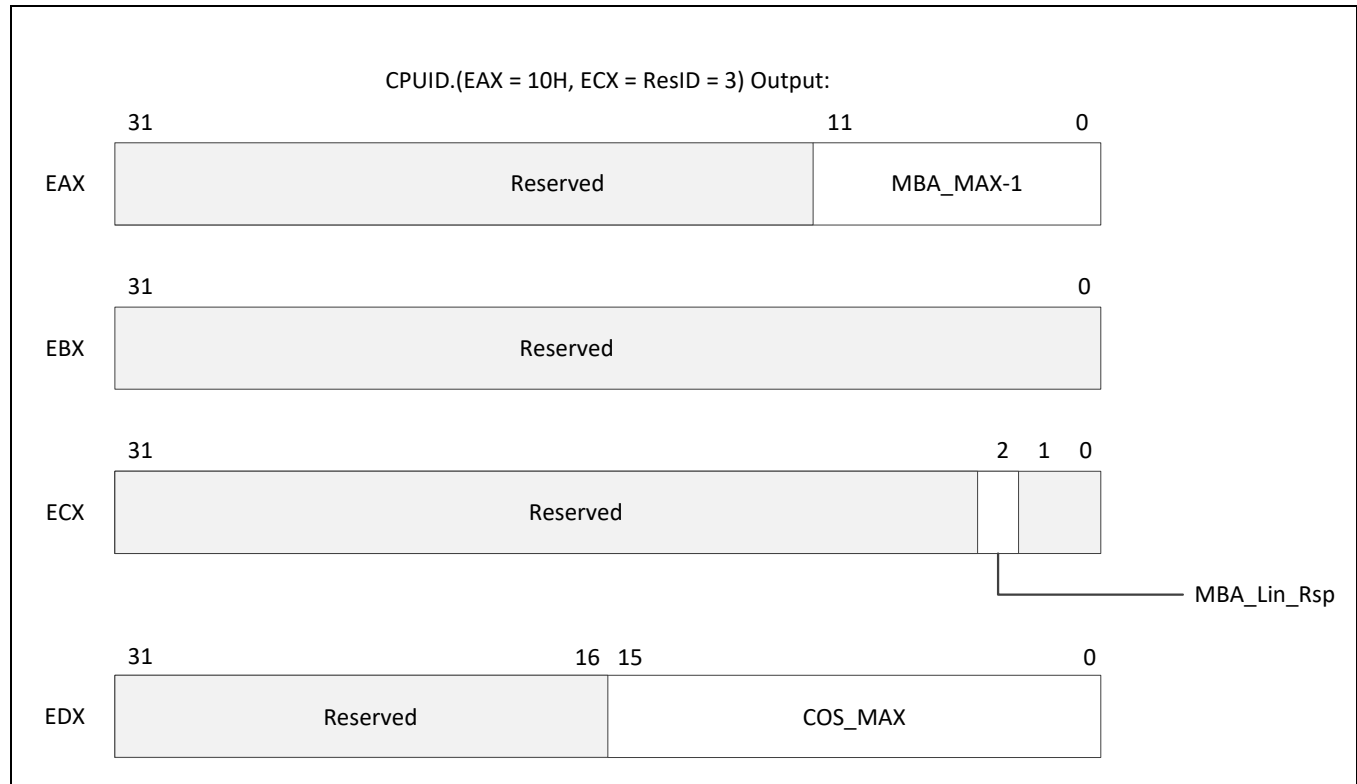

Figure 17-39. CPUID.(EAX=10H, ECX=3H) MBA Feature Details Identification

17.19.7.2 Memory Bandwidth Allocation Configuration

The configuration of MBA takes consists of two processes once enumeration is complete.

- Association of threads to Classes of Service (CLOS) - accomplished in a common fashion across RDT features as described in Section 17.19.7.1 via the IA32\_PQR\_ASSOC MSR. As with features such as L3 CAT, software may update the CLOS field of the PQR MSR at context swap time in order to maintain the proper association of software threads to Classes of Service on the hardware. While logical processors may each be associated with independent CLOS, see Section 17.19.7.3 for important usage model considerations (initial versions of the MBA feature select the maximum delay value across threads).
- Configuration of the per-CLOS delay values, accomplished via the IA32\_L2\_QoS\_Ext\_BW\_Thrtl\_n MSR set shown in Table 17-20.

The MBA delay values which may be programmed range from zero (implying zero delay, and full bandwidth available) to the maximum (MBA\_MAX) specified in CPUID as discussed in Section 17.19.7.1. The throttling values are approximate and do not sum to 100% across CLOS, rather they should be viewed as a maximum bandwidth "cap" per-CLOS.

Software may select an MBA delay value then write the value into one or more of the IA32\_L2\_QoS\_Ext\_BW\_Thrtl\_n MSRs to update the delay values applied for a specific CLOS. As shown in Table 17.20 the base address of the MSRs is at D50H, and the range corresponds to the maximum supported CLOS from CPUID.(EAX=10H, ECX=ResID=1):EDX[15:0] as described in Section 17.19.7.1. For instance, if 16 CLOS are supported then the valid MSR range will extend from D50H through D5F inclusive.

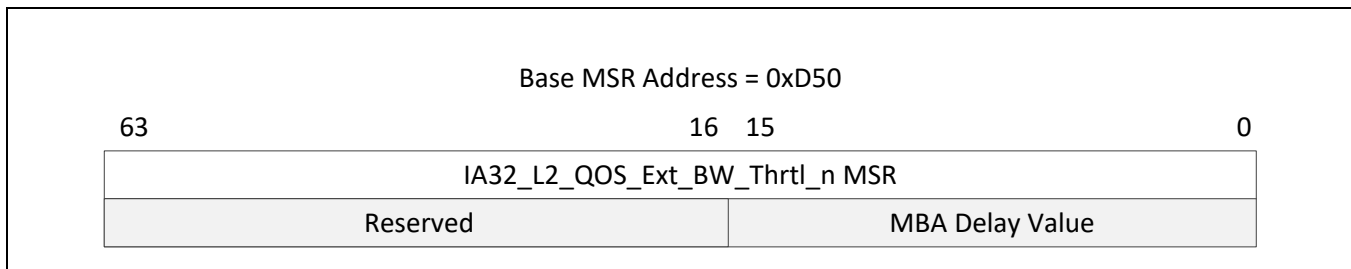

**Table 17-20. MBA Delay Value MSRs**

| Delay Value MSR                    | Address                         |
|------------------------------------|---------------------------------|
| IA32_L2_QoS_Ext_BW_Thrtl_0         | D50H                            |
| IA32_L2_QoS_Ext_BW_Thrtl_1         | D51H                            |
| IA32_L2_QoS_Ext_BW_Thrtl_2         | D52H                            |
| ....                               | ....                            |
| IA32_L2_QoS_Ext_BW_Thrtl_'COS_MAX' | D50H + COS_MAX from CPUID.10H.3 |

The definition for the MBA delay value MSRs is provided in Figure 17.39. The lower 16 bits are used for MBA delay values, and values from zero to the maximum from the CPUID MBA\_MAX-1 value are supported. Values outside this range will generate #GP(0).

If linear input throttling values are indicated by CPUID.(EAX=10H, ECX=ResID=3):ECX[bit 2] then values from zero through the MBA\_MAX field from CPUID.(EAX=10H, ECX=ResID=3):EAX[11:0] are supported as inputs. In the linear mode the input precision is defined as  $100 - (\text{MBA\_MAX})$ . For instance, if the MBA\_MAX value is 90, the input precision is 10%. Values not an even multiple of the precision (e.g., 12%) will be rounded down (e.g., to 10% delay applied).

- If linear values are not supported (CPUID.(EAX=10H, ECX=ResID=3):ECX[bit 2] = 0) then input delay values are powers-of-two from zero to the MBA\_MAX value from CPUID. In this case any values not a power of two will be rounded down the next nearest power of two.

**Figure 17-40. IA32\_L2\_QoS\_Ext\_BW\_Thrtl\_n MSR Definition**

Note that the throttling values provided to software are calibrated through specific traffic patterns, however as workload characteristics may vary the response precision and linearity of the delay values will vary across products, and should be treated as approximate values only.

### 17.19.7.3 Memory Bandwidth Allocation Usage Considerations

As the memory bandwidth control that MBA provides is indirect and approximate, using the feature with a closed-loop controller to also monitor memory bandwidth and how effectively the applications use the cache (via the Cache Monitoring Technology feature) may provide additional value. This approach also allows administrators to provide a band-width target or set-point which a controller could use to guide MBA throttling values applied, and this allows bandwidth control independent of the execution characteristics of the application.

As control is provided per processor core (the max of the delay values of the per-thread CLOS applied to the core) care should be taking in scheduling threads so as to not inadvertently place a high-priority thread (with zero intended MBA throttling) next to a low-priority thread (with MBA throttling intended), which would lead to inadvertent throttling of the high-priority thread.

## 18. Updates to Chapter 18, Volume 3B

Change bars show changes to Chapter 18 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B: System Programming Guide, Part 2*.

-----

Change to chapter: Updated FREEZE\_WHILE\_SMM name.

Intel 64 and IA-32 architectures provide facilities for monitoring performance via a PMU (Performance Monitoring Unit).

### 18.1 PERFORMANCE MONITORING OVERVIEW

Performance monitoring was introduced in the Pentium processor with a set of model-specific performance-monitoring counter MSRs. These counters permit selection of processor performance parameters to be monitored and measured. The information obtained from these counters can be used for tuning system and compiler performance.

In Intel P6 family of processors, the performance monitoring mechanism was enhanced to permit a wider selection of events to be monitored and to allow greater control events to be monitored. Next, Intel processors based on Intel NetBurst microarchitecture introduced a distributed style of performance monitoring mechanism and performance events.

The performance monitoring mechanisms and performance events defined for the Pentium, P6 family, and Intel processors based on Intel NetBurst microarchitecture are not architectural. They are all model specific (not compatible among processor families). Intel Core Solo and Intel Core Duo processors support a set of architectural performance events and a set of non-architectural performance events. Newer Intel processor generations support enhanced architectural performance events and non-architectural performance events.

Starting with Intel Core Solo and Intel Core Duo processors, there are two classes of performance monitoring capabilities. The first class supports events for monitoring performance using counting or interrupt-based event sampling usage. These events are non-architectural and vary from one processor model to another. They are similar to those available in Pentium M processors. These non-architectural performance monitoring events are specific to the microarchitecture and may change with enhancements. They are discussed in Section 18.6.3, "Performance Monitoring (Processors Based on Intel NetBurst® Microarchitecture)." Non-architectural events for a given microarchitecture cannot be enumerated using CPUID; and they are listed in Chapter 19, "Performance Monitoring Events."

The second class of performance monitoring capabilities is referred to as architectural performance monitoring. This class supports the same counting and Interrupt-based event sampling usages, with a smaller set of available events. The visible behavior of architectural performance events is consistent across processor implementations. Availability of architectural performance monitoring capabilities is enumerated using the CPUID.0AH. These events are discussed in Section 18.2.

## 18.2 ARCHITECTURAL PERFORMANCE MONITORING

Performance monitoring events are architectural when they behave consistently across microarchitectures. Intel Core Solo and Intel Core Duo processors introduced architectural performance monitoring. The feature provides a mechanism for software to enumerate performance events and provides configuration and counting facilities for events.

Architectural performance monitoring does allow for enhancement across processor implementations. The CPUID.0AH leaf provides version ID for each enhancement. Intel Core Solo and Intel Core Duo processors support base level functionality identified by version ID of 1. Processors based on Intel Core microarchitecture support, at a minimum, the base level functionality of architectural performance monitoring. Intel Core 2 Duo processor T 7700 and newer processors based on Intel Core microarchitecture support both the base level functionality and enhanced architectural performance monitoring identified by version ID of 2.

45 nm and 32 nm Intel Atom processors and Intel Atom processors based on the Silvermont microarchitecture support the functionality provided by versionID 1, 2, and 3; CPUID.0AH:EAX[7:0] reports versionID = 3 to indicate the aggregate of architectural performance monitoring capabilities. Intel Atom processors based on the Airmont microarchitecture support the same performance monitoring capabilities as those based on the Silvermont microarchitecture.

Intel Core processors and related Intel Xeon processor families based on the Nehalem through Broadwell microarchitectures support version ID 1, 2, and 3. Intel processors based on the Skylake and Kaby Lake microarchitectures support versionID 4.

Next generation Intel Atom processors are based on the Goldmont microarchitecture. Intel processors based on the Goldmont microarchitecture support versionID 4.

## 18.2.1 Architectural Performance Monitoring Version 1

Configuring an architectural performance monitoring event involves programming performance event select registers. There are a finite number of performance event select MSRs (IA32\_PERFEVTSELx MSRs). The result of a performance monitoring event is reported in a performance monitoring counter (IA32\_PMCx MSR). Performance monitoring counters are paired with performance monitoring select registers.

Performance monitoring select registers and counters are architectural in the following respects:

- Bit field layout of IA32\_PERFEVTSELx is consistent across microarchitectures.
- Addresses of IA32\_PERFEVTSELx MSRs remain the same across microarchitectures.
- Addresses of IA32\_PMC MSRs remain the same across microarchitectures.
- Each logical processor has its own set of IA32\_PERFEVTSELx and IA32\_PMCx MSRs. Configuration facilities and counters are not shared between logical processors sharing a processor core.

Architectural performance monitoring provides a CPUID mechanism for enumerating the following information:

- Number of performance monitoring counters available in a logical processor (each IA32\_PERFEVTSELx MSR is paired to the corresponding IA32\_PMCx MSR)
- Number of bits supported in each IA32\_PMCx
- Number of architectural performance monitoring events supported in a logical processor

Software can use CPUID to discover architectural performance monitoring availability (CPUID.0AH). The architectural performance monitoring leaf provides an identifier corresponding to the version number of architectural performance monitoring available in the processor.

The version identifier is retrieved by querying CPUID.0AH:EAX[bits 7:0] (see Chapter 3, “Instruction Set Reference, A-L,” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2A*). If the version identifier is greater than zero, architectural performance monitoring capability is supported. Software queries the CPUID.0AH for the version identifier first; it then analyzes the value returned in CPUID.0AH:EAX, CPUID.0AH:EBX to determine the facilities available.

In the initial implementation of architectural performance monitoring; software can determine how many IA32\_PERFEVTSELx/ IA32\_PMCx MSR pairs are supported per core, the bit-width of PMC, and the number of architectural performance monitoring events available.

### 18.2.1.1 Architectural Performance Monitoring Version 1 Facilities

Architectural performance monitoring facilities include a set of performance monitoring counters and performance event select registers. These MSRs have the following properties:

- IA32\_PMCx MSRs start at address 0C1H and occupy a contiguous block of MSR address space; the number of MSRs per logical processor is reported using CPUID.0AH:EAX[15:8].
- IA32\_PERFEVTSELx MSRs start at address 186H and occupy a contiguous block of MSR address space. Each performance event select register is paired with a corresponding performance counter in the 0C1H address block.
- The bit width of an IA32\_PMCx MSR is reported using the CPUID.0AH:EAX[23:16]. This the number of valid bits for read operation. On write operations, the lower-order 32 bits of the MSR may be written with any value, and the high-order bits are sign-extended from the value of bit 31.
- Bit field layout of IA32\_PERFEVTSELx MSRs is defined architecturally.

See Figure 18-1 for the bit field layout of IA32\_PERFEVTSELx MSRs. The bit fields are:

- **Event select field (bits 0 through 7)** — Selects the event logic unit used to detect microarchitectural conditions (see Table 18-1, for a list of architectural events and their 8-bit codes). The set of values for this field is defined architecturally; each value corresponds to an event logic unit for use with an architectural performance event. The number of architectural events is queried using CPUID.0AH:EAX. A processor may support only a subset of pre-defined values.

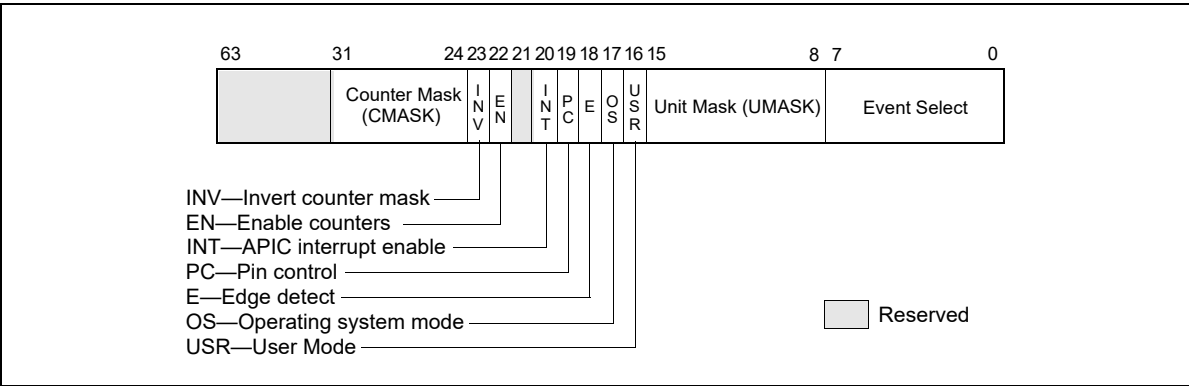

Figure 18-1. Layout of IA32\_PERFEVTSELx MSRs

- **Unit mask (UMASK) field (bits 8 through 15)** — These bits qualify the condition that the selected event logic unit detects. Valid UMASK values for each event logic unit are specific to the unit. For each architectural performance event, its corresponding UMASK value defines a specific microarchitectural condition.

A pre-defined microarchitectural condition associated with an architectural event may not be applicable to a given processor. The processor then reports only a subset of pre-defined architectural events. Pre-defined architectural events are listed in Table 18-1; support for pre-defined architectural events is enumerated using CPUID.0AH:EBX. Architectural performance events available in the initial implementation are listed in Table 19-1.

- **USR (user mode) flag (bit 16)** — Specifies that the selected microarchitectural condition is counted when the logical processor is operating at privilege levels 1, 2 or 3. This flag can be used with the OS flag.
- **OS (operating system mode) flag (bit 17)** — Specifies that the selected microarchitectural condition is counted when the logical processor is operating at privilege level 0. This flag can be used with the USR flag.
- **E (edge detect) flag (bit 18)** — Enables (when set) edge detection of the selected microarchitectural condition. The logical processor counts the number of deasserted to asserted transitions for any condition that can be expressed by the other fields. The mechanism does not permit back-to-back assertions to be distinguished.

This mechanism allows software to measure not only the fraction of time spent in a particular state, but also the average length of time spent in such a state (for example, the time spent waiting for an interrupt to be serviced).

- **PC (pin control) flag (bit 19)** — When set, the logical processor toggles the PM*i* pins and increments the counter when performance-monitoring events occur; when clear, the processor toggles the PM*i* pins when the counter overflows. The toggling of a pin is defined as assertion of the pin for a single bus clock followed by deassertion.
- **INT (APIC interrupt enable) flag (bit 20)** — When set, the logical processor generates an exception through its local APIC on counter overflow.
- **EN (Enable Counters) Flag (bit 22)** — When set, performance counting is enabled in the corresponding performance-monitoring counter; when clear, the corresponding counter is disabled. The event logic unit for a UMASK must be disabled by setting IA32\_PERFEVTSELx[bit 22] = 0, before writing to IA32\_PMCx.
- **INV (invert) flag (bit 23)** — When set, inverts the counter-mask (CMASK) comparison, so that both greater than or equal to and less than comparisons can be made (0: greater than or equal; 1: less than). Note if counter-mask is programmed to zero, INV flag is ignored.

- **Counter mask (CMASK) field (bits 24 through 31)** — When this field is not zero, a logical processor compares this mask to the events count of the detected microarchitectural condition during a single cycle. If the event count is greater than or equal to this mask, the counter is incremented by one. Otherwise the counter is not incremented.

This mask is intended for software to characterize microarchitectural conditions that can count multiple occurrences per cycle (for example, two or more instructions retired per clock; or bus queue occupations). If the counter-mask field is 0, then the counter is incremented each cycle by the event count associated with multiple occurrences.

### 18.2.1.2 Pre-defined Architectural Performance Events

Table 18-1 lists architecturally defined events.

**Table 18-1. UMask and Event Select Encodings for Pre-Defined Architectural Performance Events**

| Bit Position<br>CPUID.AH.EBX | Event Name                 | UMask | Event Select |
|------------------------------|----------------------------|-------|--------------|
| 0                            | UnHalted Core Cycles       | 00H   | 3CH          |
| 1                            | Instruction Retired        | 00H   | C0H          |
| 2                            | UnHalted Reference Cycles  | 01H   | 3CH          |
| 3                            | LLC Reference              | 4FH   | 2EH          |
| 4                            | LLC Misses                 | 41H   | 2EH          |
| 5                            | Branch Instruction Retired | 00H   | C4H          |
| 6                            | Branch Misses Retired      | 00H   | C5H          |

A processor that supports architectural performance monitoring may not support all the predefined architectural performance events (Table 18-1). The non-zero bits in CPUID.0AH:EBX indicate the events that are not available.

The behavior of each architectural performance event is expected to be consistent on all processors that support that event. Minor variations between microarchitectures are noted below:

- **UnHalted Core Cycles** — Event select 3CH, Umask 00H

This event counts core clock cycles when the clock signal on a specific core is running (not halted). The counter does not advance in the following conditions:

- an ACPI C-state other than C0 for normal operation
- HLT
- STPCLK# pin asserted
- being throttled by TM1
- during the frequency switching phase of a performance state transition (see Chapter 14, “Power and Thermal Management”)

The performance counter for this event counts across performance state transitions using different core clock frequencies

- **Instructions Retired** — Event select C0H, Umask 00H

This event counts the number of instructions at retirement. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. An instruction with a REP prefix counts as one instruction (not per iteration). Faults before the retirement of the last micro-op of a multi-ops instruction are not counted.

This event does not increment under VM-exit conditions. Counters continue counting during hardware interrupts, traps, and inside interrupt handlers.

- **UnHalted Reference Cycles** — Event select 3CH, Umask 01H

This event counts reference clock cycles at a fixed frequency while the clock signal on the core is running. The event counts at a fixed frequency, irrespective of core frequency changes due to performance state transitions. Processors may implement this behavior differently. Current implementations use the core crystal clock, TSC or the bus clock. Because the rate may differ between implementations, software should calibrate it to a time source with known frequency.

- **Last Level Cache References** — Event select 2EH, Umask 4FH

This event counts requests originating from the core that reference a cache line in the last level on-die cache. The event count includes speculation and cache line fills due to the first-level cache hardware prefetcher, but may exclude cache line fills due to other hardware-prefetchers.

Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.

- **Last Level Cache Misses** — Event select 2EH, Umask 41H

This event counts each cache miss condition for references to the last level on-die cache. The event count may include speculation and cache line fills due to the first-level cache hardware prefetcher, but may exclude cache line fills due to other hardware-prefetchers.

Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.

- **Branch Instructions Retired** — Event select C4H, Umask 00H

This event counts branch instructions at retirement. It counts the retirement of the last micro-op of a branch instruction.

- **All Branch Mispredict Retired** — Event select C5H, Umask 00H

This event counts mispredicted branch instructions at retirement. It counts the retirement of the last micro-op of a branch instruction in the architectural path of execution and experienced misprediction in the branch prediction hardware.

Branch prediction hardware is implementation-specific across microarchitectures; value comparison to estimate performance differences is not recommended.

### NOTE

Programming decisions or software precisians on functionality should not be based on the event values or dependent on the existence of performance monitoring events.

## 18.2.2 Architectural Performance Monitoring Version 2

The enhanced features provided by architectural performance monitoring version 2 include the following:

- **Fixed-function performance counter register and associated control register** — Three of the architectural performance events are counted using three fixed-function MSRs (IA32\_FIXED\_CTR0 through IA32\_FIXED\_CTR2). Each of the fixed-function PMC can count only one architectural performance event.

Configuring the fixed-function PMCs is done by writing to bit fields in the MSR (IA32\_FIXED\_CTR\_CTRL) located at address 38DH. Unlike configuring performance events for general-purpose PMCs (IA32\_PMCx) via UMASK field in (IA32\_PERFECTSELx), configuring, programming IA32\_FIXED\_CTR\_CTRL for fixed-function PMCs do not require any UMASK.

- **Simplified event programming** — Most frequent operation in programming performance events are enabling/disabling event counting and checking the status of counter overflows. Architectural performance event version 2 provides three architectural MSRs:
  - IA32\_PERF\_GLOBAL\_CTRL allows software to enable/disable event counting of all or any combination of fixed-function PMCs (IA32\_FIXED\_CTRx) or any general-purpose PMCs via a single WRMSR.
  - IA32\_PERF\_GLOBAL\_STATUS allows software to query counter overflow conditions on any combination of fixed-function PMCs or general-purpose PMCs via a single RDMSR.
  - IA32\_PERF\_GLOBAL\_OVF\_CTRL allows software to clear counter overflow conditions on any combination of fixed-function PMCs or general-purpose PMCs via a single WRMSR.
- **PMI Overhead Mitigation** — Architectural performance monitoring version 2 introduces two bit field interface in IA32\_DEBUGCTL for PMI service routine to accumulate performance monitoring data and LBR records with reduced perturbation from servicing the PMI. The two bit fields are:
  - IA32\_DEBUGCTL.Freeze\_LBR\_On\_PMI(bit 11). In architectural performance monitoring version 2, only the legacy semantic behavior is supported. See Section 17.4.7 for details of the legacy Freeze LBRs on PMI control.
  - IA32\_DEBUGCTL.Freeze\_PerfMon\_On\_PMI(bit 12). In architectural performance monitoring version 2, only the legacy semantic behavior is supported. See Section 17.4.7 for details of the legacy Freeze LBRs on PMI control.

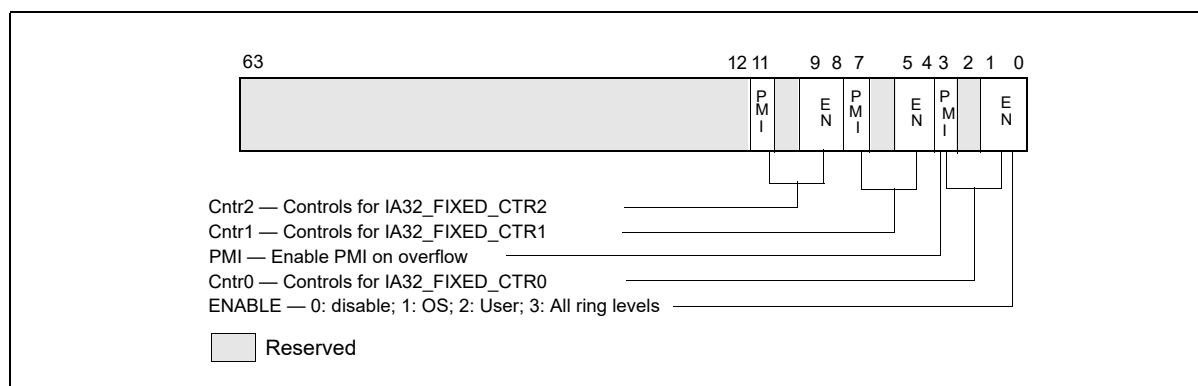

The facilities provided by architectural performance monitoring version 2 can be queried from CPUID leaf 0AH by examining the content of register EDX:

- Bits 0 through 4 of CPUID.0AH.EDX indicates the number of fixed-function performance counters available per core,
- Bits 5 through 12 of CPUID.0AH.EDX indicates the bit-width of fixed-function performance counters. Bits beyond the width of the fixed-function counter are reserved and must be written as zeros.

#### NOTE

Early generation of processors based on Intel Core microarchitecture may report in CPUID.0AH:EDX of support for version 2 but indicating incorrect information of version 2 facilities.

The IA32\_FIXED\_CTR\_CTRL MSR include multiple sets of 4-bit field, each 4 bit field controls the operation of a fixed-function performance counter. Figure 18-2 shows the layout of 4-bit controls for each fixed-function PMC. Two sub-fields are currently defined within each control. The definitions of the bit fields are:

**Figure 18-2. Layout of IA32\_FIXED\_CTR\_CTRL MSR**

- **Enable field (lowest 2 bits within each 4-bit control)** — When bit 0 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment while the target condition associated with the architecture performance event occurred at ring 0. When bit 1 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment while the target condition associated with the architecture performance event occurred at ring greater than 0. Writing 0 to both bits stops the performance counter. Writing a value of 11B enables the counter to increment irrespective of privilege levels.
- **PMI field (the fourth bit within each 4-bit control)** — When set, the logical processor generates an exception through its local APIC on overflow condition of the respective fixed-function counter.

IA32\_PERF\_GLOBAL\_CTRL MSR provides single-bit controls to enable counting of each performance counter. Figure 18-3 shows the layout of IA32\_PERF\_GLOBAL\_CTRL. Each enable bit in IA32\_PERF\_GLOBAL\_CTRL is AND'ed with the enable bits for all privilege levels in the respective IA32\_PERFEVTSELx or IA32\_PERF\_FIXED\_CTR\_CTRL MSRs to start/stop the counting of respective counters. Counting is enabled if the AND'ed results is true; counting is disabled when the result is false.

Figure 18-3. Layout of IA32\_PERF\_GLOBAL\_CTRL MSR

The behavior of the fixed function performance counters supported by architectural performance version 2 is expected to be consistent on all processors that support those counters, and is defined as follows.

**Table 18-2. Association of Fixed-Function Performance Counters with Architectural Performance Events**

| Fixed-Function Performance Counter  | Address | Event Mask Mnemonic                              | Description   |
|-------------------------------------|---------|--|---|
| MSR_PERF_FIXED_CTR0/IA32_FIXED_CTR0 | 309H    | INST_RETIRED.ANY                                 | This event counts the number of instructions that retire execution. For instructions that consist of multiple uops, this event counts the retirement of the last uop of the instruction. The counter continues counting during hardware interrupts, traps, and in-side interrupt handlers.  |
| MSR_PERF_FIXED_CTR1/IA32_FIXED_CTR1 | 30AH    | CPU_CLK_UNHALTED.THREAD<br>CPU_CLK_UNHALTED.CORE | The CPU_CLK_UNHALTED.THREAD event counts the number of core cycles while the logical processor is not in a halt state.<br><br>If there is only one logical processor in a processor core, CPU_CLK_UNHALTED.CORE counts the unhalted cycles of the processor core.<br><br>The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time.        |
| MSR_PERF_FIXED_CTR2/IA32_FIXED_CTR2 | 30BH    | CPU_CLK_UNHALTED.REF_TSC                         | This event counts the number of reference cycles at the TSC rate when the core is not in a halt state and not in a TM stop-clock state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction. This event is not affected by core frequency changes (e.g., P states) but counts at the same frequency as the time stamp counter. This event can approximate elapsed time while the core was not in a halt state and not in a TM stopclock state. |

IA32\_PERF\_GLOBAL\_STATUS MSR provides single-bit status for software to query the overflow condition of each performance counter. IA32\_PERF\_GLOBAL\_STATUS[bit 62] indicates overflow conditions of the DS area data buffer. IA32\_PERF\_GLOBAL\_STATUS[bit 63] provides a CondChgd bit to indicate changes to the state of performance monitoring hardware. Figure 18-4 shows the layout of IA32\_PERF\_GLOBAL\_STATUS. A value of 1 in bits 0, 1, 32 through 34 indicates a counter overflow condition has occurred in the associated counter.

When a performance counter is configured for PEBS, overflow condition in the counter generates a performance-monitoring interrupt signaling a PEBS event. On a PEBS event, the processor stores data records into the buffer area (see Section 18.15.5), clears the counter overflow status., and sets the "OvfBuffer" bit in IA32\_PERF\_GLOBAL\_STATUS.

Figure 18-4. Layout of IA32\_PERF\_GLOBAL\_STATUS MSR

IA32\_PERF\_GLOBAL\_OVF\_CTL MSR allows software to clear overflow indicator(s) of any general-purpose or fixed-function counters via a single WRMSR. Software should clear overflow indications when

- Setting up new values in the event select and/or UMASK field for counting or interrupt-based event sampling.
- Reloading counter values to continue collecting next sample.
- Disabling event counting or interrupt-based event sampling.

The layout of IA32\_PERF\_GLOBAL\_OVF\_CTL is shown in Figure 18-5.

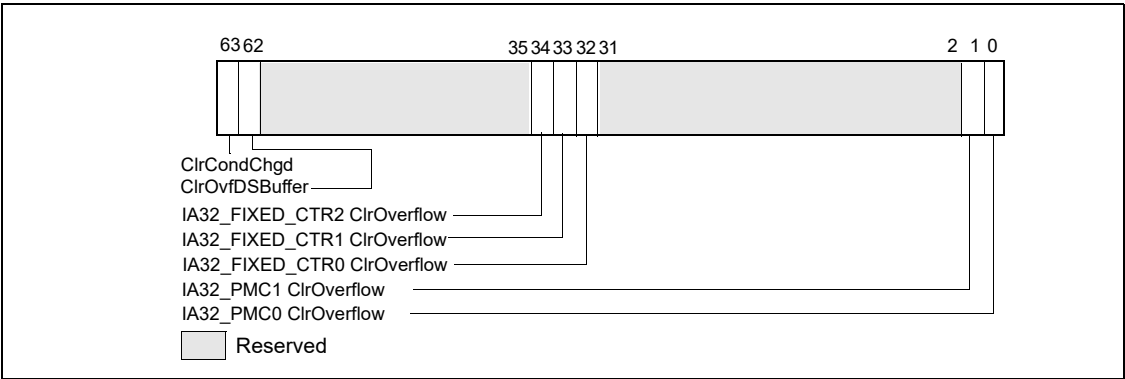

Figure 18-5. Layout of IA32\_PERF\_GLOBAL\_OVF\_CTRL MSR

### 18.2.3 Architectural Performance Monitoring Version 3

Processors supporting architectural performance monitoring version 3 also supports version 1 and 2, as well as capability enumerated by CPUID leaf 0AH. Specifically, version 3 provides the following enhancement in performance monitoring facilities if a processor core comprising of more than one logical processor, i.e. a processor core supporting Intel Hyper-Threading Technology or simultaneous multi-threading capability:

- AnyThread counting for processor core supporting two or more logical processors. The interface that supports AnyThread counting include:
  - Each IA32\_PERFEVTSELx MSR (starting at MSR address 186H) support the bit field layout defined in Figure 18-6.

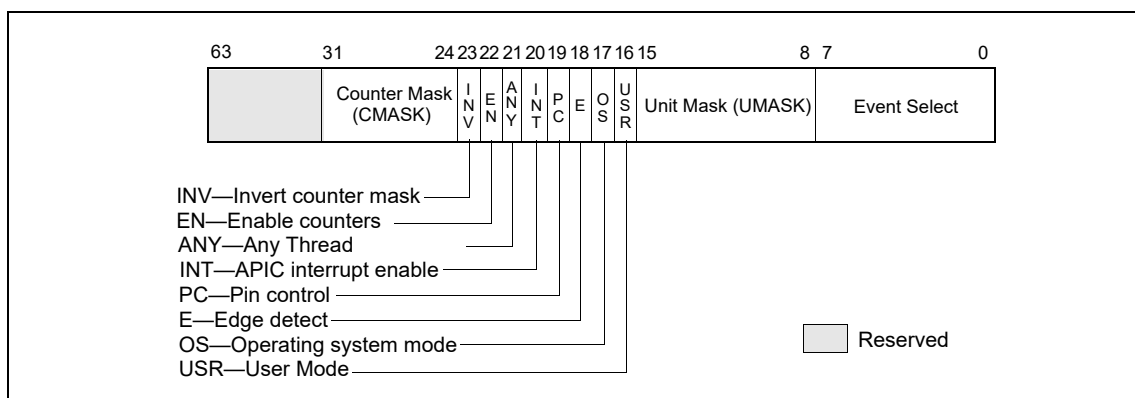

Figure 18-6. Layout of IA32\_PERFEVTSELx MSRs Supporting Architectural Performance Monitoring Version 3

Bit 21 (**AnyThread**) of IA32\_PERFEVTSELx is supported in architectural performance monitoring version 3 for processor core comprising of two or more logical processors. When set to 1, it enables counting the associated event conditions (including matching the thread's CPL with the OS/USR setting of IA32\_PERFEVTSELx) occurring across all logical processors sharing a processor core. When bit 21 is 0, the counter only increments the associated event conditions (including matching the thread's CPL with the OS/USR setting of IA32\_PERFEVTSELx) occurring in the logical processor which programmed the IA32\_PERFEVTSELx MSR.

- Each fixed-function performance counter IA32\_FIXED\_CTRx (starting at MSR address 309H) is configured by a 4-bit control block in the IA32\_PERF\_FIXED\_CTR\_CTRL MSR. The control block also allow thread-specificity configuration using an AnyThread bit. The layout of IA32\_PERF\_FIXED\_CTR\_CTRL MSR is shown.

Figure 18-7. IA32\_FIXED\_CTR\_CTRL MSR Supporting Architectural Performance Monitoring Version 3

Each control block for a fixed-function performance counter provides a **AnyThread** (bit position  $2 + 4*N$ ,  $N = 0, 1$ , etc.) bit. When set to 1, it enables counting the associated event conditions (including matching the thread's CPL with the ENABLE setting of the corresponding control block of IA32\_PERF\_FIXED\_CTR\_CTRL) occurring across all logical processors sharing a processor core. When an **AnyThread** bit is 0 in IA32\_PERF\_FIXED\_CTR\_CTRL, the corresponding fixed counter only increments the associated event conditions occurring in the logical processor which programmed the IA32\_PERF\_FIXED\_CTR\_CTRL MSR.

- The IA32\_PERF\_GLOBAL\_CTRL, IA32\_PERF\_GLOBAL\_STATUS, IA32\_PERF\_GLOBAL\_OVF\_CTRL MSRs provide single-bit controls/status for each general-purpose and fixed-function performance counter. Figure 18-8 and Figure 18-9 show the layout of these MSRs for N general-purpose performance counters (where N is reported by CPUID.0AH:EAX[15:8]) and three fixed-function counters.

**Note:** The number of general-purpose performance monitoring counters (i.e. N in Figure 18-9) can vary across processor generations within a processor family, across processor families, or could be different depending on the configuration chosen at boot time in the BIOS regarding Intel Hyper Threading Technology, (e.g. N=2 for 45 nm Intel Atom processors; N =4 for processors based on the Nehalem microarchitecture; for processors based on the Sandy Bridge microarchitecture, N = 4 if Intel Hyper Threading Technology is active and N=8 if not active).

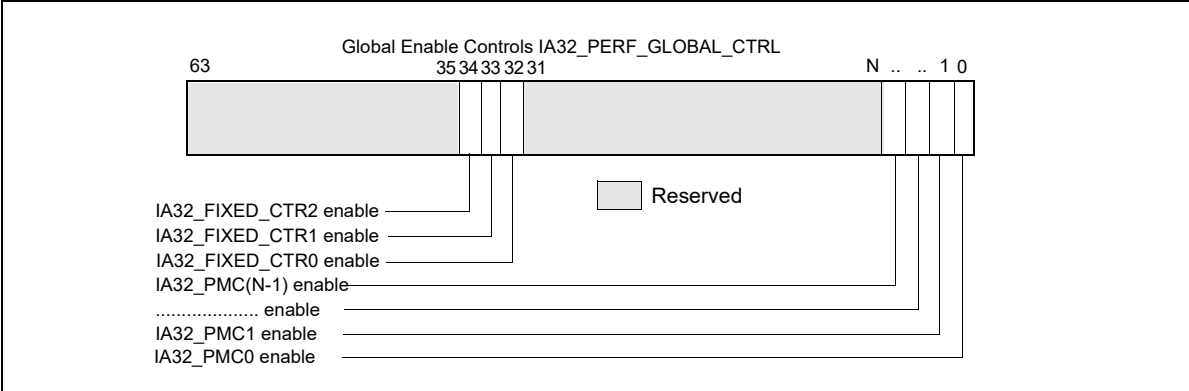

Figure 18-8. Layout of Global Performance Monitoring Control MSR

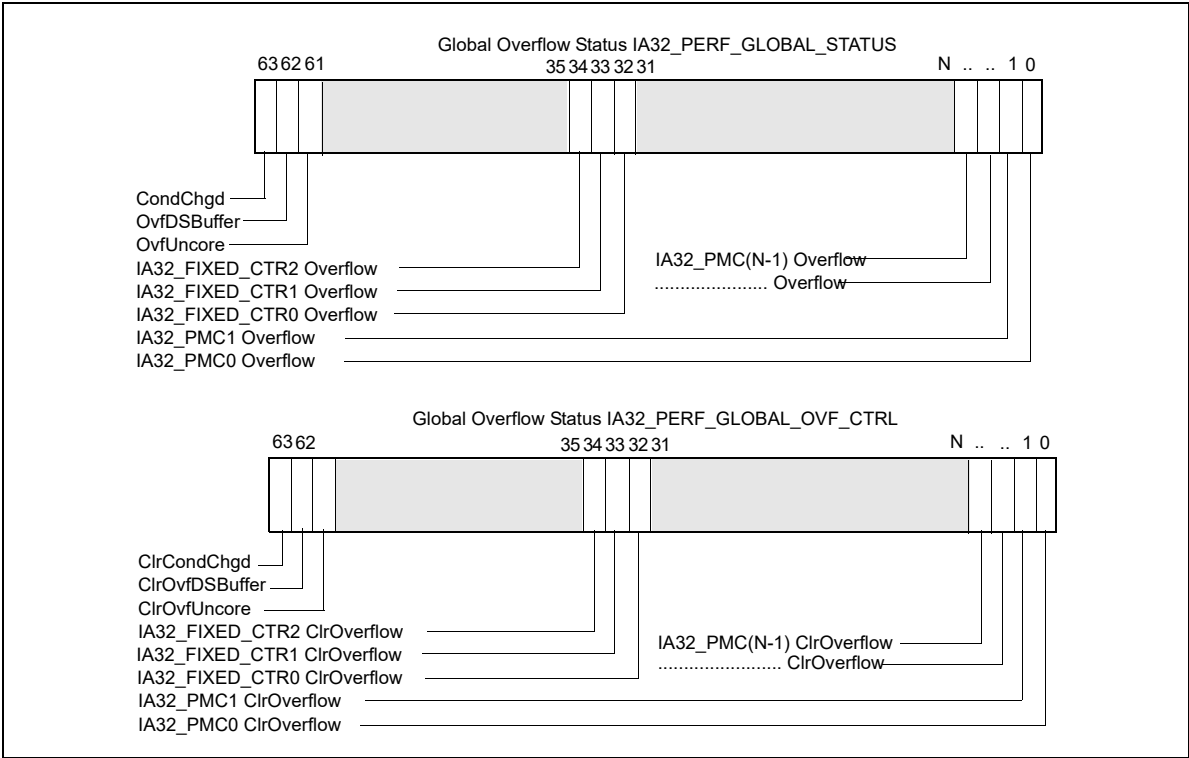

Figure 18-9. Global Performance Monitoring Overflow Status and Control MSRs

### 18.2.3.1 AnyThread Counting and Software Evolution

The motivation for characterizing software workload over multiple software threads running on multiple logical processors of the same processor core originates from a time earlier than the introduction of the AnyThread interface in IA32\_PERFEVTSELx and IA32\_FIXED\_CTR\_CTRL. While AnyThread counting provides some benefits in simple software environments of an earlier era, the evolution contemporary software environments introduce certain concepts and pre-requisites that AnyThread counting does not comply with.

One example is the proliferation of software environments that support multiple virtual machines (VM) under VMX (see Chapter 23, “Introduction to Virtual-Machine Extensions”) where each VM represents a domain separated from one another.

A Virtual Machine Monitor (VMM) that manages the VMs may allow individual VM to employ performance monitoring facilities to profiles the performance characteristics of a workload. The use of the Anythread interface in IA32\_PERFEVTSELx and IA32\_FIXED\_CTR\_CTRL is discouraged with software environments supporting virtualization or requiring domain separation.

Specifically, Intel recommends VMM:

- configure the MSR bitmap to cause VM-exits for WRMSR to IA32\_PERFEVTSELx and IA32\_FIXED\_CTR\_CTRL in VMX non-Root operation (see CHAPTER 24 for additional information),
- clear the AnyThread bit of IA32\_PERFEVTSELx and IA32\_FIXED\_CTR\_CTRL in the MSR-load lists for VM exits and VM entries (see CHAPTER 24, CHAPTER 26, and CHAPTER 27).

Even when operating in simpler legacy software environments which might not emphasize the pre-requisites of a virtualized software environment, the use of the AnyThread interface should be moderated and follow any event-specific guidance where explicitly noted (see relevant sections of Chapter 19, “Performance Monitoring Events”).

### 18.2.4 Architectural Performance Monitoring Version 4

Processors supporting architectural performance monitoring version 4 also supports version 1, 2, and 3, as well as capability enumerated by CPUID leaf 0AH. Version 4 introduced a streamlined PMI overhead mitigation interface that replaces the legacy semantic behavior but retains the same control interface in IA32\_DEBUGCTL.Freeze\_LBRs\_On\_PMI and Freeze\_PerfMon\_On\_PMI. Specifically version 4 provides the following enhancement:

- New indicators (LBR\_FRZ, CTR\_FRZ) in IA32\_PERF\_GLOBAL\_STATUS, see Section 18.2.4.1.
- Streamlined Freeze/PMI Overhead management interfaces to use IA32\_DEBUGCTL.Freeze\_LBRs\_On\_PMI and IA32\_DEBUGCTL.Freeze\_PerfMon\_On\_PMI: see Section 18.2.4.1. Legacy semantics of Freeze\_LBRs\_On\_PMI and Freeze\_PerfMon\_On\_PMI (applicable to version 2 and 3) are not supported with version 4 or higher.
- Fine-grain separation of control interface to manage overflow/status of IA32\_PERF\_GLOBAL\_STATUS and read-only performance counter enabling interface in IA32\_PERF\_GLOBAL\_STATUS: see Section 18.2.4.2.
- Performance monitoring resource in-use MSR to facilitate cooperative sharing protocol between perfmon-managing privilege agents.

#### 18.2.4.1 Enhancement in IA32\_PERF\_GLOBAL\_STATUS

The IA32\_PERF\_GLOBAL\_STATUS MSR provides the following indicators with architectural performance monitoring version 4:

- IA32\_PERF\_GLOBAL\_STATUS.LBR\_FRZ[bit 58]: This bit is set due to the following conditions:
  - IA32\_DEBUGCTL.FREEZE\_LBR\_ON\_PMI has been set by the profiling agent, and
  - A performance counter, configured to generate PMI, has overflowed to signal a PMI. Consequently the LBR stack is frozen.

Effectively, the IA32\_PERF\_GLOBAL\_STATUS.LBR\_FRZ bit also serve as an read-only control to enable capturing data in the LBR stack. To enable capturing LBR records, the following expression must hold with architectural perfmon version 4 or higher:

$$-(\text{IA32\_DEBUGCTL.LBR} \& (!\text{IA32\_PERF\_GLOBAL\_STATUS.LBR\_FRZ})) = 1$$

- IA32\_PERF\_GLOBAL\_STATUS.CTR\_FRZ[bit 59]: This bit is set due to the following conditions:
  - IA32\_DEBUGCTL.FREEZE\_PERFMON\_ON\_PMI has been set by the profiling agent, and
  - A performance counter, configured to generate PMI, has overflowed to signal a PMI. Consequently, all the performance counters are frozen.

Effectively, the IA32\_PERF\_GLOBAL\_STATUS.CTR\_FRZ bit also serve as an read-only control to enable programmable performance counters and fixed counters in the core PMU. To enable counting with the performance counters, the following expression must hold with architectural perfmon version 4 or higher:

- $(\text{IA32\_PERFEVTSELn.EN} \ \& \ \text{IA32\_PERF\_GLOBAL\_CTRL.PMCn} \ \& \ (!\text{IA32\_PERF\_GLOBAL\_STATUS.CTR\_FRZ})) = 1$  for programmable counter 'n', or
- $(\text{IA32\_PERF\_FIXED\_CTRL.ENi} \ \& \ \text{IA32\_PERF\_GLOBAL\_CTRL.FCi} \ \& \ (!\text{IA32\_PERF\_GLOBAL\_STATUS.CTR\_FRZ})) = 1$  for fixed counter 'i'

The read-only enable interface IA32\_PERF\_GLOBAL\_STATUS.CTR\_FRZ provides a more efficient flow for a PMI handler to use IA32\_DEBUGCTL.Freeza\_Perfmon\_On\_PMI to filter out data that may distort target workload analysis, see Table 17-3. It should be noted the IA32\_PERF\_GLOBAL\_CTRL register continue to serve as the primary interface to control all performance counters of the logical processor.

For example, when the Freeze-On-PMI mode is not being used, a PMI handler would be setting IA32\_PERF\_GLOBAL\_CTRL as the very last step to commence the overall operation after configuring the individual counter registers, controls and PEBS facility. This does not only assure atomic monitoring but also avoids unnecessary complications (e.g. race conditions) when software attempts to change the core PMU configuration while some counters are kept enabled.

Additionally, IA32\_PERF\_GLOBAL\_STATUS.TraceToPAPMI[bit 55]: On processors that support Intel Processor Trace and configured to store trace output packets to physical memory using the ToPA scheme, bit 55 is set when a PMI occurred due to a ToPA entry memory buffer was completely filled.

IA32\_PERF\_GLOBAL\_STATUS also provides an indicator to distinguish interaction of performance monitoring operations with other side-band activities, which apply Intel SGX on processors that support SGX (For additional information about Intel SGX, see “Intel® Software Guard Extensions Programming Reference”).:

- IA32\_PERF\_GLOBAL\_STATUS.ASCI[bit 60]: This bit is set when data accumulated in any of the configured performance counters (i.e. IA32\_PMCx or IA32\_FIXED\_CTRx) may include contributions from direct or indirect operation of Intel SGX to protect an enclave (since the last time IA32\_PERF\_GLOBAL\_STATUS.ASCI was cleared).

Figure 18-10. IA32\_PERF\_GLOBAL\_STATUS MSR and Architectural Perfmon Version 4

Note, a processor’s support for IA32\_PERF\_GLOBAL\_STATUS.TraceToPAPMI[bit 55] is enumerated as a result of CPUID enumerated capability of Intel Processor Trace and the use of the ToPA buffer scheme. Support of IA32\_PERF\_GLOBAL\_STATUS.ASCI[bit 60] is enumerated by the CPUID enumeration of Intel SGX.

### 18.2.4.2 IA32\_PERF\_GLOBAL\_STATUS\_RESET and IA32\_PERF\_GLOBAL\_STATUS\_SET MSRS

With architectural performance monitoring version 3 and lower, clearing of the set bits in IA32\_PERF\_GLOBAL\_STATUS MSR by software is done via IA32\_PERF\_GLOBAL\_OVF\_CTRL MSR. Starting with architectural performance monitoring version 4, software can manage the overflow and other indicators in IA32\_PERF\_GLOBAL\_STATUS using separate interfaces to set or clear individual bits.

The address and the architecturally-defined bits of IA32\_PERF\_GLOBAL\_OVF\_CTRL is inherited by IA32\_PERF\_GLOBAL\_STATUS\_RESET (see Figure 18-11). Further, IA32\_PERF\_GLOBAL\_STATUS\_RESET provides additional bit fields to clear the new indicators in IA32\_PERF\_GLOBAL\_STATUS described in Section 18.2.4.1.

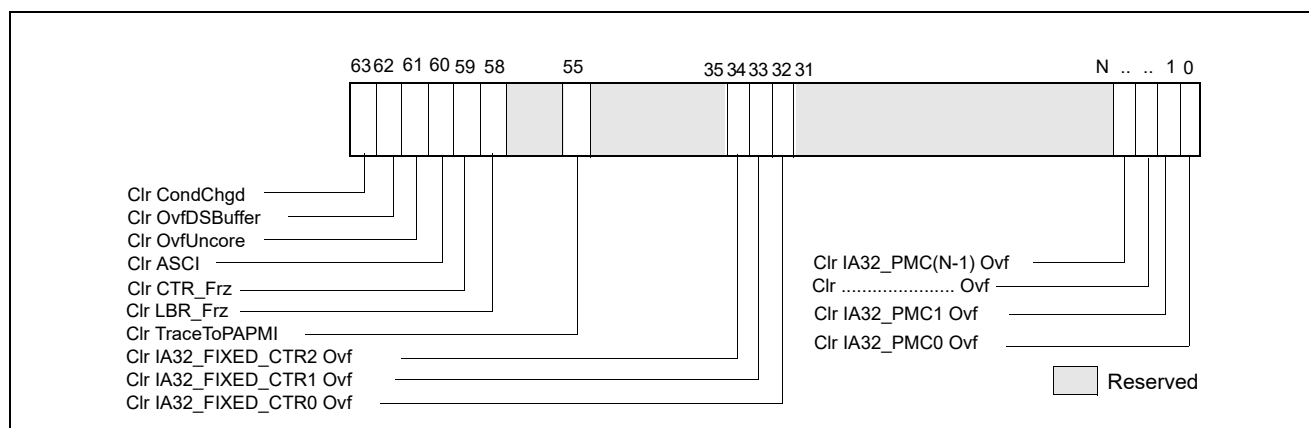

Figure 18-11. IA32\_PERF\_GLOBAL\_STATUS\_RESET MSR and Architectural Perfmon Version 4

The IA32\_PERF\_GLOBAL\_STATUS\_SET MSR is introduced with architectural performance monitoring version 4. It allows software to set individual bits in IA32\_PERF\_GLOBAL\_STATUS. The IA32\_PERF\_GLOBAL\_STATUS\_SET interface can be used by a VMM to virtualize the state of IA32\_PERF\_GLOBAL\_STATUS across VMs.

Figure 18-12. IA32\_PERF\_GLOBAL\_STATUS\_SET MSR and Architectural Perfmon Version 4

### 18.2.4.3 IA32\_PERF\_GLOBAL\_INUSE MSR

In a contemporary software environment, multiple privileged service agents may wish to employ the processor's performance monitoring facilities. The IA32\_MISC\_ENABLE.PERFMON\_AVAILABLE[bit 7] interface could not serve

the need of multiple agent adequately. A white paper, “Performance Monitoring Unit Sharing Guideline”<sup>1</sup>, proposed a cooperative sharing protocol that is voluntary for participating software agents.

Architectural performance monitoring version 4 introduces a new MSR, IA32\_PERF\_GLOBAL\_INUSE, that simplifies the task of multiple cooperating agents to implement the sharing protocol.

The layout of IA32\_PERF\_GLOBAL\_INUSE is shown in Figure 18-13.

**Figure 18-13. IA32\_PERF\_GLOBAL\_INUSE MSR and Architectural Perfmon Version 4**

The IA32\_PERF\_GLOBAL\_INUSE MSR provides an “InUse” bit for each programmable performance counter and fixed counter in the processor. Additionally, it includes an indicator if the PMI mechanism has been configured by a profiling agent.

- IA32\_PERF\_GLOBAL\_INUSE.PERFEVTSEL0\_InUse[bit 0]: This bit reflects the logical state of (IA32\_PERFEVTSEL0[7:0] != 0).
- IA32\_PERF\_GLOBAL\_INUSE.PERFEVTSEL1\_InUse[bit 1]: This bit reflects the logical state of (IA32\_PERFEVTSEL1[7:0] != 0).
- IA32\_PERF\_GLOBAL\_INUSE.PERFEVTSEL2\_InUse[bit 2]: This bit reflects the logical state of (IA32\_PERFEVTSEL2[7:0] != 0).
- IA32\_PERF\_GLOBAL\_INUSE.PERFEVTSELn\_InUse[bit n]: This bit reflects the logical state of (IA32\_PERFEVTSELn[7:0] != 0), n < CPUID.0AH:EAX[15:8].
- IA32\_PERF\_GLOBAL\_INUSE.FC0\_InUse[bit 32]: This bit reflects the logical state of (IA32\_FIXED\_CTR\_CTRL[1:0] != 0).
- IA32\_PERF\_GLOBAL\_INUSE.FC1\_InUse[bit 33]: This bit reflects the logical state of (IA32\_FIXED\_CTR\_CTRL[5:4] != 0).
- IA32\_PERF\_GLOBAL\_INUSE.FC2\_InUse[bit 34]: This bit reflects the logical state of (IA32\_FIXED\_CTR\_CTRL[9:8] != 0).
- IA32\_PERF\_GLOBAL\_INUSE.PMI\_InUse[bit 63]: This bit is set if any one of the following bit is set:
  - IA32\_PERFEVTSELn.INT[bit 20], n < CPUID.0AH:EAX[15:8].
  - IA32\_FIXED\_CTR\_CTRL.ENi\_PMI, i = 0, 1, 2.
  - Any IA32\_PEBS\_ENABLES bit which enables PEBS for a general-purpose or fixed-function performance counter.

## 18.2.5 Full-Width Writes to Performance Counter Registers

The general-purpose performance counter registers IA32\_PMCx are writable via WRMSR instruction. However, the value written into IA32\_PMCx by WRMSR is the signed extended 64-bit value of the EAX[31:0] input of WRMSR.

A processor that supports full-width writes to the general-purpose performance counters enumerated by CPUID.0AH:EAX[15:8] will set IA32\_PERF\_CAPABILITIES[13] to enumerate its full-width-write capability. See Figure 18-63.

If IA32\_PERF\_CAPABILITIES.FW\_WRITE[bit 13] = 1, each IA32\_PMCi is accompanied by a corresponding alias address starting at 4C1H for IA32\_A\_PMC0.

The bit width of the performance monitoring counters is specified in CPUID.0AH:EAX[23:16].

If IA32\_A\_PMCi is present, the 64-bit input value (EDX:EAX) of WRMSR to IA32\_A\_PMCi will cause IA32\_PMCi to be updated by:

```
COUNTERWIDTH = CPUID.0AH:EAX[23:16] bit width of the performance monitoring counter
IA32_PMCi[COUNTERWIDTH-1:32] ← EDX[COUNTERWIDTH-33:0];
IA32_PMCi[31:0] ← EAX[31:0];
EDX[63:COUNTERWIDTH] are reserved
```

## 18.3 PERFORMANCE MONITORING (INTEL® CORE™ PROCESSORS AND INTEL® XEON® PROCESSORS)

### 18.3.1 Performance Monitoring for Processors Based on Intel® Microarchitecture Code Name Nehalem

Intel Core i7 processor family<sup>2</sup> supports architectural performance monitoring capability with version ID 3 (see Section 18.2.3) and a host of non-architectural monitoring capabilities. The Intel Core i7 processor family is based on Intel® microarchitecture code name Nehalem, and provides four general-purpose performance counters (IA32\_PMC0, IA32\_PMC1, IA32\_PMC2, IA32\_PMC3) and three fixed-function performance counters (IA32\_FIXED\_CTR0, IA32\_FIXED\_CTR1, IA32\_FIXED\_CTR2) in the processor core.

Non-architectural performance monitoring in Intel Core i7 processor family uses the IA32\_PERFVTSELx MSR to configure a set of non-architecture performance monitoring events to be counted by the corresponding general-purpose performance counter. The list of non-architectural performance monitoring events is listed in Table 19-29. Non-architectural performance monitoring events fall into two broad categories:

- Performance monitoring events in the processor core: These include many events that are similar to performance monitoring events available to processor based on Intel Core microarchitecture. Additionally, there are several enhancements in the performance monitoring capability for detecting microarchitectural conditions in the processor core or in the interaction of the processor core to the off-core sub-systems in the physical processor package. The off-core sub-systems in the physical processor package is loosely referred to as “uncore”.
- Performance monitoring events in the uncore: The uncore sub-system is shared by more than one processor cores in the physical processor package. It provides additional performance monitoring facility outside of IA32\_PMCx and performance monitoring events that are specific to the uncore sub-system.

Architectural and non-architectural performance monitoring events in Intel Core i7 processor family support thread qualification using bit 21 of IA32\_PERFVTSELx MSR.

The bit fields within each IA32\_PERFVTSELx MSR are defined in Figure 18-6 and described in Section 18.2.1.1 and Section 18.2.3.

2. Intel Xeon processor 5500 series and 3400 series are also based on Intel microarchitecture code name Nehalem; the performance monitoring facilities described in this section generally also apply.

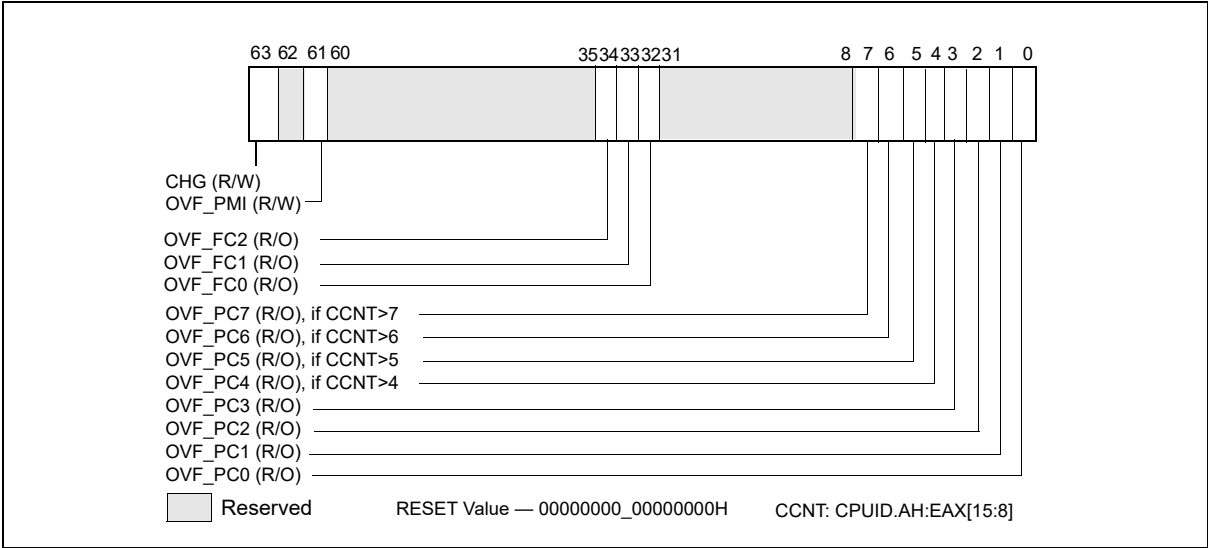

Figure 18-14. IA32\_PERF\_GLOBAL\_STATUS MSR

### 18.3.1.1 Enhancements of Performance Monitoring in the Processor Core

The notable enhancements in the monitoring of performance events in the processor core include:

- Four general purpose performance counters, IA32\_PMCx, associated counter configuration MSRs, IA32\_PERFEVTSELx, and global counter control MSR supporting simplified control of four counters. Each of the four performance counter can support processor event based sampling (PEBS) and thread-qualification of architectural and non-architectural performance events. Width of IA32\_PMCx supported by hardware has been increased. The width of counter reported by CPUID.0AH:EAX[23:16] is 48 bits. The PEBS facility in Intel micro-architecture code name Nehalem has been enhanced to include new data format to capture additional information, such as load latency.
- Load latency sampling facility. Average latency of memory load operation can be sampled using load-latency facility in processors based on Intel microarchitecture code name Nehalem. This field measures the load latency from load's first dispatch of till final data writeback from the memory subsystem. The latency is reported for retired demand load operations and in core cycles (it accounts for re-dispatches). This facility is used in conjunction with the PEBS facility.
- Off-core response counting facility. This facility in the processor core allows software to count certain transaction responses between the processor core to sub-systems outside the processor core (uncore). Counting off-core response requires additional event qualification configuration facility in conjunction with IA32\_PERFEVTSELx. Two off-core response MSRs are provided to use in conjunction with specific event codes that must be specified with IA32\_PERFEVTSELx.

#### 18.3.1.1.1 Processor Event Based Sampling (PEBS)

All four general-purpose performance counters, IA32\_PMCx, can be used for PEBS if the performance event supports PEBS. Software uses IA32\_MISC\_ENABLE[7] and IA32\_MISC\_ENABLE[12] to detect whether the performance monitoring facility and PEBS functionality are supported in the processor. The MSR IA32\_PEBS\_ENABLE provides 4 bits that software must use to enable which IA32\_PMCx overflow condition will cause the PEBS record to be captured.

Additionally, the PEBS record is expanded to allow latency information to be captured. The MSR IA32\_PEBS\_ENABLE provides 4 additional bits that software must use to enable latency data recording in the PEBS record upon the respective IA32\_PMCx overflow condition. The layout of IA32\_PEBS\_ENABLE for processors based on Intel microarchitecture code name Nehalem is shown in Figure 18-15.

When a counter is enabled to capture machine state ( $\text{PEBS\_EN\_PMC}_x = 1$ ), the processor will write machine state information to a memory buffer specified by software as detailed below. When the counter  $\text{IA32\_PMC}_x$  overflows from maximum count to zero, the PEBS hardware is armed.

**Figure 18-15. Layout of IA32\_PEBS\_ENABLE MSR**

Upon occurrence of the next PEBS event, the PEBS hardware triggers an assist and causes a PEBS record to be written. The format of the PEBS record is indicated by the bit field  $\text{IA32\_PERF\_CAPABILITIES}[11:8]$  (see Figure 18-63).

The behavior of PEBS assists is reported by  $\text{IA32\_PERF\_CAPABILITIES}[6]$  (see Figure 18-63). The return instruction pointer (RIP) reported in the PEBS record will point to the instruction after (+1) the instruction that causes the PEBS assist. The machine state reported in the PEBS record is the machine state after the instruction that causes the PEBS assist is retired. For instance, if the instructions:

```
mov eax, [eax] ; causes PEBS assist
```

```
nop
```

are executed, the PEBS record will report the address of the nop, and the value of EAX in the PEBS record will show the value read from memory, not the target address of the read operation.

The PEBS record format is shown in Table 18-3, and each field in the PEBS record is 64 bits long. The PEBS record format, along with debug/store area storage format, does not change regardless of IA-32e mode is active or not.  $\text{CPUID.01H:ECX.DTES64}[\text{bit } 2]$  reports whether the processor's DS storage format support is mode-independent. When set, it uses 64-bit DS storage format.

**Table 18-3. PEBS Record Format for Intel Core i7 Processor Family**

| Byte Offset | Field    | Byte Offset | Field                   |
|-------------|----------|-------------|-------------------------|
| 00H         | R/EFLAGS | 58H         | R9                      |
| 08H         | R/EIP    | 60H         | R10                     |
| 10H         | R/EAX    | 68H         | R11                     |
| 18H         | R/EBX    | 70H         | R12                     |
| 20H         | R/ECX    | 78H         | R13                     |
| 28H         | R/EDX    | 80H         | R14                     |
| 30H         | R/ESI    | 88H         | R15                     |
| 38H         | R/EDI    | 90H         | IA32_PERF_GLOBAL_STATUS |
| 40H         | R/EBP    | 98H         | Data Linear Address     |
| 48H         | R/ESP    | A0H         | Data Source Encoding    |

**Table 18-3. PEBS Record Format for Intel Core i7 Processor Family**

| Byte Offset | Field | Byte Offset | Field                       |
|-------------|-------|-------------|-----------------------------|
| 50H         | R8    | A8H         | Latency value (core cycles) |

In IA-32e mode, the full 64-bit value is written to the register. If the processor is not operating in IA-32e mode, 32-bit value is written to registers with bits 63:32 zeroed. Registers not defined when the processor is not in IA-32e mode are written to zero.

Bytes AFH:90H are enhancement to the PEBS record format. Support for this enhanced PEBS record format is indicated by IA32\_PERF\_CAPABILITIES[11:8] encoding of 0001B.

The value written to bytes 97H:90H is the state of the IA32\_PERF\_GLOBAL\_STATUS register before the PEBS assist occurred. This value is written so software can determine which counters overflowed when this PEBS record was written. Note that this field indicates the overflow status for all counters, regardless of whether they were programmed for PEBS or not.

**Programming PEBS Facility**

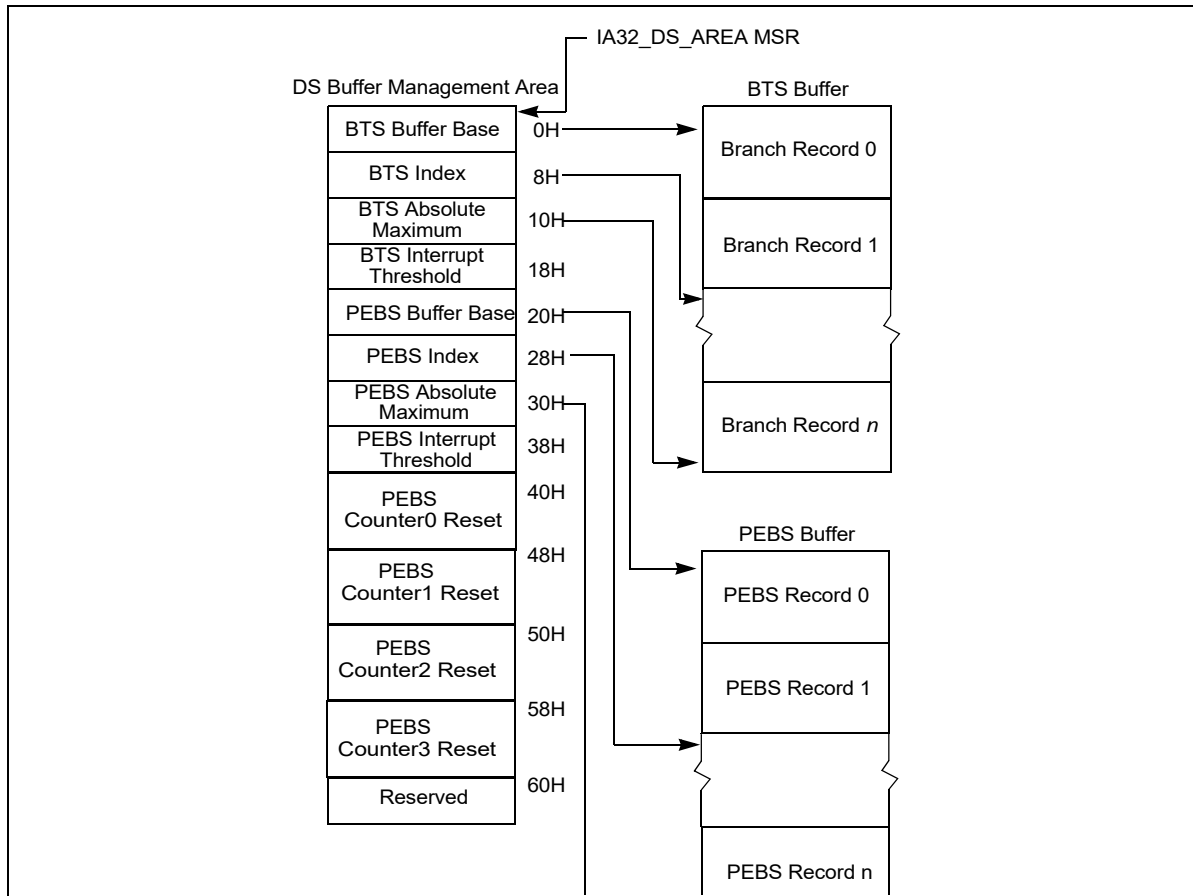

Only a subset of non-architectural performance events in the processor support PEBS. The subset of precise events are listed in Table 18-68. In addition to using IA32\_PERFEVTSELx to specify event unit/mask settings and setting the EN\_PMCx bit in the IA32\_PEBS\_ENABLE register for the respective counter, the software must also initialize the DS\_BUFFER\_MANAGEMENT\_AREA data structure in memory to support capturing PEBS records for precise events.

**NOTE**

PEBS events are only valid when the following fields of IA32\_PERFEVTSELx are all zero: AnyThread, Edge, Invert, CMask.

The beginning linear address of the DS\_BUFFER\_MANAGEMENT\_AREA data structure must be programmed into the IA32\_DS\_AREA register. The layout of the DS\_BUFFER\_MANAGEMENT\_AREA is shown in Figure 18-16.

- **PEBS Buffer Base:** This field is programmed with the linear address of the first byte of the PEBS buffer allocated by software. The processor reads this field to determine the base address of the PEBS buffer. Software should allocate this memory from the non-paged pool.
- **PEBS Index:** This field is initially programmed with the same value as the PEBS Buffer Base field, or the beginning linear address of the PEBS buffer. The processor reads this field to determine the location of the next PEBS record to write to. After a PEBS record has been written, the processor also updates this field with the address of the next PEBS record to be written. The figure above illustrates the state of PEBS Index after the first PEBS record is written.
- **PEBS Absolute Maximum:** This field represents the absolute address of the maximum length of the allocated PEBS buffer plus the starting address of the PEBS buffer. The processor will not write any PEBS record beyond the end of PEBS buffer, when PEBS Index equals PEBS Absolute Maximum. No signaling is generated when PEBS buffer is full. Software must reset the PEBS Index field to the beginning of the PEBS buffer address to continue capturing PEBS records.

**Figure 18-16. PEBS Programming Environment**

- PEBS Interrupt Threshold:** This field specifies the threshold value to trigger a performance interrupt and notify software that the PEBS buffer is nearly full. This field is programmed with the linear address of the first byte of the PEBS record within the PEBS buffer that represents the threshold record. After the processor writes a PEBS record and updates **PEBS Index**, if the **PEBS Index** reaches the threshold value of this field, the processor will generate a performance interrupt. This is the same interrupt that is generated by a performance counter overflow, as programmed in the Performance Monitoring Counters vector in the Local Vector Table of the Local APIC. When a performance interrupt due to PEBS buffer full is generated, the `IA32_PERF_GLOBAL_STATUS.PEBS_Ovf` bit will be set.
- PEBS CounterX Reset:** This field allows software to set up PEBS counter overflow condition to occur at a rate useful for profiling workload, thereby generating multiple PEBS records to facilitate characterizing the profile the execution of test code. After each PEBS record is written, the processor checks each counter to see if it overflowed and was enabled for PEBS (the corresponding bit in `IA32_PEBS_ENABLED` was set). If these conditions are met, then the reset value for each overflowed counter is loaded from the DS Buffer Management Area. For example, if counter `IA32_PMC0` caused a PEBS record to be written, then the value of "PEBS Counter 0 Reset" would be written to counter `IA32_PMC0`. If a counter is not enabled for PEBS, its value will not be modified by the PEBS assist.

#### Performance Counter Prioritization

Performance monitoring interrupts are triggered by a counter transitioning from maximum count to zero (assuming `IA32_PerfEvtSelX.INT` is set). This same transition will cause PEBS hardware to arm, but not trigger. PEBS hardware triggers upon detection of the first PEBS event after the PEBS hardware has been armed (a 0 to 1 transition of the counter). At this point, a PEBS assist will be undertaken by the processor.

Performance counters (fixed and general-purpose) are prioritized in index order. That is, counter IA32\_PMC0 takes precedence over all other counters. Counter IA32\_PMC1 takes precedence over counters IA32\_PMC2 and IA32\_PMC3, and so on. This means that if simultaneous overflows or PEBS assists occur, the appropriate action will be taken for the highest priority performance counter. For example, if IA32\_PMC1 cause an overflow interrupt and IA32\_PMC2 causes an PEBS assist simultaneously, then the overflow interrupt will be serviced first.

The PEBS threshold interrupt is triggered by the PEBS assist, and is by definition prioritized lower than the PEBS assist. Hardware will not generate separate interrupts for each counter that simultaneously overflows. General-purpose performance counters are prioritized over fixed counters.

If a counter is programmed with a precise (PEBS-enabled) event and programmed to generate a counter overflow interrupt, the PEBS assist is serviced before the counter overflow interrupt is serviced. If in addition the PEBS interrupt threshold is met, the

threshold interrupt is generated after the PEBS assist completes, followed by the counter overflow interrupt (two separate interrupts are generated).

Uncore counters may be programmed to interrupt one or more processor cores (see Section 18.3.1.2). It is possible for interrupts posted from the uncore facility to occur coincident with counter overflow interrupts from the processor core. Software must check core and uncore status registers to determine the exact origin of counter overflow interrupts.

#### 18.3.1.1.2 Load Latency Performance Monitoring Facility

The load latency facility provides software a means to characterize the average load latency to different levels of cache/memory hierarchy. This facility requires processor supporting enhanced PEBS record format in the PEBS buffer, see Table 18-3. This field measures the load latency from load's first dispatch of till final data writeback from the memory subsystem. The latency is reported for retired demand load operations and in core cycles (it accounts for re-dispatches).

To use this feature software must assure:

- One of the IA32\_PERFEVTSELx MSR is programmed to specify the event unit MEM\_INST\_RETIRED, and the LATENCY\_ABOVE\_THRESHOLD event mask must be specified (IA32\_PerfEvtSelX[15:0] = 100H). The corresponding counter IA32\_PMCx will accumulate event counts for architecturally visible loads which exceed the programmed latency threshold specified separately in a MSR. Stores are ignored when this event is programmed. The CMASK or INV fields of the IA32\_PerfEvtSelX register used for counting load latency must be 0. Writing other values will result in undefined behavior.
- The MSR\_PEBs\_LD\_LAT\_THRESHOLD MSR is programmed with the desired latency threshold in core clock cycles. Loads with latencies greater than this value are eligible for counting and latency data reporting. The minimum value that may be programmed in this register is 3 (the minimum detectable load latency is 4 core clock cycles).
- The PEBS enable bit in the IA32\_PEBs\_ENABLE register is set for the corresponding IA32\_PMCx counter register. This means that both the PEBs\_EN\_CTRX and LL\_EN\_CTRX bits must be set for the counter(s) of interest. For example, to enable load latency on counter IA32\_PMC0, the IA32\_PEBs\_ENABLE register must be programmed with the 64-bit value 00000001\_00000001H.

When the load-latency facility is enabled, load operations are randomly selected by hardware and tagged to carry information related to data source locality and latency. Latency and data source information of tagged loads are updated internally.

When a PEBS assist occurs, the last update of latency and data source information are captured by the assist and written as part of the PEBS record. The PEBS sample after value (SAV), specified in PEBS CounterX Reset, operates orthogonally to the tagging mechanism. Loads are randomly tagged to collect latency data. The SAV controls the number of tagged loads with latency information that will be written into the PEBS record field by the PEBS assists. The load latency data written to the PEBS record will be for the last tagged load operation which retired just before the PEBS assist was invoked.

The load-latency information written into a PEBS record (see Table 18-3, bytes AFH:98H) consists of:

- **Data Linear Address:** This is the linear address of the target of the load operation.
- **Latency Value:** This is the elapsed cycles of the tagged load operation between dispatch to GO, measured in processor core clock domain.

- **Data Source:** The encoded value indicates the origin of the data obtained by the load instruction. The encoding is shown in Table 18-4. In the descriptions local memory refers to system memory physically attached to a processor package, and remote memory referrals to system memory physically attached to another processor package.

**Table 18-4. Data Source Encoding for Load Latency Record**

| Encoding         | Description   |
|------------------|---|
| 00H              | Unknown L3 cache miss   |
| 01H              | Minimal latency core cache hit. This request was satisfied by the L1 data cache.  |
| 02H              | Pending core cache HIT. Outstanding core cache miss to same cache-line address was already underway.  |
| 03H              | This data request was satisfied by the L2.  |
| 04H              | L3 HIT. Local or Remote home requests that hit L3 cache in the uncore with no coherency actions required (snooping).  |
| 05H              | L3 HIT. Local or Remote home requests that hit the L3 cache and was serviced by another processor core with a cross core snoop where no modified copies were found. (clean).                      |
| 06H              | L3 HIT. Local or Remote home requests that hit the L3 cache and was serviced by another processor core with a cross core snoop where modified copies were found. (HITM).                          |
| 07H <sup>1</sup> | Reserved/LLC Snoop HitM. Local or Remote home requests that hit the last level cache and was serviced by another core with a cross core snoop where modified copies found                         |
| 08H              | L3 MISS. Local homed requests that missed the L3 cache and was serviced by forwarded data following a cross package snoop where no modified copies found. (Remote home requests are not counted). |
| 09H              | Reserved  |
| 0AH              | L3 MISS. Local home requests that missed the L3 cache and was serviced by local DRAM (go to shared state).  |
| 0BH              | L3 MISS. Remote home requests that missed the L3 cache and was serviced by remote DRAM (go to shared state).  |
| 0CH              | L3 MISS. Local home requests that missed the L3 cache and was serviced by local DRAM (go to exclusive state).   |
| 0DH              | L3 MISS. Remote home requests that missed the L3 cache and was serviced by remote DRAM (go to exclusive state).   |
| 0EH              | I/O, Request of input/output operation  |
| 0FH              | The request was to un-cacheable memory.   |

**NOTES:**

1. Bit 7 is supported only for processor with CPUID DisplayFamily\_DisplayModel signature of 06\_2A, and 06\_2E; otherwise it is reserved.

The layout of MSR\_PEBS\_LD\_LAT\_THRESHOLD is shown in Figure 18-17.

**Figure 18-17. Layout of MSR\_PEBS\_LD\_LAT MSR**

Bits 15:0 specifies the threshold load latency in core clock cycles. Performance events with latencies greater than this value are counted in IA32\_PMCx and their latency information is reported in the PEBS record. Otherwise, they are ignored. The minimum value that may be programmed in this field is 3.

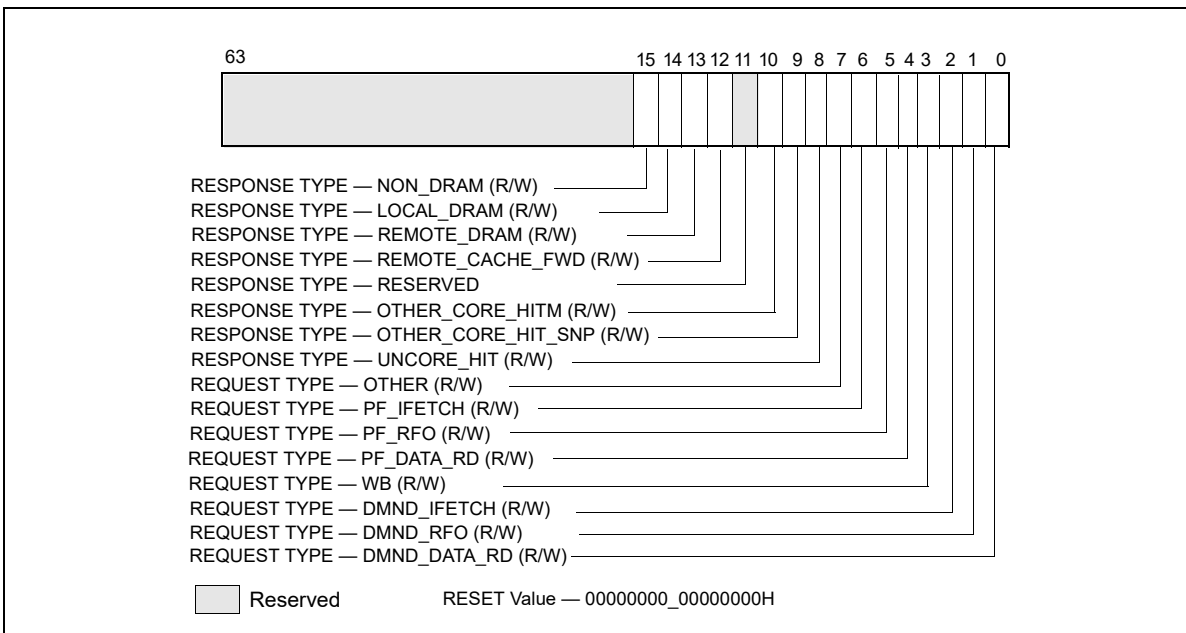

### 18.3.1.1.3 Off-core Response Performance Monitoring in the Processor Core

Programming a performance event using the off-core response facility can choose any of the four IA32\_PERFEVTSELx MSR with specific event codes and predefine mask bit value. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR\_OFFCORE\_RSP\_0. There is only one off-core response configuration MSR. Table 18-5 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32\_PMCx.

**Table 18-5. Off-Core Response Event Encoding**

| Event code in IA32_PERFEVTSELx | Mask Value in IA32_PERFEVTSELx | Required Off-core Response MSR   |
|--------------------------------|--------------------------------|----------------------------------|
| B7H                            | 01H                            | MSR_OFFCORE_RSP_0 (address 1A6H) |

The layout of MSR\_OFFCORE\_RSP\_0 is shown in Figure 18-18. Bits 7:0 specifies the request type of a transaction request to the uncore. Bits 15:8 specifies the response of the uncore subsystem.

**Figure 18-18. Layout of MSR\_OFFCORE\_RSP\_0 and MSR\_OFFCORE\_RSP\_1 to Configure Off-core Response Events**

**Table 18-6. MSR\_OFFCORE\_RSP\_0 and MSR\_OFFCORE\_RSP\_1 Bit Field Definition**

| Bit Name     | Offset | Description   |
|--------------|--------|---|
| DMND_DATA_RD | 0      | (R/W). Counts the number of demand and DCU prefetch data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count L2 data read prefetches or instruction fetches. |
| DMND_RFO     | 1      | (R/W). Counts the number of demand and DCU prefetch reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO.   |
| DMND_IFETCH  | 2      | (R/W). Counts the number of demand and DCU prefetch instruction cacheline reads. Does not count L2 code read prefetches.  |
| WB           | 3      | (R/W). Counts the number of writeback (modified to exclusive) transactions.   |
| PF_DATA_RD   | 4      | (R/W). Counts the number of data cacheline reads generated by L2 prefetchers.   |
| PF_RFO       | 5      | (R/W). Counts the number of RFO requests generated by L2 prefetchers.   |

**Table 18-6. MSR\_OFFCORE\_RSP\_0 and MSR\_OFFCORE\_RSP\_1 Bit Field Definition (Contd.)**

| Bit Name           | Offset | Description   |
|--------------------|--------|---|
| PF_IFETCH          | 6      | (R/W). Counts the number of code reads generated by L2 prefetchers.   |
| OTHER              | 7      | (R/W). Counts one of the following transaction types, including L3 invalidate, I/O, full or partial writes, WC or non-temporal stores, CLFLUSH, Fences, lock, unlock, split lock.                       |
| UNCORE_HIT         | 8      | (R/W). L3 Hit: local or remote home requests that hit L3 cache in the uncore with no coherency actions required (snooping).   |
| OTHER_CORE_HIT_SNP | 9      | (R/W). L3 Hit: local or remote home requests that hit L3 cache in the uncore and was serviced by another core with a cross core snoop where no modified copies were found (clean).                      |
| OTHER_CORE_HIT_TM  | 10     | (R/W). L3 Hit: local or remote home requests that hit L3 cache in the uncore and was serviced by another core with a cross core snoop where modified copies were found (HITM).                          |
| Reserved           | 11     | Reserved  |
| REMOTE_CACHE_FWD   | 12     | (R/W). L3 Miss: local homed requests that missed the L3 cache and was serviced by forwarded data following a cross package snoop where no modified copies found. (Remote home requests are not counted) |
| REMOTE_DRAM        | 13     | (R/W). L3 Miss: remote home requests that missed the L3 cache and were serviced by remote DRAM.   |
| LOCAL_DRAM         | 14     | (R/W). L3 Miss: local home requests that missed the L3 cache and were serviced by local DRAM.   |
| NON_DRAM           | 15     | (R/W). Non-DRAM requests that were serviced by IOH.   |

### 18.3.1.2 Performance Monitoring Facility in the Uncore

The “uncore” in Intel microarchitecture code name Nehalem refers to subsystems in the physical processor package that are shared by multiple processor cores. Some of the sub-systems in the uncore include the L3 cache, Intel QuickPath Interconnect link logic, and integrated memory controller. The performance monitoring facilities inside the uncore operates in the same clock domain as the uncore (U-clock domain), which is usually different from the processor core clock domain. The uncore performance monitoring facilities described in this section apply to Intel Xeon processor 5500 series and processors with the following CPUID signatures: 06\_1AH, 06\_1EH, 06\_1FH (see Chapter 2, “Model-Specific Registers (MSRs)” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4*). An overview of the uncore performance monitoring facilities is described separately.

The performance monitoring facilities available in the U-clock domain consist of:

- Eight General-purpose counters (MSR\_UNCORE\_PerfCntr0 through MSR\_UNCORE\_PerfCntr7). The counters are 48 bits wide. Each counter is associated with a configuration MSR, MSR\_UNCORE\_PerfEvtSelx, to specify event code, event mask and other event qualification fields. A set of global uncore performance counter enabling/overflow/status control MSRs are also provided for software.
- Performance monitoring in the uncore provides an address/opcode match MSR that provides event qualification control based on address value or QPI command opcode.
- One fixed-function counter, MSR\_UNCORE\_FixedCntr0. The fixed-function uncore counter increments at the rate of the U-clock when enabled.

The frequency of the uncore clock domain can be determined from the uncore clock ratio which is available in the PCI configuration space register at offset C0H under device number 0 and Function 0.

#### 18.3.1.2.1 Uncore Performance Monitoring Management Facility

MSR\_UNCORE\_PERF\_GLOBAL\_CTRL provides bit fields to enable/disable general-purpose and fixed-function counters in the uncore. Figure 18-19 shows the layout of MSR\_UNCORE\_PERF\_GLOBAL\_CTRL for an uncore that is shared by four processor cores in a physical package.

- EN\_PCn (bit n, n = 0, 7): When set, enables counting for the general-purpose uncore counter MSR\_UNCORE\_PerfCntr n.
- EN\_FC0 (bit 32): When set, enables counting for the fixed-function uncore counter MSR\_UNCORE\_FixedCntr0.

- EN\_PMI\_COREn (bit n, n = 0, 3 if four cores are present): When set, processor core n is programmed to receive an interrupt signal from any interrupt enabled uncore counter. PMI delivery due to an uncore counter overflow is enabled by setting IA32\_DEBUGCTL.Offcore\_PMI\_EN to 1.
- PMI\_FRZ (bit 63): When set, all U-clock uncore counters are disabled when any one of them signals a performance interrupt. Software must explicitly re-enable the counter by setting the enable bits in MSR\_UNCORE\_PERF\_GLOBAL\_CTRL upon exit from the ISR.

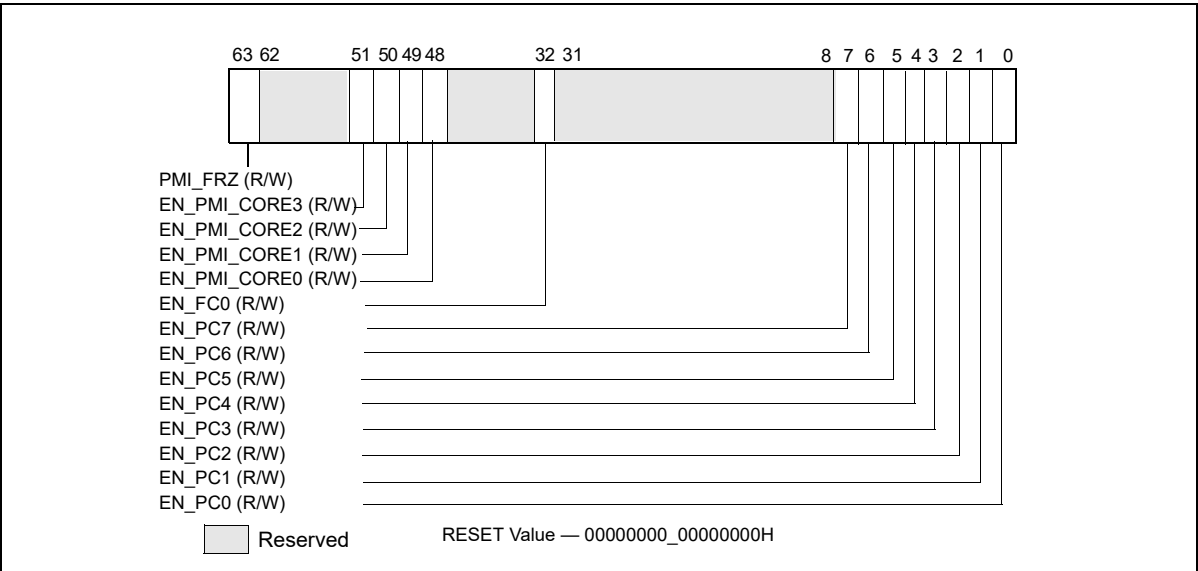

Figure 18-19. Layout of MSR\_UNCORE\_PERF\_GLOBAL\_CTRL MSR

MSR\_UNCORE\_PERF\_GLOBAL\_STATUS provides overflow status of the U-clock performance counters in the uncore. This is a read-only register. If an overflow status bit is set the corresponding counter has overflowed. The register provides a condition change bit (bit 63) which can be quickly checked by software to determine if a significant change has occurred since the last time the condition change status was cleared. Figure 18-20 shows the layout of MSR\_UNCORE\_PERF\_GLOBAL\_STATUS.

- OVF\_PCn (bit n, n = 0, 7): When set, indicates general-purpose uncore counter MSR\_UNCORE\_PerfCntr n has overflowed.
- OVF\_FC0 (bit 32): When set, indicates the fixed-function uncore counter MSR\_UNCORE\_FixedCntr0 has overflowed.
- OVF\_PMI (bit 61): When set indicates that an uncore counter overflowed and generated an interrupt request.
- CHG (bit 63): When set indicates that at least one status bit in MSR\_UNCORE\_PERF\_GLOBAL\_STATUS register has changed state.

MSR\_UNCORE\_PERF\_GLOBAL\_OVF\_CTRL allows software to clear the status bits in the UNCORE\_PERF\_GLOBAL\_STATUS register. This is a write-only register, and individual status bits in the global status register are cleared by writing a binary one to the corresponding bit in this register. Writing zero to any bit position in this register has no effect on the uncore PMU hardware.

**Figure 18-20. Layout of MSR\_UNCORE\_PERF\_GLOBAL\_STATUS MSR**

Figure 18-21 shows the layout of MSR\_UNCORE\_PERF\_GLOBAL\_OVF\_CTRL.

**Figure 18-21. Layout of MSR\_UNCORE\_PERF\_GLOBAL\_OVF\_CTRL MSR**

- CLR\_OVF\_PCn (bit n, n = 0, 7): Set this bit to clear the overflow status for general-purpose uncore counter MSR\_UNCORE\_PerfCntr n. Writing a value other than 1 is ignored.
- CLR\_OVF\_FC0 (bit 32): Set this bit to clear the overflow status for the fixed-function uncore counter MSR\_UNCORE\_FixedCntr0. Writing a value other than 1 is ignored.
- CLR\_OVF\_PMI (bit 61): Set this bit to clear the OVF\_PMI flag in MSR\_UNCORE\_PERF\_GLOBAL\_STATUS. Writing a value other than 1 is ignored.
- CLR\_CHG (bit 63): Set this bit to clear the CHG flag in MSR\_UNCORE\_PERF\_GLOBAL\_STATUS register. Writing a value other than 1 is ignored.

### 18.3.1.2.2 Uncore Performance Event Configuration Facility

MSR\_UNCORE\_PerfEvtSel0 through MSR\_UNCORE\_PerfEvtSel7 are used to select performance event and configure the counting behavior of the respective uncore performance counter. Each uncore PerfEvtSel MSR is paired with an uncore performance counter. Each uncore counter must be locally configured using the corresponding MSR\_UNCORE\_PerfEvtSelx and counting must be enabled using the respective EN\_PCx bit in MSR\_UNCORE\_PERF\_GLOBAL\_CTRL. Figure 18-22 shows the layout of MSR\_UNCORE\_PERFEVTSELx.

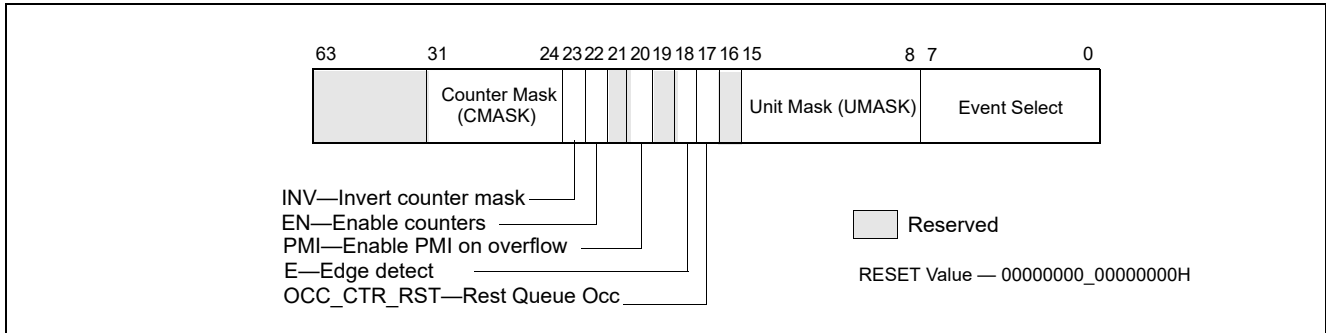

Figure 18-22. Layout of MSR\_UNCORE\_PERFEVTSELx MSRs

- Event Select (bits 7:0): Selects the event logic unit used to detect uncore events.
- Unit Mask (bits 15:8) : Condition qualifiers for the event selection logic specified in the Event Select field.
- OCC\_CTR\_RST (bit 17): When set causes the queue occupancy counter associated with this event to be cleared (zeroed). Writing a zero to this bit will be ignored. It will always read as a zero.
- Edge Detect (bit 18): When set causes the counter to increment when a deasserted to asserted transition occurs for the conditions that can be expressed by any of the fields in this register.
- PMI (bit 20): When set, the uncore will generate an interrupt request when this counter overflowed. This request will be routed to the logical processors as enabled in the PMI enable bits (EN\_PMI\_COREx) in the register MSR\_UNCORE\_PERF\_GLOBAL\_CTRL.
- EN (bit 22): When clear, this counter is locally disabled. When set, this counter is locally enabled and counting starts when the corresponding EN\_PCx bit in MSR\_UNCORE\_PERF\_GLOBAL\_CTRL is set.
- INV (bit 23): When clear, the Counter Mask field is interpreted as greater than or equal to. When set, the Counter Mask field is interpreted as less than.
- Counter Mask (bits 31:24): When this field is clear, it has no effect on counting. When set to a value other than zero, the logical processor compares this field to the event counts on each core clock cycle. If INV is clear and the event counts are greater than or equal to this field, the counter is incremented by one. If INV is set and the event counts are less than this field, the counter is incremented by one. Otherwise the counter is not incremented.

Figure 18-23 shows the layout of MSR\_UNCORE\_FIXED\_CTR\_CTRL.

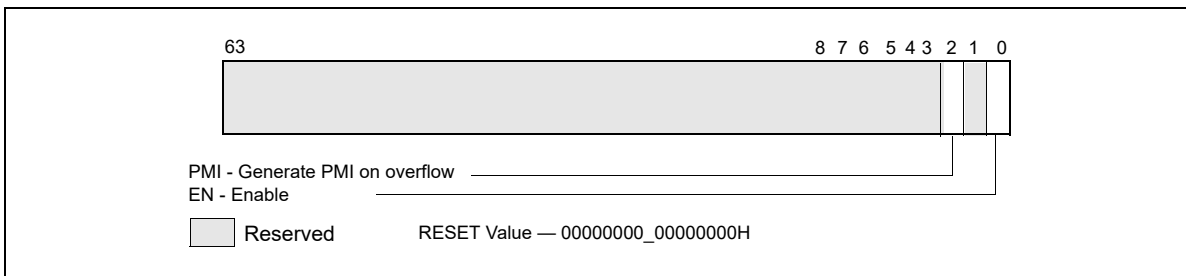

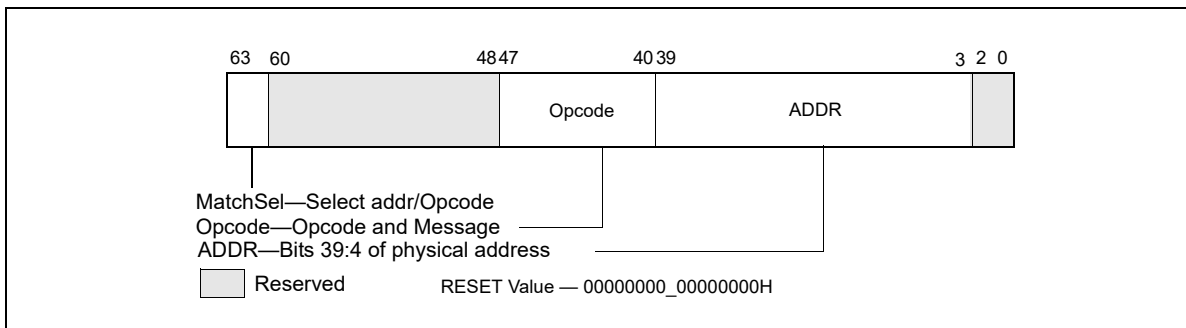

Figure 18-23. Layout of MSR\_UNCORE\_FIXED\_CTR\_CTRL MSR

- EN (bit 0): When clear, the uncore fixed-function counter is locally disabled. When set, it is locally enabled and counting starts when the EN\_FC0 bit in MSR\_UNCORE\_PERF\_GLOBAL\_CTRL is set.
- PMI (bit 2): When set, the uncore will generate an interrupt request when the uncore fixed-function counter overflowed. This request will be routed to the logical processors as enabled in the PMI enable bits (EN\_PMI\_COREx) in the register MSR\_UNCORE\_PERF\_GLOBAL\_CTRL.

Both the general-purpose counters (MSR\_UNCORE\_PerfCnt) and the fixed-function counter (MSR\_UNCORE\_FixedCnt0) are 48 bits wide. They support both counting and interrupt based sampling usages. The event logic unit can filter event counts to specific regions of code or transaction types incoming to the home node logic.

### 18.3.1.2.3 Uncore Address/Opcode Match MSR

The Event Select field [7:0] of MSR\_UNCORE\_PERFEVTSELx is used to select different uncore event logic unit. When the event "ADDR\_OPCODE\_MATCH" is selected in the Event Select field, software can filter uncore performance events according to transaction address and certain transaction responses. The address filter and transaction response filtering requires the use of MSR\_UNCORE\_ADDR\_OPCODE\_MATCH register. The layout is shown in Figure 18-24.

**Figure 18-24. Layout of MSR\_UNCORE\_ADDR\_OPCODE\_MATCH MSR**

- Addr (bits 39:3): The physical address to match if "MatchSel" field is set to select address match. The uncore performance counter will increment if the lowest 40-bit incoming physical address (excluding bits 2:0) for a transaction request matches bits 39:3.
- Opcode (bits 47:40) : Bits 47:40 allow software to filter uncore transactions based on QPI link message class/packed header opcode. These bits are consists two sub-fields:
  - Bits 43:40 specify the QPI packet header opcode.
  - Bits 47:44 specify the QPI message classes.

Table 18-7 lists the encodings supported in the opcode field.

**Table 18-7. Opcode Field Encoding for MSR\_UNCORE\_ADDR\_OPCODE\_MATCH**

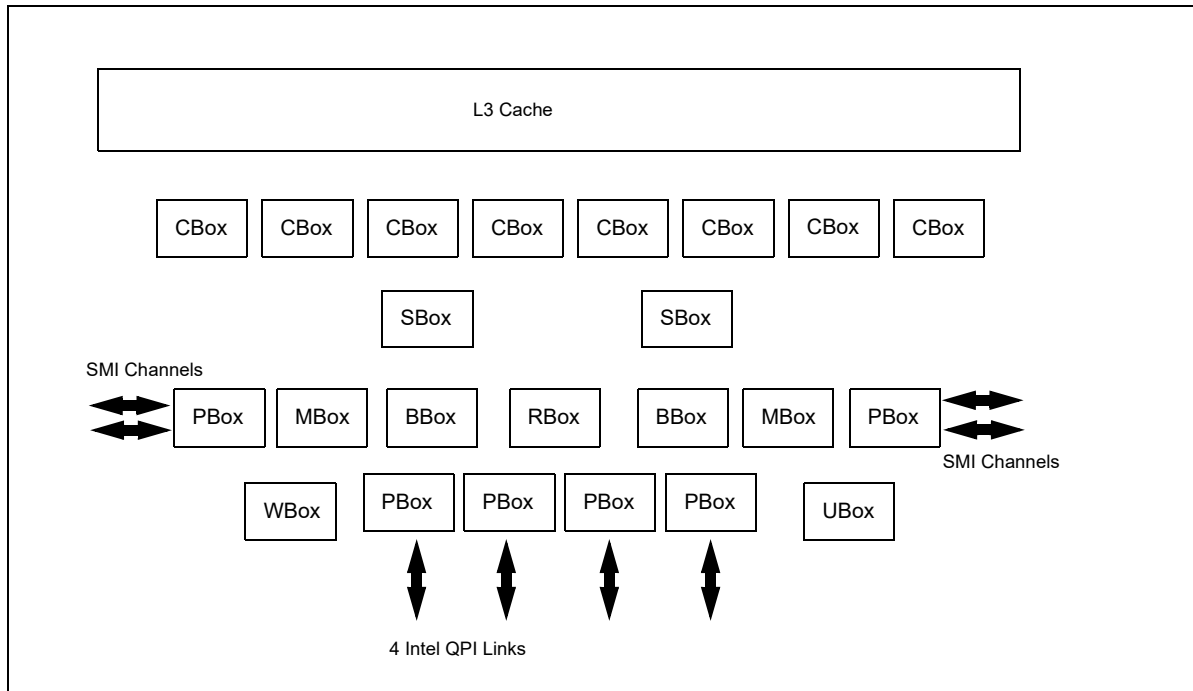

| Opcode [43:40] | QPI Message Class               |                                   |                                  |
|----------------|---------------------------------|-----------------------------------|----------------------------------|
|                | Home Request<br>[47:44] = 0000B | Snoop Response<br>[47:44] = 0001B | Data Response<br>[47:44] = 1110B |
|                |                                 | 1                                 |                                  |
| DMND_IFETCH    | 2                               | 2                                 |                                  |
| WB             | 3                               | 3                                 |                                  |
| PF_DATA_RD     | 4                               | 4                                 |                                  |
| PF_RFO         | 5                               | 5                                 |                                  |
| PF_IFETCH      | 6                               | 6                                 |                                  |
| OTHER          | 7                               | 7                                 |                                  |
| NON_DRAM       | 15                              | 15                                |                                  |

- MatchSel (bits 63:61): Software specifies the match criteria according to the following encoding:
  - 000B: Disable addr\_opcode match hardware.
  - 100B: Count if only the address field matches.
  - 010B: Count if only the opcode field matches.
  - 110B: Count if either opcode field matches or the address field matches.
  - 001B: Count only if both opcode and address field match.
  - Other encoding are reserved.

### 18.3.1.3 Intel® Xeon® Processor 7500 Series Performance Monitoring Facility

The performance monitoring facility in the processor core of Intel® Xeon® processor 7500 series are the same as those supported in Intel Xeon processor 5500 series. The uncore subsystem in Intel Xeon processor 7500 series are significantly different. The uncore performance monitoring facility consist of many distributed units associated with individual logic control units (referred to as boxes) within the uncore subsystem. A high level block diagram of the various box units of the uncore is shown in Figure 18-25.

Uncore PMUs are programmed via MSR interfaces. Each of the distributed uncore PMU units have several general-purpose counters. Each counter requires an associated event select MSR, and may require additional MSRs to configure sub-event conditions. The uncore PMU MSRs associated with each box can be categorized based on its functional scope: per-counter, per-box, or global across the uncore. The number counters available in each box type are different. Each box generally provides a set of MSRs to enable/disable, check status/overflow of multiple counters within each box.

**Figure 18-25. Distributed Units of the Uncore of Intel® Xeon® Processor 7500 Series**

Table 18-8 summarizes the number MSRs for uncore PMU for each box.

**Table 18-8. Uncore PMU MSR Summary**

| Box   | # of Boxes | Counters per Box         | Counter Width | General Purpose | Global Enable | Sub-control MSRs |
|-------|------------|--------------------------|---------------|-----------------|---------------|------------------|
| C-Box | 8          | 6                        | 48            | Yes             | per-box       | None             |
| S-Box | 2          | 4                        | 48            | Yes             | per-box       | Match/Mask       |
| B-Box | 2          | 4                        | 48            | Yes             | per-box       | Match/Mask       |
| M-Box | 2          | 6                        | 48            | Yes             | per-box       | Yes              |
| R-Box | 1          | 16 ( 2 port, 8 per port) | 48            | Yes             | per-box       | Yes              |
| W-Box | 1          | 4                        | 48            | Yes             | per-box       | None             |
|       |            | 1                        | 48            | No              | per-box       | None             |
| U-Box | 1          | 1                        | 48            | Yes             | uncore        | None             |

The W-Box provides 4 general-purpose counters, each requiring an event select configuration MSR, similar to the general-purpose counters in other boxes. There is also a fixed-function counter that increments clockticks in the uncore clock domain.

For C,S,B,M,R, and W boxes, each box provides an MSR to enable/disable counting, configuring PMI of multiple counters within the same box, this is somewhat similar the “global control” programming interface, IA32\_PERF\_GLOBAL\_CTRL, offered in the core PMU. Similarly status information and counter overflow control for multiple counters within the same box are also provided in C,S,B,M,R, and W boxes.

In the U-Box, MSR\_U\_PMON\_GLOBAL\_CTL provides overall uncore PMU enable/disable and PMI configuration control. The scope of status information in the U-box is at per-box granularity, in contrast to the per-box status information MSR (in the C,S,B,M,R, and W boxes) providing status information of individual counter overflow. The difference in scope also apply to the overflow control MSR in the U-Box versus those in the other Boxes.

The individual MSRs that provide uncore PMU interfaces are listed in Chapter 2, “Model-Specific Registers (MSRs)” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4*, Table 2-16 under the general naming style of MSR\_%box#%\_PMON\_%scope\_function%, where %box#% designates the type of box and zero-based index if there are more than one box of the same type, %scope\_function% follows the examples below:

- Multi-counter enabling MSRs: MSR\_U\_PMON\_GLOBAL\_CTL, MSR\_S0\_PMON\_BOX\_CTL, MSR\_C7\_PMON\_BOX\_CTL, etc.
- Multi-counter status MSRs: MSR\_U\_PMON\_GLOBAL\_STATUS, MSR\_S0\_PMON\_BOX\_STATUS, MSR\_C7\_PMON\_BOX\_STATUS, etc.
- Multi-counter overflow control MSRs: MSR\_U\_PMON\_GLOBAL\_OVF\_CTL, MSR\_S0\_PMON\_BOX\_OVF\_CTL, MSR\_C7\_PMON\_BOX\_OVF\_CTL, etc.
- Performance counters MSRs: the scope is implicitly per counter, e.g. MSR\_U\_PMON\_CTR, MSR\_S0\_PMON\_CTR0, MSR\_C7\_PMON\_CTR5, etc.
- Event select MSRs: the scope is implicitly per counter, e.g. MSR\_U\_PMON\_EVNT\_SEL, MSR\_S0\_PMON\_EVNT\_SEL0, MSR\_C7\_PMON\_EVNT\_SEL5, etc.
- Sub-control MSRs: the scope is implicitly per-box granularity, e.g. MSR\_M0\_PMON\_TIMESTAMP, MSR\_R0\_PMON\_IPERF0\_P1, MSR\_S1\_PMON\_MATCH.

Details of uncore PMU MSR bit field definitions can be found in a separate document “Intel Xeon Processor 7500 Series Uncore Performance Monitoring Guide”.

### 18.3.2 Performance Monitoring for Processors Based on Intel® Microarchitecture Code Name Westmere

All of the performance monitoring programming interfaces (architectural and non-architectural core PMU facilities, and uncore PMU) described in Section 18.6.3 also apply to processors based on Intel® microarchitecture code name Westmere.

Table 18-5 describes a non-architectural performance monitoring event (event code 0B7H) and associated MSR\_OFFCORE\_RSP\_0 (address 1A6H) in the core PMU. This event and a second functionally equivalent offcore response event using event code 0BBH and MSR\_OFFCORE\_RSP\_1 (address 1A7H) are supported in processors based on Intel microarchitecture code name Westmere. The event code and event mask definitions of Non-architectural performance monitoring events are listed in Table 19-29.

The load latency facility is the same as described in Section 18.3.1.1.2, but added enhancement to provide more information in the data source encoding field of each load latency record. The additional information relates to STLB\_MISS and LOCK, see Table 18-13.

### 18.3.3 Intel® Xeon® Processor E7 Family Performance Monitoring Facility

The performance monitoring facility in the processor core of the Intel® Xeon® processor E7 family is the same as those supported in the Intel Xeon processor 5600 series<sup>3</sup>. The uncore subsystem in the Intel Xeon processor E7 family is similar to those of the Intel Xeon processor 7500 series. The high level construction of the uncore subsystem is similar to that shown in Figure 18-25, with the additional capability that up to 10 C-Box units are supported.

---

3. Exceptions are indicated for event code 0FH in Table 19-21; and valid bits of data source encoding field of each load latency record is limited to bits 5:4 of Table 18-13.

Table 18-9 summarizes the number MSRs for uncore PMU for each box.

**Table 18-9. Uncore PMU MSR Summary for Intel® Xeon® Processor E7 Family**

| Box   | # of Boxes | Counters per Box         | Counter Width | General Purpose | Global Enable | Sub-control MSRs |
|-------|------------|--------------------------|---------------|-----------------|---------------|------------------|
| C-Box | 10         | 6                        | 48            | Yes             | per-box       | None             |
| S-Box | 2          | 4                        | 48            | Yes             | per-box       | Match/Mask       |
| B-Box | 2          | 4                        | 48            | Yes             | per-box       | Match/Mask       |
| M-Box | 2          | 6                        | 48            | Yes             | per-box       | Yes              |
| R-Box | 1          | 16 ( 2 port, 8 per port) | 48            | Yes             | per-box       | Yes              |
| W-Box | 1          | 4                        | 48            | Yes             | per-box       | None             |
|       |            | 1                        | 48            | No              | per-box       | None             |
| U-Box | 1          | 1                        | 48            | Yes             | uncore        | None             |

Details of the uncore performance monitoring facility of Intel Xeon Processor E7 family is available in the “Intel® Xeon® Processor E7 Uncore Performance Monitoring Programming Reference Manual”.

### 18.3.4 Performance Monitoring for Processors Based on Intel® Microarchitecture Code Name Sandy Bridge

Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx processor series, and Intel® Xeon® processor E3-1200 family are based on Intel microarchitecture code name Sandy Bridge; this section describes the performance monitoring facilities provided in the processor core. The core PMU supports architectural performance monitoring capability with version ID 3 (see Section 18.2.3) and a host of non-architectural monitoring capabilities.

Architectural performance monitoring version 3 capabilities are described in Section 18.2.3.

The core PMU’s capability is similar to those described in Section 18.3.1.1 and Section 18.6.3, with some differences and enhancements relative to Intel microarchitecture code name Westmere summarized in Table 18-10.

**Table 18-10. Core PMU Comparison**

| Box  | Intel® microarchitecture code name Sandy Bridge  | Intel® microarchitecture code name Westmere  | Comment                                  |
|--|--|--|--|
| # of Fixed counters per thread               | 3  | 3  | Use CPUID to enumerate # of counters.    |
| # of general-purpose counters per core       | 8  | 8  |  |
| Counter width (R,W)                          | R:48, W: 32/48   | R:48, W:32   | See Section 18.2.2.                      |
| # of programmable counters per thread        | 4 or (8 if a core not shared by two threads)   | 4  | Use CPUID to enumerate # of counters.    |
| PMI Overhead Mitigation                      | <ul style="list-style-type: none"> <li>Freeze_Perfmon_on_PMI with legacy semantics.</li> <li>Freeze_on_LBR with legacy semantics for branch profiling.</li> <li>Freeze_while_SMM.</li> </ul> | <ul style="list-style-type: none"> <li>Freeze_Perfmon_on_PMI with legacy semantics.</li> <li>Freeze_on_LBR with legacy semantics for branch profiling.</li> <li>Freeze_while_SMM.</li> </ul> | See Section 17.4.7.                      |
| Processor Event Based Sampling (PEBS) Events | See Table 18-12.   | See Table 18-68.   | IA32_PMC4-IA32_PMC7 do not support PEBS. |

**Table 18-10. Core PMU Comparison (Contd.)**

| Box                     | Intel® microarchitecture code name Sandy Bridge  | Intel® microarchitecture code name Westmere | Comment                     |
|-------------------------|--|---|-----------------------------|

### 18.3.4.1 Global Counter Control Facilities In Intel® Microarchitecture Code Name Sandy Bridge

The number of general-purpose performance counters visible to a logical processor can vary across Processors based on Intel microarchitecture code name Sandy Bridge. Software must use CPUID to determine the number performance counters/event select registers (See Section 18.2.1.1).

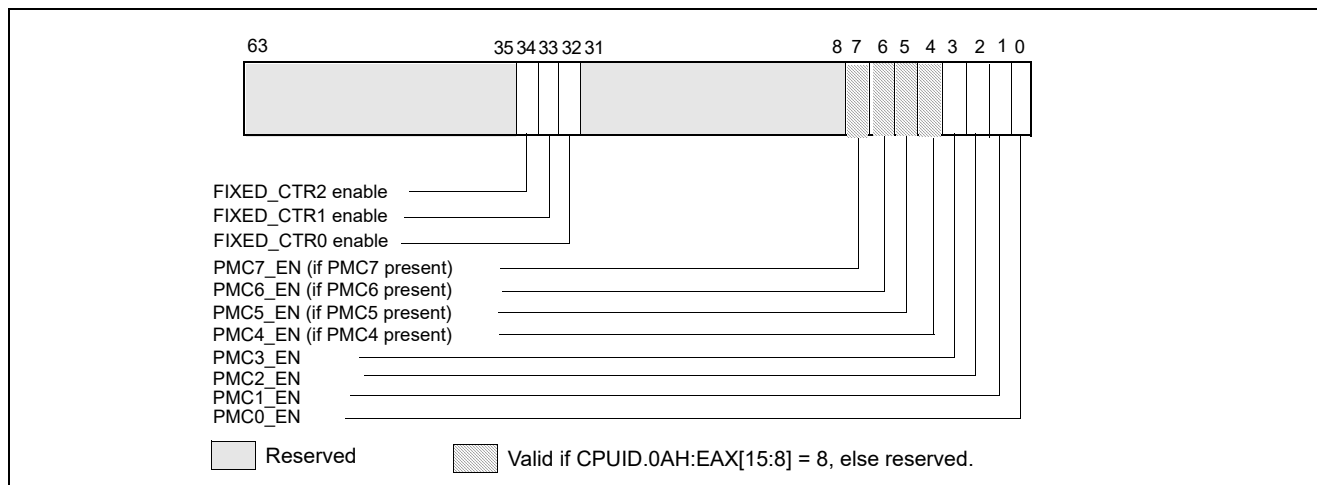

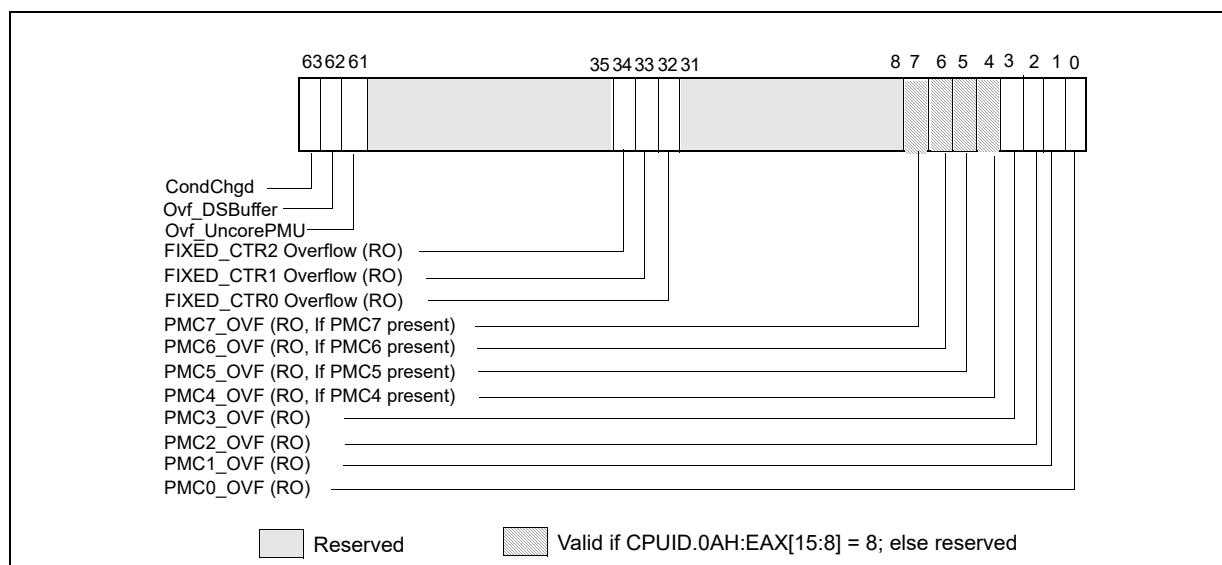

**Figure 18-26. IA32\_PERF\_GLOBAL\_CTRL MSR in Intel® Microarchitecture Code Name Sandy Bridge**

Figure 18-42 depicts the layout of IA32\_PERF\_GLOBAL\_CTRL MSR. The enable bits (PMC4\_EN, PMC5\_EN, PMC6\_EN, PMC7\_EN) corresponding to IA32\_PMC4-IA32\_PMC7 are valid only if CPUID.0AH:EAX[15:8] reports a value of '8'. If CPUID.0AH:EAX[15:8] = 4, attempts to set the invalid bits will cause #GP.

Each enable bit in IA32\_PERF\_GLOBAL\_CTRL is AND'ed with the enable bits for all privilege levels in the respective IA32\_PERFEVTSELx or IA32\_PERF\_FIXED\_CTR\_CTRL MSRs to start/stop the counting of respective counters. Counting is enabled if the AND'ed results is true; counting is disabled when the result is false.

IA32\_PERF\_GLOBAL\_STATUS MSR provides single-bit status used by software to query the overflow condition of each performance counter. IA32\_PERF\_GLOBAL\_STATUS[bit 62] indicates overflow conditions of the DS area data buffer (see Figure 18-27). A value of 1 in each bit of the PMCx\_OVF field indicates an overflow condition has occurred in the associated counter.

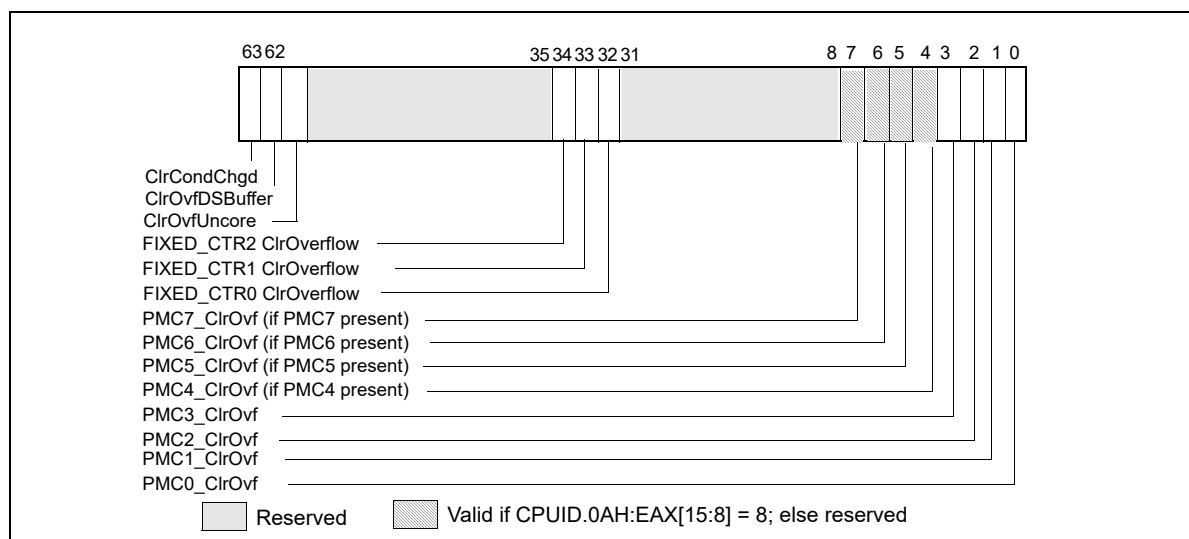

**Figure 18-27. IA32\_PERF\_GLOBAL\_STATUS MSR in Intel® Microarchitecture Code Name Sandy Bridge**

When a performance counter is configured for PEBS, an overflow condition in the counter will arm PEBS. On the subsequent event following overflow, the processor will generate a PEBS event. On a PEBS event, the processor will perform bounds checks based on the parameters defined in the DS Save Area (see Section 17.4.9). Upon successful bounds checks, the processor will store the data record in the defined buffer area, clear the counter overflow status, and reload the counter. If the bounds checks fail, the PEBS will be skipped entirely. In the event that the PEBS buffer fills up, the processor will set the OvfBuffer bit in MSR\_PERF\_GLOBAL\_STATUS.

IA32\_PERF\_GLOBAL\_OVF\_CTL MSR allows software to clear overflow the indicators for general-purpose or fixed-function counters via a single WRMSR (see Figure 18-28). Clear overflow indications when:

- Setting up new values in the event select and/or UMASK field for counting or interrupt based sampling.
- Reloading counter values to continue sampling.
- Disabling event counting or interrupt based sampling.

**Figure 18-28. IA32\_PERF\_GLOBAL\_OVF\_CTL MSR in Intel microarchitecture code name Sandy Bridge**

### 18.3.4.2 Counter Coalescence

In processors based on Intel microarchitecture code name Sandy Bridge, each processor core implements eight general-purpose counters. CPUID.0AH:EAX[15:8] will report either 4 or 8 depending specific processor's product features.

If a processor core is shared by two logical processors, each logical processors can access 4 counters (IA32\_PMC0-IA32\_PMC3). This is the same as in the prior generation for processors based on Intel microarchitecture code name Nehalem.

If a processor core is not shared by two logical processors, all eight general-purpose counters are visible, and CPUID.0AH:EAX[15:8] reports 8. IA32\_PMC4-IA32\_PMC7 occupy MSR addresses 0C5H through 0C8H. Each counter is accompanied by an event select MSR (IA32\_PERFEVTSEL4-IA32\_PERFEVTSEL7).

If CPUID.0AH:EAX[15:8] report 4, access to IA32\_PMC4-IA32\_PMC7, IA32\_PMC4-IA32\_PMC7 will cause #GP. Writing 1's to bit position 7:4 of IA32\_PERF\_GLOBAL\_CTRL, IA32\_PERF\_GLOBAL\_STATUS, or IA32\_PERF\_GLOBAL\_OVF\_CTL will also cause #GP.

### 18.3.4.3 Full Width Writes to Performance Counters

Processors based on Intel microarchitecture code name Sandy Bridge support full-width writes to the general-purpose counters, IA32\_PMCx. Support of full-width writes are enumerated by IA32\_PERF\_CAPABILITIES.FW\_WRITES[13] (see Section 18.2.4).

The default behavior of IA32\_PMCx is unchanged, i.e. WRMSR to IA32\_PMCx results in a sign-extended 32-bit value of the input EAX written into IA32\_PMCx. Full-width writes must issue WRMSR to a dedicated alias MSR address for each IA32\_PMCx.

Software must check the presence of full-width write capability and the presence of the alias address IA32\_A\_PMCx by testing IA32\_PERF\_CAPABILITIES[13].

### 18.3.4.4 PEBS Support in Intel® Microarchitecture Code Name Sandy Bridge

Processors based on Intel microarchitecture code name Sandy Bridge support PEBS, similar to those offered in prior generation, with several enhanced features. The key components and differences of PEBS facility relative to Intel microarchitecture code name Westmere is summarized in Table 18-11.

**Table 18-11. PEBS Facility Comparison**

| Box                       | Intel® microarchitecture code name Sandy Bridge                         | Intel® microarchitecture code name Westmere | Comment                                   |
|---------------------------|---|---|---|
| Valid IA32_PMCx           | PMC0-PMC3   | PMC0-PMC3                                   | No PEBS on PMC4-PMC7.                     |
| PEBS Buffer Programming   | Section 18.3.1.1.1  | Section 18.3.1.1.1                          | Unchanged                                 |
| IA32_PEBS_ENABLE Layout   | Figure 18-29  | Figure 18-15                                |   |
| PEBS record layout        | Physical Layout same as Table 18-3.                                     | Table 18-3                                  | Enhanced fields at offsets 98H, A0H, A8H. |
| PEBS Events               | See Table 18-12.  | See Table 18-68.                            | IA32_PMC4-IA32_PMC7 do not support PEBS.  |
| PEBS-Load Latency         | See Table 18-13.  | Table 18-4                                  |   |
| PEBS-Precise Store        | Yes; see Section 18.3.4.4.3.  | No  | IA32_PMC3 only                            |
| PEBS-PDIR                 | Yes   | No  | IA32_PMC1 only                            |
| PEBS skid from EventingIP | 1 (or 2 if micro+macro fusion)  | 1   |   |
| SAMPLING Restriction      | Small SAV(CountDown) value incur higher overhead than prior generation. |   |   |

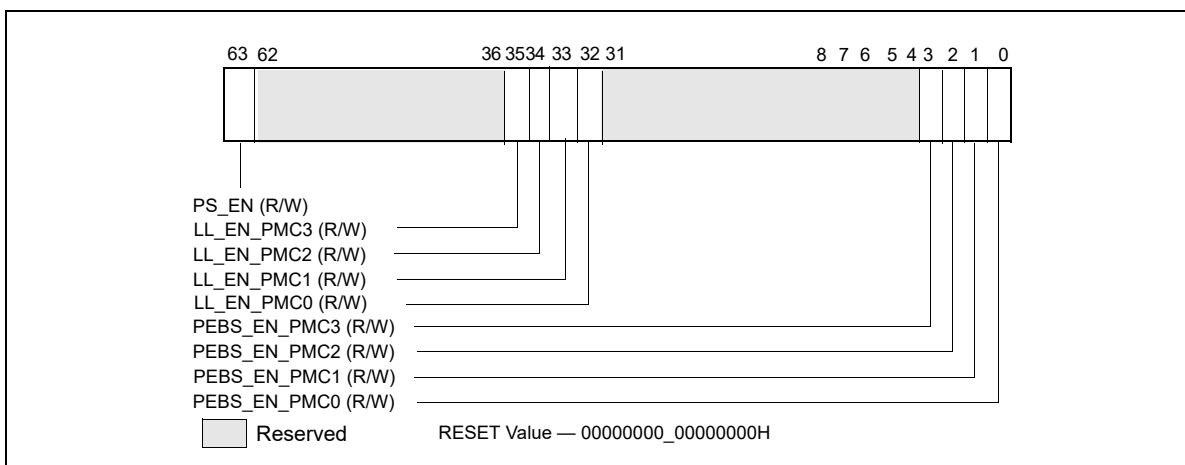

Only IA32\_PMC0 through IA32\_PMC3 support PEBS.

### NOTE

PEBS events are only valid when the following fields of IA32\_PERFEVTSELx are all zero: AnyThread, Edge, Invert, CMask.

In a PMU with PDIR capability, PEBS behavior is unpredictable if IA32\_PERFEVTSELx or IA32\_PMCx is changed for a PEBS-enabled counter while an event is being counted. To avoid this, changes to the programming or value of a PEBS-enabled counter should be performed when the counter is disabled.

In IA32\_PEBS\_ENABLE MSR, bit 63 is defined as PS\_ENABLE: When set, this enables IA32\_PMC3 to capture precise store information. Only IA32\_PMC3 supports the precise store facility. In typical usage of PEBS, the bit fields in IA32\_PEBS\_ENABLE are written to when the agent software starts PEBS operation; the enabled bit fields should be modified only when re-programming another PEBS event or cleared when the agent uses the performance counters for non-PEBS operations.

**Figure 18-29. Layout of IA32\_PEBS\_ENABLE MSR**

#### 18.3.4.4.1 PEBS Record Format

The layout of PEBS records physically identical to those shown in Table 18-3, but the fields at offset 98H, A0H and A8H have been enhanced to support additional PEBS capabilities.

- **Load/Store Data Linear Address (Offset 98H):** This field will contain the linear address of the source of the load, or linear address of the destination of the store.
- **Data Source /Store Status (Offset A0H):** When load latency is enabled, this field will contain three piece of information (including an encoded value indicating the source which satisfied the load operation). The source field encodings are detailed in Table 18-4. When precise store is enabled, this field will contain information indicating the status of the store, as detailed in Table 19.
- **Latency Value/0 (Offset A8H):** When load latency is enabled, this field contains the latency in cycles to service the load. This field is not meaningful when precise store is enabled and will be written to zero in that case. Upon writing the PEBS record, microcode clears the overflow status bits in the IA32\_PERF\_GLOBAL\_STATUS corresponding to those counters that both overflowed and were enabled in the IA32\_PEBS\_ENABLE register. The status bits of other counters remain unaffected.

The number PEBS events has expanded. The list of PEBS events supported in Intel microarchitecture code name Sandy Bridge is shown in Table 18-12.

**Table 18-12. PEBS Performance Events for Intel® Microarchitecture Code Name Sandy Bridge**

| Event Name                    | Event Select | Sub-event        | UMask            |
|-------------------------------|--------------|------------------|------------------|
| INST_RETIRED                  | C0H          | PREC_DIST        | 01H <sup>1</sup> |
| UOPS_RETIRED                  | C2H          | All              | 01H              |
|                               |              | Retire_Slots     | 02H              |
| BR_INST_RETIRED               | C4H          | Conditional      | 01H              |
|                               |              | Near_Call        | 02H              |
|                               |              | All_branches     | 04H              |
|                               |              | Near_Return      | 08H              |
|                               |              | Near_Taken       | 20H              |
| BR_MISP_RETIRED               | C5H          | Conditional      | 01H              |
|                               |              | Near_Call        | 02H              |
|                               |              | All_branches     | 04H              |
|                               |              | Not_Taken        | 10H              |
|                               |              | Taken            | 20H              |
| MEM_UOPS_RETIRED              | D0H          | STLB_MISS_LOADS  | 11H              |
|                               |              | STLB_MISS_STORES | 12H              |
|                               |              | LOCK_LOADS       | 21H              |
|                               |              | SPLIT_LOADS      | 41H              |
|                               |              | SPLIT_STORES     | 42H              |
|                               |              | ALL_LOADS        | 81H              |
|                               |              | ALL_STORES       | 82H              |
| MEM_LOAD_UOPS_RETIRED         | D1H          | L1_Hit           | 01H              |
|                               |              | L2_Hit           | 02H              |
|                               |              | L3_Hit           | 04H              |
|                               |              | Hit_LFB          | 40H              |
| MEM_LOAD_UOPS_LLC_HIT_RETIRED | D2H          | XSNP_Miss        | 01H              |
|                               |              | XSNP_Hit         | 02H              |
|                               |              | XSNP_Hitm        | 04H              |
|                               |              | XSNP_None        | 08H              |

**NOTES:**

1. Only available on IA32\_PMC1.

**18.3.4.4.2 Load Latency Performance Monitoring Facility**

The load latency facility in Intel microarchitecture code name Sandy Bridge is similar to that in prior microarchitecture. It provides software a means to characterize the average load latency to different levels of cache/memory hierarchy. This facility requires processor supporting enhanced PEBS record format in the PEBS buffer, see Table 18-3 and Section 18.3.4.4.1. This field measures the load latency from load's first dispatch of till final data writeback from the memory subsystem. The latency is reported for retired demand load operations and in core cycles (it accounts for re-dispatches).

To use this feature software must assure:

- One of the IA32\_PERFVTSELx MSR is programmed to specify the event unit MEM\_TRANS\_RETIRED, and the LATENCY\_ABOVE\_THRESHOLD event mask must be specified (IA32\_PerfEvtSelX[15:0] = 1CDH). The corresponding counter IA32\_PMCx will accumulate event counts for architecturally visible loads which exceed the programmed latency threshold specified separately in a MSR. Stores are ignored when this event is

programmed. The CMASK or INV fields of the IA32\_PerfEvtSelX register used for counting load latency must be 0. Writing other values will result in undefined behavior.

- The MSR\_PEBS\_LD\_LAT\_THRESHOLD MSR is programmed with the desired latency threshold in core clock cycles. Loads with latencies greater than this value are eligible for counting and latency data reporting. The minimum value that may be programmed in this register is 3 (the minimum detectable load latency is 4 core clock cycles).
- The PEBS enable bit in the IA32\_PEBS\_ENABLE register is set for the corresponding IA32\_PMCx counter register. This means that both the PEBS\_EN\_CTRX and LL\_EN\_CTRX bits must be set for the counter(s) of interest. For example, to enable load latency on counter IA32\_PMC0, the IA32\_PEBS\_ENABLE register must be programmed with the 64-bit value 00000001.00000001H.
- When Load latency event is enabled, no other PEBS event can be configured with other counters.

When the load-latency facility is enabled, load operations are randomly selected by hardware and tagged to carry information related to data source locality and latency. Latency and data source information of tagged loads are updated internally. The MEM\_TRANS\_RETIRE event for load latency counts only tagged retired loads. If a load is cancelled it will not be counted and the internal state of the load latency facility will not be updated. In this case the hardware will tag the next available load.

When a PEBS assist occurs, the last update of latency and data source information are captured by the assist and written as part of the PEBS record. The PEBS sample after value (SAV), specified in PEBS CounterX Reset, operates orthogonally to the tagging mechanism. Loads are randomly tagged to collect latency data. The SAV controls the number of tagged loads with latency information that will be written into the PEBS record field by the PEBS assists. The load latency data written to the PEBS record will be for the last tagged load operation which retired just before the PEBS assist was invoked.

The physical layout of the PEBS records is the same as shown in Table 18-3. The specificity of Data Source entry at offset A0H has been enhanced to report three pieces of information.

**Table 18-13. Layout of Data Source Field of Load Latency Record**

| Field     | Position | Description  |
|-----------|----------|--|
| Source    | 3:0      | See Table 18-4   |
| STLB_MISS | 4        | 0: The load did not miss the STLB (hit the DTLB or STLB).<br>1: The load missed the STLB.          |
| Lock      | 5        | 0: The load was not part of a locked transaction.<br>1: The load was part of a locked transaction. |
| Reserved  | 63:6     | Reserved   |

The layout of MSR\_PEBS\_LD\_LAT\_THRESHOLD is the same as shown in Figure 18-17.

#### 18.3.4.4.3 Precise Store Facility

Processors based on Intel microarchitecture code name Sandy Bridge offer a precise store capability that complements the load latency facility. It provides a means to profile store memory references in the system.

Precise stores leverage the PEBS facility and provide additional information about sampled stores. Having precise memory reference events with linear address information for both loads and stores can help programmers improve data structure layout, eliminate remote node references, and identify cache-line conflicts in NUMA systems.

Only IA32\_PMC3 can be used to capture precise store information. After enabling this facility, counter overflows will initiate the generation of PEBS records as previously described in PEBS. Upon counter overflow hardware captures the linear address and other status information of the next store that retires. This information is then written to the PEBS record.

To enable the precise store facility, software must complete the following steps. Please note that the precise store facility relies on the PEBS facility, so the PEBS configuration requirements must be completed before attempting to capture precise store information.

- Complete the PEBS configuration steps.

- Program the MEM\_TRANS\_RETIREDPRECISE\_STORE event in IA32\_PERFVTSEL3. Only counter 3 (IA32\_PMC3) supports collection of precise store information.
- Set IA32\_PEBS\_ENABLE[3] and IA32\_PEBS\_ENABLE[63]. This enables IA32\_PMC3 as a PEBS counter and enables the precise store facility, respectively.

The precise store information written into a PEBS record affects entries at offset 98H, A0H and A8H of Table 18-3. The specificity of Data Source entry at offset A0H has been enhanced to report three piece of information.

**Table 18-14. Layout of Precise Store Information In PEBS Record**

| Field                        | Offset | Description  |
|------------------------------|--------|--|
| Store Data<br>Linear Address | 98H    | The linear address of the destination of the store.  |
| Store Status                 | A0H    | <b>L1D Hit</b> (Bit 0): The store hit the data cache closest to the core (lowest latency cache) if this bit is set, otherwise the store missed the data cache.<br><b>STLB Miss</b> (bit 4): The store missed the STLB if set, otherwise the store hit the STLB<br><b>Locked Access</b> (bit 5): The store was part of a locked access if set, otherwise the store was not part of a locked access. |
| Reserved                     | A8H    | Reserved   |

#### 18.3.4.4.4 Precise Distribution of Instructions Retired (PDIR)

Upon triggering a PEBS assist, there will be a finite delay between the time the counter overflows and when the microcode starts to carry out its data collection obligations. INST\_RETIREDP is a very common event that is used to sample where performance bottleneck happened and to help identify its location in instruction address space. Even if the delay is constant in core clock space, it invariably manifest as variable “skids” in instruction address space. This creates a challenge for programmers to profile a workload and pinpoint the location of bottlenecks.

The core PMU in processors based on Intel microarchitecture code name Sandy Bridge include a facility referred to as precise distribution of Instruction Retired (PDIR).

The PDIR facility mitigates the “skid” problem by providing an early indication of when the INST\_RETIREDP counter is about to overflow, allowing the machine to more precisely trap on the instruction that actually caused the counter overflow thus eliminating skid.

PDIR applies only to the INST\_RETIREDP.ALL precise event, and must use IA32\_PMC1 with PerfEvtSel1 property configured and bit 1 in the IA32\_PEBS\_ENABLE set to 1. INST\_RETIREDP.ALL is a non-architectural performance event, it is not supported in prior generation microarchitectures. Additionally, on processors with CPUID DisplayFamily\_DisplayModel signatures of 06\_2A and 06\_2D, the tool that programs PDIR should quiesce the rest of the programmable counters in the core when PDIR is active.

#### 18.3.4.5 Off-core Response Performance Monitoring

The core PMU in processors based on Intel microarchitecture code name Sandy Bridge provides off-core response facility similar to prior generation. Off-core response can be programmed only with a specific pair of event select and counter MSR, and with specific event codes and predefine mask bit value in a dedicated MSR to specify attributes of the off-core transaction. Two event codes are dedicated for off-core response event programming. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR\_OFFCORE\_RSP\_x. Table 18-15 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32\_PMCx.

**Table 18-15. Off-Core Response Event Encoding**

| Counter | Event code | UMask | Required Off-core Response MSR   |
|---------|------------|-------|----------------------------------|
| PMCO-3  | B7H        | 01H   | MSR_OFFCORE_RSP_0 (address 1A6H) |
| PMCO-3  | BBH        | 01H   | MSR_OFFCORE_RSP_1 (address 1A7H) |

The layout of MSR\_OFFCORE\_RSP\_0 and MSR\_OFFCORE\_RSP\_1 are shown in Figure 18-30 and Figure 18-31. Bits 15:0 specifies the request type of a transaction request to the uncore. Bits 30:16 specifies supplier information, bits 37:31 specifies snoop response information.

**Figure 18-30. Request\_Type Fields for MSR\_OFFCORE\_RSP\_x****Table 18-16. MSR\_OFFCORE\_RSP\_x Request\_Type Field Definition**

| Bit Name       | Offset | Description  |
|----------------|--------|--|
| DMND_DATA_RD   | 0      | (R/W). Counts the number of demand data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count L2 data read prefetches or instruction fetches. |
| DMND_RFO       | 1      | (R/W). Counts the number of demand and DCU prefetch reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.                                     |
| DMND_IFETCH    | 2      | (R/W). Counts the number of demand and DCU prefetch instruction cacheline reads. Does not count L2 code read prefetches.   |
| WB             | 3      | (R/W). Counts the number of writeback (modified to exclusive) transactions.  |
| PF_DATA_RD     | 4      | (R/W). Counts the number of data cacheline reads generated by L2 prefetchers.  |
| PF_RFO         | 5      | (R/W). Counts the number of RFO requests generated by L2 prefetchers.  |
| PF_IFETCH      | 6      | (R/W). Counts the number of code reads generated by L2 prefetchers.  |
| PF_LLC_DATA_RD | 7      | (R/W). L2 prefetcher to L3 for loads.  |
| PF_LLC_RFO     | 8      | (R/W). RFO requests generated by L2 prefetcher   |
| PF_LLC_IFETCH  | 9      | (R/W). L2 prefetcher to L3 for instruction fetches.  |
| BUS_LOCKS      | 10     | (R/W). Bus lock and split lock requests  |
| STRM_ST        | 11     | (R/W). Streaming store requests  |
| OTHER          | 15     | (R/W). Any other request that crosses IDI, including I/O.  |

Figure 18-31. Response\_Supplier and Snoop Info Fields for MSR\_OFFCORE\_RSP\_x

To properly program this extra register, software must set at least one request type bit and a valid response type pattern. Otherwise, the event count reported will be zero. It is permissible and useful to set multiple request and response type bits in order to obtain various classes of off-core response events. Although MSR\_OFFCORE\_RSP\_x allow an agent software to program numerous combinations that meet the above guideline, not all combinations produce meaningful data.

Table 18-17. MSR\_OFFCORE\_RSP\_x Response Supplier Info Field Definition

| Subtype       | Bit Name | Offset | Description                                    |
|---------------|----------|--------|--|
| Common        | Any      | 16     | (R/W). Catch all value for any response types. |
| Supplier Info | NO_SUPP  | 17     | (R/W). No Supplier Information available       |
|               | LLC_HITM | 18     | (R/W). M-state initial lookup stat in L3.      |
|               | LLC_HITE | 19     | (R/W). E-state                                 |
|               | LLC_HITS | 20     | (R/W). S-state                                 |
|               | LLC_HITF | 21     | (R/W). F-state                                 |
|               | LOCAL    | 22     | (R/W). Local DRAM Controller                   |
|               | Reserved | 30:23  | Reserved                                       |

To specify a complete offcore response filter, software must properly program bits in the request and response type fields. A valid request type must have at least one bit set in the non-reserved bits of 15:0. A valid response type must be a non-zero value of the following expression:

ANY | [(‘OR’ of Supplier Info Bits) & (‘OR’ of Snoop Info Bits)]

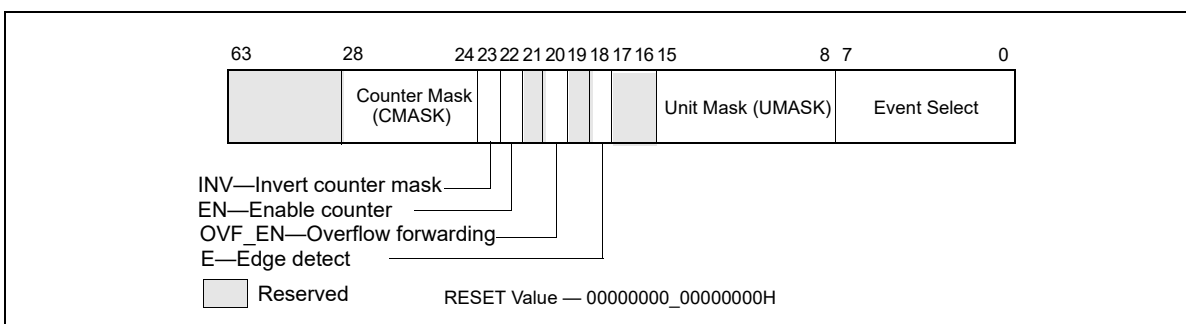

If “ANY” bit is set, the supplier and snoop info bits are ignored.

**Table 18-18. MSR\_OFFCORE\_RSP\_x Snoop Info Field Definition**

| Subtype    | Bit Name       | Offset | Description  |
|------------|----------------|--------|--|
| Snoop Info | SNP_NONE       | 31     | (R/W). No details on snoop-related information   |
|            | SNP_NOT_NEEDED | 32     | (R/W). No snoop was needed to satisfy the request.   |
|            | SNP_MISS       | 33     | (R/W). A snoop was needed and it missed all snooped caches:<br>-For LLC Hit, ReslHitl was returned by all cores<br>-For LLC Miss, Rspl was returned by all sockets and data was returned from DRAM.  |
|            | SNP_NO_FWD     | 34     | (R/W). A snoop was needed and it hits in at least one snooped cache. Hit denotes a cache-line was valid before snoop effect. This includes:<br>-Snoop Hit w/ Invalidation (LLC Hit, RFO)<br>-Snoop Hit, Left Shared (LLC Hit/Miss, IFetch/Data_RD)<br>-Snoop Hit w/ Invalidation and No Forward (LLC Miss, RFO Hit S)<br>In the LLC Miss case, data is returned from DRAM. |
|            | SNP_FWD        | 35     | (R/W). A snoop was needed and data was forwarded from a remote socket. This includes:<br>-Snoop Forward Clean, Left Shared (LLC Hit/Miss, IFetch/Data_RD/RFT).   |
|            | HITM           | 36     | (R/W). A snoop was needed and it HitM-ed in local or remote cache. HitM denotes a cache-line was in modified state before effect as a results of snoop. This includes:<br>-Snoop HitM w/ WB (LLC miss, IFetch/Data_RD)<br>-Snoop Forward Modified w/ Invalidation (LLC Hit/Miss, RFO)<br>-Snoop MtoS (LLC Hit, IFetch/Data_RD).  |
|            | NON_DRAM       | 37     | (R/W). Target was non-DRAM system address. This includes MMIO transactions.  |

#### 18.3.4.6 Uncore Performance Monitoring Facilities In Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series

The uncore sub-system in Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx processor series provides a unified L3 that can support up to four processor cores. The L3 cache consists multiple slices, each slice interface with a processor via a coherence engine, referred to as a C-Box. Each C-Box provides dedicated facility of MSRs to select uncore performance monitoring events and each C-Box event select MSR is paired with a counter register, similar in style as those described in Section 18.3.1.2.2. The ARB unit in the uncore also provides its local performance counters and event select MSRs. The layout of the event select MSRs in the C-Boxes and the ARB unit are shown in Figure 18-32.

**Figure 18-32. Layout of Uncore PERFECTSEL MSR for a C-Box Unit or the ARB Unit**

The bit fields of the uncore event select MSRs for a C-box unit or the ARB unit are summarized below:

- Event\_Select (bits 7:0) and UMASK (bits 15:8): Specifies the microarchitectural condition to count in a local uncore PMU counter, see Table 19-18.
- E (bit 18): Enables edge detection filtering, if 1.
- OVF\_EN (bit 20): Enables the overflow indicator from the uncore counter forwarded to MSR\_UNC\_PERF\_GLOBAL\_CTRL, if 1.
- EN (bit 22): Enables the local counter associated with this event select MSR.
- INV (bit 23): Event count increments with non-negative value if 0, with negated value if 1.
- CMASK (bits 28:24): Specifies a positive threshold value to filter raw event count input.

At the uncore domain level, there is a master set of control MSRs that centrally manages all the performance monitoring facility of uncore units. Figure 18-33 shows the layout of the uncore domain global control.

When an uncore counter overflows, a PMI can be routed to a processor core. Bits 3:0 of MSR\_UNC\_PERF\_GLOBAL\_CTRL can be used to select which processor core to handle the uncore PMI. Software must then write to bit 13 of IA32\_DEBUGCTL (at address 1D9H) to enable this capability.

- PMI\_SEL\_Core#: Enables the forwarding of an uncore PMI request to a processor core, if 1. If bit 30 (WakePMI) is '1', a wake request is sent to the respective processor core prior to sending the PMI.
- EN: Enables the fixed uncore counter, the ARB counters, and the CBO counters in the uncore PMU, if 1. This bit is cleared if bit 31 (FREEZE) is set and any enabled uncore counters overflow.
- WakePMI: Controls sending a wake request to any halted processor core before issuing the uncore PMI request. If a processor core was halted and not sent a wake request, the uncore PMI will not be serviced by the processor core.
- FREEZE: Provides the capability to freeze all uncore counters when an overflow condition occurs in a unit counter. When this bit is set, and a counter overflow occurs, the uncore PMU logic will clear the global enable bit (bit 29).

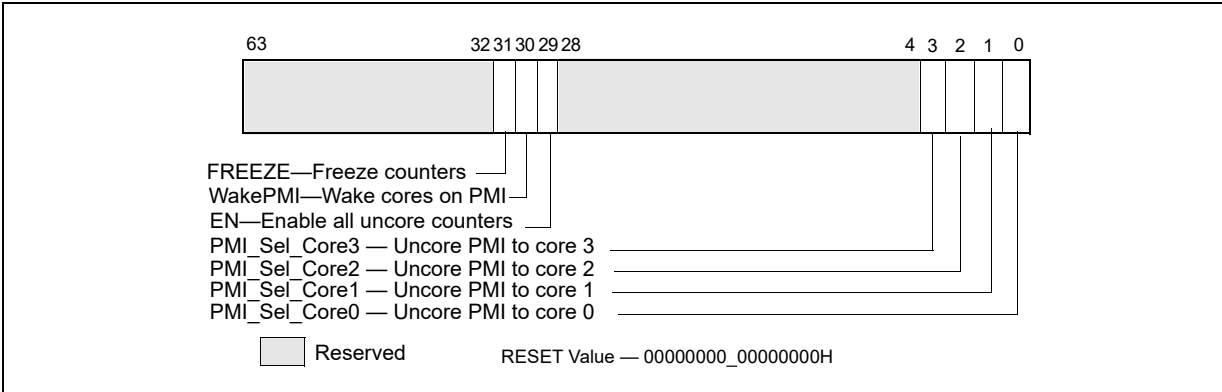

Figure 18-33. Layout of MSR\_UNC\_PERF\_GLOBAL\_CTRL MSR for Uncore

Additionally, there is also a fixed counter, counting uncore clockticks, for the uncore domain. Table 18-19 summarizes the number MSRs for uncore PMU for each box.

**Table 18-19. Uncore PMU MSR Summary**

| Box           | # of Boxes   | Counters per Box | Counter Width | General Purpose | Global Enable | Comment                                       |
|---------------|--------------|------------------|---------------|-----------------|---------------|---|
| C-Box         | SKU specific | 2                | 44            | Yes             | Per-box       | Up to 4, see Table 2-20<br>MSR_UNC_CBO_CONFIG |
| ARB           | 1            | 2                | 44            | Yes             | Uncore        |   |
| Fixed Counter | N.A.         | N.A.             | 48            | No              | Uncore        |   |

#### 18.3.4.6.1 Uncore Performance Monitoring Events

There are certain restrictions on the uncore performance counters in each C-Box. Specifically,

- Occupancy events are supported only with counter 0 but not counter 1.

Other uncore C-Box events can be programmed with either counter 0 or 1.

The C-Box uncore performance events described in Table 19-18 can collect performance characteristics of transactions initiated by processor core. In that respect, they are similar to various sub-events in the OFFCORE\_RESPONSE family of performance events in the core PMU. Information such as data supplier locality (LLC HIT/MISS) and snoop responses can be collected via OFFCORE\_RESPONSE and qualified on a per-thread basis.

On the other hand, uncore performance event logic can not associate its counts with the same level of per-thread qualification attributes as the core PMU events can. Therefore, whenever similar event programming capabilities are available from both core PMU and uncore PMU, the recommendation is that utilizing the core PMU events may be less affected by artifacts, complex interactions and other factors.

#### 18.3.4.7 Intel® Xeon® Processor E5 Family Performance Monitoring Facility

The Intel® Xeon® Processor E5 Family (and Intel® Core™ i7-3930K Processor) are based on Intel microarchitecture code name Sandy Bridge-E. While the processor cores share the same microarchitecture as those of the Intel® Xeon® Processor E3 Family and 2nd generation Intel Core i7-2xxx, Intel Core i5-2xxx, Intel Core i3-2xxx processor series, the uncore subsystems are different. An overview of the uncore performance monitoring facilities of the Intel Xeon processor E5 family (and Intel Core i7-3930K processor) is described in Section 18.3.4.8.

Thus, the performance monitoring facilities in the processor core generally are the same as those described in Section 18.6.3 through Section 18.3.4.5. However, the MSR\_OFFCORE\_RSP\_0/MSR\_OFFCORE\_RSP\_1 Response Supplier Info field shown in Table 18-17 applies to Intel Core Processors with CPUID signature of DisplayFamily\_DisplayModel encoding of 06\_2AH; Intel Xeon processor with CPUID signature of DisplayFamily\_DisplayModel encoding of 06\_2DH supports an additional field for remote DRAM controller shown in Table 18-20. Additionally, there are some small differences in the non-architectural performance monitoring events (see Table 19-16).

**Table 18-20. MSR\_OFFCORE\_RSP\_x Supplier Info Field Definitions**

| Subtype       | Bit Name | Offset | Description   |
|---------------|----------|--------|---|
| Common        | Any      | 16     | (R/W). Catch all value for any response types.          |
| Supplier Info | NO_SUPP  | 17     | (R/W). No Supplier Information available                |
|               | LLC_HITM | 18     | (R/W). M-state initial lookup stat in L3.               |
|               | LLC_HITE | 19     | (R/W). E-state  |
|               | LLC_HITS | 20     | (R/W). S-state  |
|               | LLC_HITF | 21     | (R/W). F-state  |
|               | LOCAL    | 22     | (R/W). Local DRAM Controller                            |
|               | Remote   | 30:23  | (R/W). Remote DRAM Controller (either all 0s or all 1s) |

#### 18.3.4.8 Intel® Xeon® Processor E5 Family Uncore Performance Monitoring Facility

The uncore subsystem in the Intel Xeon processor E5-2600 product family has some similarities with those of the Intel Xeon processor E7 family. Within the uncore subsystem, localized performance counter sets are provided at logic control unit scope. For example, each Cbox caching agent has a set of local performance counters, and the power controller unit (PCU) has its own local performance counters. Up to 8 C-Box units are supported in the uncore sub-system.

Table 18-21 summarizes the uncore PMU facilities providing MSR interfaces.

**Table 18-21. Uncore PMU MSR Summary for Intel® Xeon® Processor E5 Family**

| Box   | # of Boxes | Counters per Box | Counter Width | General Purpose | Global Enable | Sub-control MSRs |
|-------|------------|------------------|---------------|-----------------|---------------|------------------|
| C-Box | 8          | 4                | 44            | Yes             | per-box       | None             |
| PCU   | 1          | 4                | 48            | Yes             | per-box       | Match/Mask       |
| U-Box | 1          | 2                | 44            | Yes             | uncore        | None             |

Details of the uncore performance monitoring facility of Intel Xeon Processor E5 family is available in “Intel® Xeon® Processor E5 Uncore Performance Monitoring Programming Reference Manual”. The MSR-based uncore PMU interfaces are listed in Table 2-23.

### 18.3.5 3rd Generation Intel® Core™ Processor Performance Monitoring Facility

The 3rd generation Intel® Core™ processor family and Intel® Xeon® processor E3-1200v2 product family are based on the Ivy Bridge microarchitecture. The performance monitoring facilities in the processor core generally are the same as those described in Section 18.6.3 through Section 18.3.4.5. The non-architectural performance monitoring events supported by the processor core are listed in Table 19-16.

#### 18.3.5.1 Intel® Xeon® Processor E5 v2 and E7 v2 Family Uncore Performance Monitoring Facility

The uncore subsystem in the Intel Xeon processor E5 v2 and Intel Xeon Processor E7 v2 product families are based on the Ivy Bridge-E microarchitecture. There are some similarities with those of the Intel Xeon processor E5 family based on the Sandy Bridge microarchitecture. Within the uncore subsystem, localized performance counter sets are provided at logic control unit scope.

Details of the uncore performance monitoring facility of Intel Xeon Processor E5 v2 and Intel Xeon Processor E7 v2 families are available in “Intel® Xeon® Processor E5 v2 and E7 v2 Uncore Performance Monitoring Programming Reference Manual”. The MSR-based uncore PMU interfaces are listed in Table 2-27.

### 18.3.6 4th Generation Intel® Core™ Processor Performance Monitoring Facility

The 4th generation Intel® Core™ processor and Intel® Xeon® processor E3-1200 v3 product family are based on the Haswell microarchitecture. The core PMU supports architectural performance monitoring capability with version ID 3 (see Section 18.2.3) and a host of non-architectural monitoring capabilities.

Architectural performance monitoring version 3 capabilities are described in Section 18.2.3.

The core PMU's capability is similar to those described in Section 18.6.3 through Section 18.3.4.5, with some differences and enhancements summarized in Table 18-22. Additionally, the core PMU provides some enhancement to support performance monitoring when the target workload contains instruction streams using Intel® Transactional Synchronization Extensions (TSX), see Section 18.3.6.5. For details of Intel TSX, see Chapter 16, "Programming with Intel® Transactional Synchronization Extensions" of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*.

**Table 18-22. Core PMU Comparison**

| Box  | Intel® microarchitecture code name Haswell   | Intel® microarchitecture code name Sandy Bridge  | Comment                                  |
|--|--|--|--|
| # of Fixed counters per thread               | 3  | 3  |  |
| # of general-purpose counters per core       | 8  | 8  |  |
| Counter width (R,W)                          | R:48, W: 32/48   | R:48, W: 32/48   | See Section 18.2.2.                      |
| # of programmable counters per thread        | 4 or (8 if a core not shared by two threads)   | 4 or (8 if a core not shared by two threads)   | Use CPUID to enumerate # of counters.    |
| PMI Overhead Mitigation                      | <ul style="list-style-type: none"> <li>Freeze_Perfmon_on_PMI with legacy semantics.</li> <li>Freeze_on_LBR with legacy semantics for branch profiling.</li> <li>Freeze_while_SMM.</li> </ul> | <ul style="list-style-type: none"> <li>Freeze_Perfmon_on_PMI with legacy semantics.</li> <li>Freeze_on_LBR with legacy semantics for branch profiling.</li> <li>Freeze_while_SMM.</li> </ul> | See Section 17.4.7.                      |
| Processor Event Based Sampling (PEBS) Events | See Table 18-12 and Section 18.3.6.5.1.  | See Table 18-12.   | IA32_PMC4-IA32_PMC7 do not support PEBS. |
| PEBS-Load Latency                            | See Section 18.3.4.4.2.  | See Section 18.3.4.4.2.  |  |
| PEBS-Precise Store                           | No, replaced by Data Address profiling.  | Section 18.3.4.4.3   |  |
| PEBS-PDIR                                    | Yes (using precise INST_RETIRED.ALL)   | Yes (using precise INST_RETIRED.ALL)   |  |
| PEBS-EventingIP                              | Yes  | No   |  |
| Data Address Profiling                       | Yes  | No   |  |
| LBR Profiling                                | Yes  | Yes  |  |
| Call Stack Profiling                         | Yes, see Section 17.11.  | No   | Use LBR facility.                        |
| Off-core Response Event                      | MSR 1A6H and 1A7H; extended request and response types.  | MSR 1A6H and 1A7H; extended request and response types.  |  |
| Intel TSX support for Perfmon                | See Section 18.3.6.5.  | No   |  |

#### 18.3.6.1 Processor Event Based Sampling (PEBS) Facility

The PEBS facility in the 4th Generation Intel Core processor is similar to those in processors based on Intel microarchitecture code name Sandy Bridge, with several enhanced features. The key components and differences of PEBS facility relative to Intel microarchitecture code name Sandy Bridge is summarized in Table 18-23.

**Table 18-23. PEBS Facility Comparison**

| Box                       | Intel® microarchitecture code name Haswell                              | Intel® microarchitecture code name Sandy Bridge       | Comment                                  |
|---------------------------|---|---|--|
| Valid IA32_PMCx           | PMC0-PMC3   | PMC0-PMC3   | No PEBS on PMC4-PMC7                     |
| PEBS Buffer Programming   | Section 18.3.1.1.1  | Section 18.3.1.1.1                                    | Unchanged                                |
| IA32_PEBS_ENABLE Layout   | Figure 18-15  | Figure 18-29  |  |
| PEBS record layout        | Table 18-24; enhanced fields at offsets 98H, A0H, A8H, B0H.             | Table 18-3; enhanced fields at offsets 98H, A0H, A8H. |  |
| Precise Events            | See Table 18-12.  | See Table 18-12.                                      | IA32_PMC4-IA32_PMC7 do not support PEBS. |
| PEBS-Load Latency         | See Table 18-13.  | Table 18-13   |  |
| PEBS-Precise Store        | No, replaced by data address profiling.                                 | Yes; see Section 18.3.4.4.3.                          |  |
| PEBS-PDIR                 | Yes   | Yes   | IA32_PMC1 only.                          |
| PEBS skid from EventingIP | 1 (or 2 if micro+macro fusion)  | 1   |  |
| SAMPLING Restriction      | Small SAV(CountDown) value incur higher overhead than prior generation. |   |  |

Only IA32\_PMC0 through IA32\_PMC3 support PEBS.

#### NOTE

PEBS events are only valid when the following fields of IA32\_PERFEVTSELx are all zero: AnyThread, Edge, Invert, CMask.

In a PMU with PDIR capability, PEBS behavior is unpredictable if IA32\_PERFEVTSELx or IA32\_PMCx is changed for a PEBS-enabled counter while an event is being counted. To avoid this, changes to the programming or value of a PEBS-enabled counter should be performed when the counter is disabled.

### 18.3.6.2 PEBS Data Format

The PEBS record format for the 4th Generation Intel Core processor is shown in Table 18-24. The PEBS record format, along with debug/store area storage format, does not change regardless of whether IA-32e mode is active or not. CPUID.01H:ECX.DTES64[bit 2] reports whether the processor's DS storage format support is mode-independent. When set, it uses 64-bit DS storage format.

**Table 18-24. PEBS Record Format for 4th Generation Intel Core Processor Family**

| Byte Offset | Field    | Byte Offset | Field                                     |
|-------------|----------|-------------|---|
| 00H         | R/EFLAGS | 60H         | R10                                       |
| 08H         | R/EIP    | 68H         | R11                                       |
| 10H         | R/EAX    | 70H         | R12                                       |
| 18H         | R/EBX    | 78H         | R13                                       |
| 20H         | R/ECX    | 80H         | R14                                       |
| 28H         | R/EDX    | 88H         | R15                                       |
| 30H         | R/ESI    | 90H         | IA32_PERF_GLOBAL_STATUS                   |
| 38H         | R/EDI    | 98H         | Data Linear Address                       |
| 40H         | R/EBP    | A0H         | Data Source Encoding                      |
| 48H         | R/ESP    | A8H         | Latency value (core cycles)               |
| 50H         | R8       | B0H         | EventingIP                                |
| 58H         | R9       | B8H         | TX Abort Information (Section 18.3.6.5.1) |

The layout of PEBS records are almost identical to those shown in Table 18-3. Offset B0H is a new field that records the eventing IP address of the retired instruction that triggered the PEBS assist.

The PEBS records at offsets 98H, A0H, and ABH record data gathered from three of the PEBS capabilities in prior processor generations: load latency facility (Section 18.3.4.4.2), PDIR (Section 18.3.4.4.4), and the equivalent capability of precise store in prior generation (see Section 18.3.6.3).

In the core PMU of the 4th generation Intel Core processor, load latency facility and PDIR capabilities are unchanged. However, precise store is replaced by an enhanced capability, data address profiling, that is not restricted to store address. Data address profiling also records information in PEBS records at offsets 98H, A0H, and ABH.

### 18.3.6.3 PEBS Data Address Profiling

The Data Linear Address facility is also abbreviated as DataLA. The facility is a replacement or extension of the precise store facility in previous processor generations. The DataLA facility complements the load latency facility by providing a means to profile load and store memory references in the system, leverages the PEBS facility, and provides additional information about sampled loads and stores. Having precise memory reference events with linear address information for both loads and stores provides information to improve data structure layout, eliminate remote node references, and identify cache-line conflicts in NUMA systems.

The DataLA facility in the 4th generation processor supports the following events configured to use PEBS:

**Table 18-25. Precise Events That Supports Data Linear Address Profiling**

| Event Name                       | Event Name                                |
|----------------------------------|---|
| MEM_UOPS_RETIRED.STLB_MISS_LOADS | MEM_UOPS_RETIRED.STLB_MISS_STORES         |
| MEM_UOPS_RETIRED.LOCK_LOADS      | MEM_UOPS_RETIRED.SPLIT_STORES             |
| MEM_UOPS_RETIRED.SPLIT_LOADS     | MEM_UOPS_RETIRED.ALL_STORES               |
| MEM_UOPS_RETIRED.ALL_LOADS       | MEM_LOAD_UOPS_LLC_MISS_RETIRED.LOCAL_DRAM |
| MEM_LOAD_UOPS_RETIRED.L1_HIT     | MEM_LOAD_UOPS_RETIRED.L2_HIT              |
| MEM_LOAD_UOPS_RETIRED.L3_HIT     | MEM_LOAD_UOPS_RETIRED.L1_MISS             |
| MEM_LOAD_UOPS_RETIRED.L2_MISS    | MEM_LOAD_UOPS_RETIRED.L3_MISS             |
| MEM_LOAD_UOPS_RETIRED.HIT_LFB    | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_MISS    |

**Table 18-25. Precise Events That Supports Data Linear Address Profiling (Contd.)**

| Event Name                                    | Event Name                              |
|---|---|
| MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HIT         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HITM  |
| UOPS_RETIRED.ALL (if load or store is tagged) | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_NONE |

DataLA can use any one of the IA32\_PMC0-IA32\_PMC3 counters. Counter overflows will initiate the generation of PEBS records. Upon counter overflow, hardware captures the linear address and possible other status information of the retiring memory uop. This information is then written to the PEBS record that is subsequently generated.

To enable the DataLA facility, software must complete the following steps. Please note that the DataLA facility relies on the PEBS facility, so the PEBS configuration requirements must be completed before attempting to capture DataLA information.

- Complete the PEBS configuration steps.
- Program the an event listed in Table 18-25 using any one of IA32\_PERFEVTSEL0-IA32\_PERFEVTSEL3.
- Set the corresponding IA32\_PEBS\_ENABLE.PEBS\_EN\_CTRx bit. This enables the corresponding IA32\_PMCx as a PEBS counter and enables the DataLA facility.

When the DataLA facility is enabled, the relevant information written into a PEBS record affects entries at offsets 98H, A0H and A8H, as shown in Table 18-26.

**Table 18-26. Layout of Data Linear Address Information In PEBS Record**

| Field               | Offset | Description   |
|---------------------|--------|---|
| Data Linear Address | 98H    | The linear address of the load or the destination of the store.   |
| Store Status        | A0H    | <ul style="list-style-type: none"> <li>▪ <b>DCU Hit</b> (Bit 0): The store hit the data cache closest to the core (L1 cache) if this bit is set, otherwise the store missed the data cache. This information is valid only for the following store events: UOPS_RETIRED.ALL (if store is tagged), MEM_UOPS_RETIRED.STLB_MISS_STORES, MEM_UOPS_RETIRED.SPLIT_STORES, MEM_UOPS_RETIRED.ALL_STORES</li> <li>▪ Other bits are zero, The STLB_MISS, LOCK bit information can be obtained by programming the corresponding store event in Table 18-25.</li> </ul> |
| Reserved            | A8H    | Always zero.  |

#### 18.3.6.3.1 EventingIP Record

The PEBS record layout for processors based on Intel microarchitecture code name Haswell adds a new field at offset 0B0H. This is the eventingIP field that records the IP address of the retired instruction that triggered the PEBS assist. The EIP/RIP field at offset 08H records the IP address of the next instruction to be executed following the PEBS assist.

#### 18.3.6.4 Off-core Response Performance Monitoring

The core PMU facility to collect off-core response events are similar to those described in Section 18.3.4.5. The event codes are listed in Table 18-15. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR\_OFFCORE\_RSP\_x. Software must program MSR\_OFFCORE\_RSP\_x according to:

- Transaction request type encoding (bits 15:0): see Table 18-27.
- Supplier information (bits 30:16): see Table 18-28.
- Snoop response information (bits 37:31): see Table 18-18.

**Table 18-27. MSR\_OFFCORE\_RSP\_x Request\_Type Definition (Haswell microarchitecture)**

| Bit Name           | Offset | Description  |
|--------------------|--------|--|
| DMND_DATA_RD       | 0      | (R/W). Counts the number of demand data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count L2 data read prefetches or instruction fetches. |
| DMND_RFO           | 1      | (R/W). Counts the number of demand and DCU prefetch reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.                                     |
| DMND_IFETCH        | 2      | (R/W). Counts the number of demand and DCU prefetch instruction cacheline reads. Does not count L2 code read prefetches.   |
| COREWB             | 3      | (R/W). Counts the number of modified cachelines written back.  |
| PF_DATA_RD         | 4      | (R/W). Counts the number of data cacheline reads generated by L2 prefetchers.  |
| PF_RFO             | 5      | (R/W). Counts the number of RFO requests generated by L2 prefetchers.  |
| PF_IFETCH          | 6      | (R/W). Counts the number of code reads generated by L2 prefetchers.  |
| PF_L3_DATA_RD      | 7      | (R/W). Counts the number of data cacheline reads generated by L3 prefetchers.  |
| PF_L3_RFO          | 8      | (R/W). Counts the number of RFO requests generated by L3 prefetchers.  |
| PF_L3_CODE_RD      | 9      | (R/W). Counts the number of code reads generated by L3 prefetchers.  |
| SPLIT_LOCK_UC_LOCK | 10     | (R/W). Counts the number of lock requests that split across two cachelines or are to UC memory.  |
| STRM_ST            | 11     | (R/W). Counts the number of streaming store requests electronically.   |
| Reserved           | 12-14  | Reserved   |
| OTHER              | 15     | (R/W). Any other request that crosses IDI, including I/O.  |

The supplier information field listed in Table 18-28. The fields vary across products (according to CPUID signatures) and is noted in the description.

**Table 18-28. MSR\_OFFCORE\_RSP\_x Supplier Info Field Definition (CPUID Signature 06\_3CH, 06\_46H)**

| Subtype       | Bit Name | Offset | Description                                    |
|---------------|----------|--------|--|
| Common        | Any      | 16     | (R/W). Catch all value for any response types. |
| Supplier Info | NO_SUPP  | 17     | (R/W). No Supplier Information available       |
|               | L3_HITM  | 18     | (R/W). M-state initial lookup stat in L3.      |
|               | L3_HITE  | 19     | (R/W). E-state                                 |
|               | L3_HITS  | 20     | (R/W). S-state                                 |
|               | Reserved | 21     | Reserved                                       |
|               | LOCAL    | 22     | (R/W). Local DRAM Controller                   |
|               | Reserved | 30:23  | Reserved                                       |

**Table 18-29. MSR\_OFFCORE\_RSP\_x Supplier Info Field Definition (CUID Signature 06\_45H)**

| Subtype       | Bit Name               | Offset | Description                                    |
|---------------|------------------------|--------|--|
| Common        | Any                    | 16     | (R/W). Catch all value for any response types. |

|               | L4_HIT_REMOTE_HOP2P_L4 | 25     | (R/W). L4 Cache                                |
|               | Reserved               | 30:26  | Reserved                                       |

#### 18.3.6.4.1 Off-core Response Performance Monitoring in Intel Xeon Processors E5 v3 Series

Table 18-28 lists the supplier information field that apply to Intel Xeon processor E5 v3 series (CUID signature 06\_3FH).

**Table 18-30. MSR\_OFFCORE\_RSP\_x Supplier Info Field Definition**

| Subtype       | Bit Name             | Offset | Description                                    |
|---------------|----------------------|--------|--|
| Common        | Any                  | 16     | (R/W). Catch all value for any response types. |
| Supplier Info | NO_SUPP              | 17     | (R/W). No Supplier Information available       |
|               | L3_HITM              | 18     | (R/W). M-state initial lookup stat in L3.      |
|               | L3_HITE              | 19     | (R/W). E-state                                 |
|               | L3_HITS              | 20     | (R/W). S-state                                 |
|               | L3_HITF              | 21     | (R/W). F-state                                 |
|               | LOCAL                | 22     | (R/W). Local DRAM Controller                   |
|               | Reserved             | 26:23  | Reserved                                       |
|               | L3_MISS_REMOTE_HOP0  | 27     | (R/W). Hop 0 Remote supplier                   |
|               | L3_MISS_REMOTE_HOP1  | 28     | (R/W). Hop 1 Remote supplier                   |
|               | L3_MISS_REMOTE_HOP2P | 29     | (R/W). Hop 2 or more Remote supplier           |
|               | Reserved             | 30     | Reserved                                       |

#### 18.3.6.5 Performance Monitoring and Intel® TSX

Chapter 16 of *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1* describes the details of Intel® Transactional Synchronization Extensions (Intel TSX). This section describes performance monitoring support for Intel TSX.

If a processor supports Intel TSX, the core PMU enhances its IA32\_PERFEVTSELx MSR with two additional bit fields for event filtering. Support for Intel TSX is indicated by either (a) CUID.(EAX=7, ECX=0):RTM[bit 11]=1, or (b) if CUID.07H.EBX.HLE [bit 4] = 1. The TSX-enhanced layout of IA32\_PERFEVTSELx is shown in Figure 18-34. The two additional bit fields are:

- **IN\_TX** (bit 32): When set, the counter will only include counts that occurred inside a transactional region, regardless of whether that region was aborted or committed. This bit may only be set if the processor supports HLE or RTM.
- **IN\_TXCP** (bit 33): When set, the counter will not include counts that occurred inside of an aborted transactional region. This bit may only be set if the processor supports HLE or RTM. This bit may only be set for IA32\_PERFEVTSEL2.

When the IA32\_PERFEVTSELx MSR is programmed with both IN\_TX=0 and IN\_TXCP=0 on a processor that supports Intel TSX, the result in a counter may include detectable conditions associated with a transaction code region for its aborted execution (if any) and completed execution.

In the initial implementation, software may need to take pre-caution when using the IN\_TXCP bit. see Table 2-28.

**Figure 18-34. Layout of IA32\_PERFEVTSELx MSRs Supporting Intel TSX**

A common usage of setting IN\_TXCP=1 is to capture the number of events that were discarded due to a transactional abort. With IA32\_PMC2 configured to count in such a manner, then when a transactional region aborts, the value for that counter is restored to the value it had prior to the aborted transactional region. As a result, any updates performed to the counter during the aborted transactional region are discarded.

On the other hand, setting IN\_TX=1 can be used to drill down on the performance characteristics of transactional code regions. When a PMCx is configured with the corresponding IA32\_PERFEVTSELx.IN\_TX=1, only eventing conditions that occur inside transactional code regions are propagated to the event logic and reflected in the counter result. Eventing conditions specified by IA32\_PERFEVTSELx but occurring outside a transactional region are discarded. The following example illustrates using three counters to drill down cycles spent inside and outside of transactional regions:

- Program IA32\_PERFEVTSEL2 to count Unhalted\_Core\_Cycles with (IN\_TXCP=1, IN\_TX=0), such that IA32\_PMC2 will count cycles spent due to aborted TSX transactions;
- Program IA32\_PERFEVTSEL0 to count Unhalted\_Core\_Cycles with (IN\_TXCP=0, IN\_TX=1), such that IA32\_PMC0 will count cycles spent by the transactional code regions;
- Program IA32\_PERFEVTSEL1 to count Unhalted\_Core\_Cycles with (IN\_TXCP=0, IN\_TX=0), such that IA32\_PMC1 will count total cycles spent by the non-transactional code and transactional code regions.

Additionally, a number of performance events are solely focused on characterizing the execution of Intel TSX transactional code, they are listed in Table 19-10.

#### 18.3.6.5.1 Intel TSX and PEBS Support

If a PEBS event would have occurred inside a transactional region, then the transactional region first aborts, and then the PEBS event is processed.

Two of the TSX performance monitoring events in Table 19-10 also support using PEBS facility to capture additional information. They are:

- HLE\_RETIREDA.BORT ED (encoding C8H mask 04H),
- RTM\_RETIREDA.BORTED (encoding C9H mask 04H).

A transactional abort (HLE\_RETIREDA.BORTED,RTM\_RETIREDA.BORTED) can also be programmed to cause PEBS events. In this scenario, a PEBS event is processed following the abort.

Pending a PEBS record inside of a transactional region will cause a transactional abort. If a PEBS record was pended at the time of the abort or on an overflow of the TSX PEBS events listed above, only the following PEBS entries will be valid (enumerated by PEBS entry offset B8H bits[33:32] to indicate an HLE abort or an RTM abort):

- Offset B0H: EventingIP,
- Offset B8H: TX Abort Information

These fields are set for all PEBS events.

- Offset 08H (RIP/EIP) corresponds to the instruction following the outermost XACQUIRE in HLE or the first instruction of the fallback handler of the outermost XBEGIN instruction in RTM. This is useful to identify the aborted transactional region.

In the case of HLE, an aborted transaction will restart execution deterministically at the start of the HLE region. In the case of RTM, an aborted transaction will transfer execution to the RTM fallback handler.

The layout of the TX Abort Information field is given in Table 18-31.

**Table 18-31. TX Abort Information Field Definition**

| Bit Name              | Offset | Description   |
|-----------------------|--------|---|
| Cycles_Last_TX        | 31:0   | The number of cycles in the last TSX region, regardless of whether that region had aborted or committed.                              |
| HLE_Abort             | 32     | If set, the abort information corresponds to an aborted HLE execution   |
| RTM_Abort             | 33     | If set, the abort information corresponds to an aborted RTM execution   |
| Instruction_Abort     | 34     | If set, the abort was associated with the instruction corresponding to the eventing IP (offset 0B0H) within the transactional region. |
| Non_Instruction_Abort | 35     | If set, the instruction corresponding to the eventing IP may not necessarily be related to the transactional abort.                   |
| Retry                 | 36     | If set, retrying the transactional execution may have succeeded.  |
| Data_Conflict         | 37     | If set, another logical processor conflicted with a memory address that was part of the transactional region that aborted.            |
| Capacity Writes       | 38     | If set, the transactional region aborted due to exceeding resources for transactional writes.   |
| Capacity Reads        | 39     | If set, the transactional region aborted due to exceeding resources for transactional reads.  |
| Reserved              | 63:40  | Reserved  |

### 18.3.6.6 Uncore Performance Monitoring Facilities in the 4th Generation Intel® Core™ Processors

The uncore sub-system in the 4th Generation Intel® Core™ processors provides its own performance monitoring facility. The uncore PMU facility provides dedicated MSRs to select uncore performance monitoring events in a similar manner as those described in Section 18.3.4.6.

The ARB unit and each C-Box provide local pairs of event select MSR and counter register. The layout of the event select MSRs in the C-Boxes are identical as shown in Figure 18-32.

At the uncore domain level, there is a master set of control MSRs that centrally manages all the performance monitoring facility of uncore units. Figure 18-33 shows the layout of the uncore domain global control.

Additionally, there is also a fixed counter, counting uncore clockticks, for the uncore domain. Table 18-19 summarizes the number MSRs for uncore PMU for each box.

**Table 18-32. Uncore PMU MSR Summary**

| Box           | # of Boxes   | Counters per Box | Counter Width | General Purpose | Global Enable | Comment                                       |
|---------------|--------------|------------------|---------------|-----------------|---------------|---|
| C-Box         | SKU specific | 2                | 44            | Yes             | Per-box       | Up to 4, see Table 2-20<br>MSR_UNC_CBO_CONFIG |
| ARB           | 1            | 2                | 44            | Yes             | Uncore        |   |
| Fixed Counter | N.A.         | N.A.             | 48            | No              | Uncore        |   |

The uncore performance events for the C-Box and ARB units are listed in Table 19-11.

### 18.3.6.7 Intel® Xeon® Processor E5 v3 Family Uncore Performance Monitoring Facility

Details of the uncore performance monitoring facility of Intel Xeon Processor E5 v3 families are available in “Intel® Xeon® Processor E5 v3 Uncore Performance Monitoring Programming Reference Manual”. The MSR-based uncore PMU interfaces are listed in Table 2-32.

## 18.3.7 5th Generation Intel® Core™ Processor and Intel® Core™ M Processor Performance Monitoring Facility

The 5th Generation Intel® Core™ processor and the Intel® Core™ M processor families are based on the Broadwell microarchitecture. The core PMU supports architectural performance monitoring capability with version ID 3 (see Section 18.2.3) and a host of non-architectural monitoring capabilities.

Architectural performance monitoring version 3 capabilities are described in Section 18.2.3.

The core PMU has the same capability as those described in Section 18.3.6. IA32\_PERF\_GLOBAL\_STATUS provide a bit indicator (bit 55) for PMI handler to distinguish PMI due to output buffer overflow condition due to accumulating packet data from Intel Processor Trace.

**Figure 18-35. IA32\_PERF\_GLOBAL\_STATUS MSR in Broadwell Microarchitecture**

Details of Intel Processor Trace is described in Chapter 35, “Intel® Processor Trace”. IA32\_PERF\_GLOBAL\_OVF\_CTRL MSR provide a corresponding reset control bit.

Figure 18-36. IA32\_PERF\_GLOBAL\_OVF\_CTRL MSR in Broadwell microarchitecture

The specifics of non-architectural performance events are listed in Chapter 19, “Performance Monitoring Events”.

### 18.3.8 6th Generation Intel® Core™ Processor and 7th Generation Intel® Core™ Processor Performance Monitoring Facility

The 6th generation Intel® Core™ processor is based on the Skylake microarchitecture. The 7th generation Intel® Core™ processor is based on the Kaby Lake microarchitecture. The core PMU supports architectural performance monitoring capability with version ID 4 (see Section 18.2.4) and a host of non-architectural monitoring capabilities. Architectural performance monitoring version 4 capabilities are described in Section 18.2.4.

The core PMU’s capability is similar to those described in Section 18.6.3 through Section 18.3.4.5, with some differences and enhancements summarized in Table 18-22. Additionally, the core PMU provides some enhancement to support performance monitoring when the target workload contains instruction streams using Intel® Transactional Synchronization Extensions (TSX), see Section 18.3.6.5. For details of Intel TSX, see Chapter 16, “Programming with Intel® Transactional Synchronization Extensions” of *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1*.

Performance monitoring result may be affected by side-band activity on processors that support Intel SGX, details are described in Chapter 42, “Enclave Code Debug and Profiling”.

Table 18-33. Core PMU Comparison

| Box  | Intel® microarchitecture code name Skylake and Kaby Lake  | Intel® microarchitecture code name Haswell and Broadwell   | Comment  |
|--|---|--|--|
| # of Fixed counters per thread                                       | 3   | 3  |  |
| # of general-purpose counters per core                               | 8   | 8  |  |
| Counter width (R,W)  | R:48, W: 32/48  | R:48, W: 32/48   | See Section 18.2.2.  |
| # of programmable counters per thread                                | 4 or (8 if a core not shared by two threads)  | 4 or (8 if a core not shared by two threads)   | CPUID enumerates # of counters.  |
| Architectural Perfmon version  | 4   | 3  | See Section 18.2.4   |

### 18.3.8.1 Processor Event Based Sampling (PEBS) Facility

The PEBS facility in the 6th and 7th generation Intel Core processors provides a number enhancement relative to PEBS in processors based on Haswell/Broadwell microarchitectures. The key components and differences of PEBS facility relative to Haswell/Broadwell microarchitecture is summarized in Table 18-34.

**Table 18-34. PEBS Facility Comparison**

| Box                           | Intel® microarchitecture code name Skylake and Kaby Lake                       | Intel® microarchitecture code name Haswell and Broadwell    | Comment                                  |
|-------------------------------|--|---|--|
| Valid IA32_PMCx               | PMC0-PMC3  | PMC0-PMC3   | No PEBS on PMC4-PMC7.                    |
| PEBS Buffer Programming       | Section 18.3.1.1.1   | Section 18.3.1.1.1  | Unchanged                                |
| IA32_PEBS_ENABLE Layout       | Figure 18-15   | Figure 18-15  |  |
| PEBS-EventingIP               | Yes  | Yes   |  |
| PEBS record format encoding   | 0011b  | 0010b   |  |
| PEBS record layout            | Table 18-35; enhanced fields at offsets 98H- B8H; and TSC record field at C0H. | Table 18-24; enhanced fields at offsets 98H, A0H, A8H, B0H. |  |
| Multi-counter PEBS resolution | PEBS record 90H resolves the eventing counter overflow.                        | PEBS record 90H reflects IA32_PERF_GLOBAL_STATUS.           |  |
| Precise Events                | See Table 18-36.   | See Table 18-12.  | IA32_PMC4-IA32_PMC7 do not support PEBS. |
| PEBS-PDIR                     | Yes  | Yes   | IA32_PMC1 only.                          |
| PEBS-Load Latency             | See Section 18.3.4.4.2.  | See Section 18.3.4.4.2.                                     |  |
| Data Address Profiling        | Yes  | Yes   |  |
| FrontEnd event support        | FrontEnd_Retried event and MSR_PEBS_FRONTEND.                                  | No  | IA32_PMC0-PMC3 only.                     |

Only IA32\_PMC0 through IA32\_PMC3 support PEBS.

## NOTES

Precise events are only valid when the following fields of IA32\_PERFEVTSELx are all zero: AnyThread, Edge, Invert, CMask.

In a PMU with PDIR capability, PEBS behavior is unpredictable if IA32\_PERFEVTSELx or IA32\_PMCx is changed for a PEBS-enabled counter while an event is being counted. To avoid this, changes to the programming or value of a PEBS-enabled counter should be performed when the counter is disabled.

### 18.3.8.1.1 PEBS Data Format

The PEBS record format for the 6th and 7th generation Intel Core processors is reporting with encoding 0011b in IA32\_PERF\_CAPABILITIES[11:8]. The lay out is shown in Table 18-35. The PEBS record format, along with debug/store area storage format, does not change regardless of whether IA-32e mode is active or not. CPUID.01H:ECX.DTES64[bit 2] reports whether the processor's DS storage format support is mode-independent. When set, it uses 64-bit DS storage format.

**Table 18-35. PEBS Record Format for 6th Generation Intel Core Processor and 7th Generation Intel Core Processor Families**

| Byte Offset | Field    | Byte Offset | Field                                     |
|-------------|----------|-------------|---|
| 00H         | R/EFLAGS | 68H         | R11                                       |
| 08H         | R/EIP    | 70H         | R12                                       |
| 10H         | R/EAX    | 78H         | R13                                       |
| 18H         | R/EBX    | 80H         | R14                                       |
| 20H         | R/ECX    | 88H         | R15                                       |
| 28H         | R/EDX    | 90H         | Applicable Counter                        |
| 30H         | R/ESI    | 98H         | Data Linear Address                       |
| 38H         | R/EDI    | A0H         | Data Source Encoding                      |
| 40H         | R/EBP    | A8H         | Latency value (core cycles)               |
| 48H         | R/ESP    | B0H         | EventingIP                                |
| 50H         | R8       | B8H         | TX Abort Information (Section 18.3.6.5.1) |
| 58H         | R9       | C0H         | TSC                                       |
| 60H         | R10      |             |   |

The layout of PEBS records are largely identical to those shown in Table 18-24.

The PEBS records at offsets 98H, A0H, and ABH record data gathered from three of the PEBS capabilities in prior processor generations: load latency facility (Section 18.3.4.4.2), PDIR (Section 18.3.4.4.4), and data address profiling (Section 18.3.6.3).

In the core PMU of the 6th and 7th generation Intel Core processors, load latency facility and PDIR capabilities and data address profiling are unchanged relative to the 4th and 5th generation Intel Core processors. Similarly, precise store is replaced by data address profiling.

With format 0010b, a snapshot of the IA32\_PERF\_GLOBAL\_STATUS may be useful to resolve the situations when more than one of IA32\_PMICx have been configured to collect PEBS data and two consecutive overflows of the PEBS-enabled counters are sufficiently far apart in time. It is also possible for the image at 90H to indicate multiple PEBS-enabled counters have overflowed. In the latter scenario, software cannot to correlate the PEBS record entry to the multiple overflowed bits.

With PEBS record format encoding 0011b, offset 90H reports the “applicable counter” field, which is a multi-counter PEBS resolution index allowing software to correlate the PEBS record entry with the eventing PEBS overflow when multiple counters are configured to record PEBS records. Additionally, offset C0H captures a snapshot of the TSC that provides a time line annotation for each PEBS record entry.

### 18.3.8.1.2 PEBS Events

The list of precise events supported for PEBS in the Skylake and Kaby Lake microarchitectures is shown in Table 18-36.

**Table 18-36. Precise Events for the Skylake and Kaby Lake Microarchitectures**

| Event Name                           | Event Select | Sub-event                    | UMask |
|--------------------------------------|--------------|------------------------------|-------|
| INST_RETIRED                         | C0H          | PREC_DIST <sup>1</sup>       | 01H   |
|                                      |              | ALL_CYCLES <sup>2</sup>      | 01H   |
| OTHER_ASSISTS                        | C1H          | ANY                          | 3FH   |
| BR_INST_RETIRED                      | C4H          | CONDITIONAL                  | 01H   |
|                                      |              | NEAR_CALL                    | 02H   |
|                                      |              | ALL_BRANCHES                 | 04H   |
|                                      |              | NEAR_RETURN                  | 08H   |
|                                      |              | NEAR_TAKEN                   | 20H   |
|                                      |              | FAR_BRACHES                  | 40H   |
| BR_MISP_RETIRED                      | C5H          | CONDITIONAL                  | 01H   |
|                                      |              | ALL_BRANCHES                 | 04H   |
|                                      |              | NEAR_TAKEN                   | 20H   |
| FRONTEND_RETIRED                     | C6H          | <Programmable <sup>3</sup> > | 01H   |
| HLE_RETIRED                          | C8H          | ABORTED                      | 04H   |
| RTM_RETIRED                          | C9H          | ABORTED                      | 04H   |
| MEM_INST_RETIRED <sup>2</sup>        | D0H          | LOCK_LOADS                   | 21H   |
|                                      |              | SPLIT_LOADS                  | 41H   |
|                                      |              | SPLIT_STORES                 | 42H   |
|                                      |              | ALL_LOADS                    | 81H   |
|                                      |              | ALL_STORES                   | 82H   |
| MEM_LOAD_RETIRED <sup>4</sup>        | D1H          | L1_HIT                       | 01H   |
|                                      |              | L2_HIT                       | 02H   |
|                                      |              | L3_HIT                       | 04H   |
|                                      |              | L1_MISS                      | 08H   |
|                                      |              | L2_MISS                      | 10H   |
|                                      |              | L3_MISS                      | 20H   |

| MEM_LOAD_L3_HIT_RETIRED <sup>2</sup> | D2H          | XSNP_MISS                    | 01H   |
|                                      |              | XSNP_HIT                     | 02H   |
|                                      |              | XSNP_HITM                    | 04H   |
|                                      |              | XSNP_NONE                    | 08H   |

**NOTES:**

1. Only available on IA32\_PMC1.
2. INST\_RETIRED.ALL\_CYCLES is configured with additional parameters of cmask = 10 and INV = 1
3. Subevents are specified using MSR\_PEBBS\_FRONTEND, see Section 18.3.8.2
4. Instruction with at least one load uop experiencing the condition specified in the UMask.

**18.3.8.1.3 Data Address Profiling**

The PEBS Data address profiling on the 6th and 7th generation Intel Core processors is largely unchanged from prior generation. When the DataLA facility is enabled, the relevant information written into a PEBS record affects entries at offsets 98H, A0H and A8H, as shown in Table 18-26.

**Table 18-37. Layout of Data Linear Address Information In PEBS Record**

| Field               | Offset | Description   |
|---------------------|--------|---|
| Data Linear Address | 98H    | The linear address of the load or the destination of the store.   |
| Store Status        | A0H    | <ul style="list-style-type: none"> <li>▪ <b>DCU Hit</b> (Bit 0): The store hit the data cache closest to the core (L1 cache) if this bit is set, otherwise the store missed the data cache. This information is valid only for the following store events: UOPS_RETIRED.ALL (if store is tagged), MEM_INST_RETIRED.STLB_MISS_STORES, MEM_INST_RETIRED.ALL_STORES, MEM_INST_RETIRED.SPLIT_STORES.</li> <li>▪ Other bits are zero.</li> </ul> |
| Reserved            | A8H    | Always zero.  |

#### 18.3.8.1.4 PEBS Facility for Front End Events

In the 6th and 7th generation Intel Core processors, the PEBS facility has been extended to allow capturing PEBS data for some microarchitectural conditions related to front end events. The frontend microarchitectural conditions supported by PEBS requires the following interfaces:

- The IA32\_PERFEVTSELx MSR must select “FrontEnd\_Retired” (C6H) in the EventSelect field (bits 7:0) and umask = 01H,
- The “FRONTEND\_RETIRED” event employs a new MSR, MSR\_PEBS\_FRONTEND, to specify the supported frontend event details, see Table 18-38.
- Program the PEBS\_EN\_PMCx field of IA32\_PEBS\_ENABLE MSR as required.

Note the AnyThread field of IA32\_PERFEVTSELx is ignored by the processor for the “FRONTEND\_RETIRED” event.

The sub-event encodings supported by MSR\_PEBS\_FRONTEND.EVTSEL is given in Table 18-38.

**Table 18-38. FrontEnd\_Retired Sub-Event Encodings Supported by MSR\_PEBS\_FRONTEND.EVTSEL**

| Sub-Event Name   | EVTSEL | Description   |
|------------------|--------|---|
| DSB_MISS         | 11H    | Retired Instructions which experienced decode stream buffer (DSB) miss.   |
| L1I_MISS         | 12H    | The fetch of retired Instructions which experienced Instruction L1 Cache true miss <sup>1</sup> . Additional requests to the same cache line as an in-flight L1I cache miss will not be counted.  |
| L2_MISS          | 13H    | The fetch of retired Instructions which experienced L2 Cache true miss. Additional requests to the same cache line as an in-flight MLC cache miss will not be counted.  |
| ITLB_MISS        | 14H    | The fetch of retired Instructions which experienced ITLB true miss. Additional requests to the same cache line as an in-flight ITLB miss will not be counted.   |
| STLB_MISS        | 15H    | The fetch of retired Instructions which experienced STLB true miss. Additional requests to the same cache line as an in-flight STLB miss will not be counted.   |
| IDQ_READ_BUBBLES | 6H     | <p>An IDQ read bubble is defined as any one of the 4 allocation slots of IDQ that is not filled by the front-end on any cycle where there is no back end stall. Using the threshold and latency fields in MSR_PEBS_FRONTEND allows counting of IDQ read bubbles of various magnitude and duration. Latency controls the number of cycles and Threshold controls the number of allocation slots that contain bubbles.</p> <p>The event counts if and only if a sequence of at least FE_LATENCY consecutive cycles contain at least FE_TRESHOLD number of bubbles each.</p> |

#### NOTES:

1. A true miss is the first miss for a cacheline/page (excluding secondary misses that fall into same cacheline/page).

The layout of MSR\_PEBS\_FRONTEND is given in Table 18-39.

**Table 18-39. MSR\_PEBS\_FRONTEND Layout**

| Bit Name          | Offset | Description   |
|-------------------|--------|---|
| EVTSEL            | 7:0    | Encodes the sub-event within FrontEnd_Retired that can use PEBS facility, see Table 18-38.                                      |
| IDQ_Bubble_Length | 19:8   | Specifies the threshold of continuously elapsed cycles for the specified width of bubbles when counting IDQ_READ_BUBBLES event. |
| IDQ_Bubble_Width  | 22:20  | Specifies the threshold of simultaneous bubbles when counting IDQ_READ_BUBBLES event.   |
| Reserved          | 63:23  | Reserved  |

#### 18.3.8.1.5 FRONTEND\_RETIRED

The FRONTEND\_RETIRED event is designed to help software developers identify exact instructions that caused front-end issues. There are some instances in which the event will, by design, the under-counting scenarios include the following:

- The event counts only retired (non-speculative) Frontend events, i.e. events from just true program execution path are counted.
- The event will count once per cacheline (at most). If a cacheline contains multiple instructions which caused front-end misses, the count will be only 1 for that line.
- If the multibyte sequence of an instruction spans across two cachelines and causes a miss it will be recorded once. If there were additional misses in the second cacheline, they will not be counted separately.
- If a multi-uop instruction exceeds the allocation width of one cycle, the bubbles associated with these uops will be counted once per that instruction.
- If 2 instructions are fused (macro-fusion), and either of them or both cause front-end misses, it will be counted once for the fused instruction.
- If a frontend (miss) event occurs outside instruction boundary (e.g. due to processor handling of architectural event), it may be reported for the next instruction to retire.

#### 18.3.8.2 Off-core Response Performance Monitoring

The core PMU facility to collect off-core response events are similar to those described in Section 18.3.4.5. Each event code for off-core response monitoring requires programming an associated configuration MSR, MSR\_OFFCORE\_RSP\_x. Software must program MSR\_OFFCORE\_RSP\_x according to:

- Transaction request type encoding (bits 15:0): see Table 18-40.
- Supplier information (bits 30:16): see Table 18-41.
- Snoop response information (bits 37:31): see Table 18-42.

**Table 18-40. MSR\_OFFCORE\_RSP\_x Request\_Type Definition (Skylake and Kaby Lake Microarchitectures)**

| Bit Name      | Offset | Description   |
|---------------|--------|---|
| DMND_DATA_RD  | 0      | (R/W). Counts the number of demand data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count hw or sw prefetches. |
| DMND_RFO      | 1      | (R/W). Counts the number of demand reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.                           |
| DMND_IFETCH   | 2      | (R/W). Counts the number of demand and DCU prefetch instruction cacheline reads. Does not count L2 code read prefetches.  |
| Reserved      | 6:3    | Reserved  |
| PF_L3_DATA_RD | 7      | (R/W). Counts the number of MLC prefetches into L3.   |
| PF_L3_RFO     | 8      | (R/W). Counts the number of RFO requests generated by MLC prefetches to L3.   |
| Reserved      | 10:9   | Reserved  |
| STRM_ST       | 11     | (R/W). Counts the number of streaming store requests.   |
| Reserved      | 14:12  | Reserved  |
| OTHER         | 15     | (R/W). Any other request that crosses IDI, including I/O.   |

Table 18-41 lists the supplier information field that applies to 6th and 7th generation Intel Core processors. (6th generation Intel Core processor CPUID signature: 06\_4EH, 06\_5EH; 7th generation Intel Core processor CPUID signature: 06\_8EH, 06\_9EH).

**Table 18-41. MSR\_OFFCORE\_RSP\_x Supplier Info Field Definition (CPUID Signature 06\_4EH, 06\_5EH and 06\_8EH, 06\_9EH)**

| Subtype       | Bit Name | Offset | Description  |
|---------------|----------|--------|--|
| Common        | Any      | 16     | (R/W). Catch all value for any response types.                     |
| Supplier Info | NO_SUPP  | 17     | (R/W). No Supplier Information available.                          |
|               | L3_HITM  | 18     | (R/W). M-state initial lookup stat in L3.                          |
|               | L3_HITE  | 19     | (R/W). E-state   |
|               | L3_HITS  | 20     | (R/W). S-state   |
|               | Reserved | 21     | Reserved   |
|               | L4_HIT   | 22     | (R/W). L4 Cache (if L4 is present in the processor)                |
|               | Reserved | 25:23  | Reserved   |
|               | DRAM     | 26     | (R/W). Local Node  |
|               | Reserved | 29:27  | Reserved   |
|               | SPL_HIT  | 30     | (R/W). L4 cache super line hit (if L4 is present in the processor) |

Table 18-42 lists the snoop information field that apply to processors with CPUID signatures 06\_4EH, 06\_5EH, 06\_8EH, 06\_9E, and 06\_55H.

**Table 18-42. MSR\_OFFCORE\_RSP\_x Snoop Info Field Definition (CUID Signatures 06\_4EH, 06\_5EH, 06\_8EH, 06\_9E and 06\_55H)**

| Subtype    | Bit Name           | Offset | Description  |
|------------|--------------------|--------|--|
| Snoop Info | SNOOP_NONE         | 31     | (R/W). No details on snoop-related information   |
|            | SNOOP_NOT_NEEDED   | 32     | (R/W). No snoop was needed to satisfy the request.   |
|            | SNOOP_MISS         | 33     | (R/W). A snoop was needed and it missed all snooped caches:<br>-For LLC Hit, ReslHitl was returned by all cores<br>-For LLC Miss, Rspl was returned by all sockets and data was returned from DRAM.  |
|            | SNOOP_HIT_NO_FWD   | 34     | (R/W). A snoop was needed and it hits in at least one snooped cache. Hit denotes a cache-line was valid before snoop effect. This includes:<br>-Snoop Hit w/ Invalidation (LLC Hit, RFO)<br>-Snoop Hit, Left Shared (LLC Hit/Miss, IFetch/Data_RD)<br>-Snoop Hit w/ Invalidation and No Forward (LLC Miss, RFO Hit S)<br>In the LLC Miss case, data is returned from DRAM. |
|            | SNOOP_HIT_WITH_FWD | 35     | (R/W). A snoop was needed and data was forwarded from a remote socket. This includes:<br>-Snoop Forward Clean, Left Shared (LLC Hit/Miss, IFetch/Data_RD/RFT).   |
|            | SNOOP_HITM         | 36     | (R/W). A snoop was needed and it HitM-ed in local or remote cache. HitM denotes a cache-line was in modified state before effect as a results of snoop. This includes:<br>-Snoop HitM w/ WB (LLC miss, IFetch/Data_RD)<br>-Snoop Forward Modified w/ Invalidation (LLC Hit/Miss, RFO)<br>-Snoop MtoS (LLC Hit, IFetch/Data_RD).  |
|            | SNOOP_NON_DRAM     | 37     | (R/W). Target was non-DRAM system address. This includes MMIO transactions.  |

**18.3.8.2.1 Off-core Response Performance Monitoring for the Intel® Xeon® Processor Scalable Family**

The following tables list the requestor and supplier information fields that apply to the Intel® Xeon® Processor Scalable Family.

- Transaction request type encoding (bits 15:0): see Table 18-43.
- Supplier information (bits 30:16): see Table 18-44.
- Snoop response information has not been changed and is the same as in (bits 37:31): see Table 18-42.

**Table 18-43. MSR\_OFFCORE\_RSP\_x Request\_Type Definition (Intel® Xeon® Processor Scalable Family)**

| Bit Name         | Offset | Description   |
|------------------|--------|---|
| DEMAND_DATA_RD   | 0      | (R/W). Counts the number of demand data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count hw or sw prefetches. |
| DEMAND_RFO       | 1      | (R/W). Counts the number of demand reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.                           |
| DEMAND_CODE_RD   | 2      | (R/W). Counts the number of demand and DCU prefetch instruction cacheline reads. Does not count L2 code read prefetches.  |
| Reserved         | 3      | Reserved.   |
| PF_L2_DATA_RD    | 4      | (R/W). Counts the number of prefetch data reads into L2.  |
| PF_L2_RFO        | 5      | (R/W). Counts the number of RFO Requests generated by the MLC prefetches to L2.   |
| Reserved         | 6      | Reserved.   |
| PF_L3_DATA_RD    | 7      | (R/W). Counts the number of MLC data read prefetches into L3.   |
| PF_L3_RFO        | 8      | (R/W). Counts the number of RFO requests generated by MLC prefetches to L3.   |
| Reserved         | 9      | Reserved.   |
| PF_L1D_AND_SW    | 10     | (R/W). Counts data cacheline reads generated by hardware L1 data cache prefetcher or software prefetch requests.  |
| STREAMING_STORES | 11     | (R/W). Counts the number of streaming store requests.   |
| Reserved         | 14:12  | Reserved.   |
| OTHER            | 15     | (R/W). Any other request that crosses IDI, including I/O.   |

Table 18-44 lists the supplier information field that applies to the Intel Xeon Processor Scalable Family (CPUID signature: 06\_55H).

**Table 18-44. MSR\_OFFCORE\_RSP\_x Supplier Info Field Definition (CPUID Signature 06\_55H)**

| Subtype       | Bit Name                  | Offset | Description   |
|---------------|---------------------------|--------|---|
| Common        | Any                       | 16     | (R/W). Catch all value for any response types.  |
| Supplier Info | SUPPLIER_NONE             | 17     | (R/W). No Supplier Information available.   |
|               | L3_HIT_M                  | 18     | (R/W). M-state initial lookup stat in L3.   |
|               | L3_HIT_E                  | 19     | (R/W). E-state  |
|               | L3_HIT_S                  | 20     | (R/W). S-state  |
|               | L3_HIT_F                  | 21     | (R/W). F-state  |
|               | Reserved                  | 25:22  | Reserved.   |
|               | L3_MISS_LOCAL_DRAM        | 26     | (R/W). L3 Miss: local home requests that missed the L3 cache and were serviced by local DRAM. |
|               | L3_MISS_REMOTE_HOP0_DRAM  | 27     | (R/W). Hop 0 Remote supplier.   |
|               | L3_MISS_REMOTE_HOP1_DRAM  | 28     | (R/W). Hop 1 Remote supplier.   |
|               | L3_MISS_REMOTE_HOP2P_DRAM | 29     | (R/W). Hop 2 or more Remote supplier.   |

## 18.4 PERFORMANCE MONITORING (INTEL® XEON™ PHI PROCESSORS)

### 18.4.1 Intel® Xeon Phi™ Processor 7200/5200/3200 Performance Monitoring

The Intel® Xeon Phi™ processor 7200/5200/3200 series are based on the Knights Landing microarchitecture. The performance monitoring capabilities are distributed between its tiles (pair of processor cores) and untile (connecting many tiles in a physical processor package). Functional details of the tiles and untile of the Knights Landing microarchitecture can be found in Chapter 16 of *Intel® 64 and IA-32 Architectures Optimization Reference Manual*.

A complete description of the tile and untile PMU programming interfaces for Intel Xeon Phi processors based on the Knights Landing microarchitecture can be found in the Technical Document section at <http://www.intel.com/content/www/us/en/processors/xeon/xeon-phi-detail.html>.

A tile contains a pair of cores attached to a shared L2 cache and is similar to those found in Intel® Atom™ processors based on the Silvermont microarchitecture. The processor provides several new capabilities on top of the Silvermont performance monitoring facilities.

The processor supports architectural performance monitoring capability with version ID 3 (see Section 18.2.3) and a host of non-architectural performance monitoring capabilities. The processor provides two general-purpose performance counters (IA32\_PMC0, IA32\_PMC1) and three fixed-function performance counters (IA32\_FIXED\_CTR0, IA32\_FIXED\_CTR1, IA32\_FIXED\_CTR2).

Non-architectural performance monitoring in the processor also uses the IA32\_PERFEVTSELx MSR to configure a set of non-architecture performance monitoring events to be counted by the corresponding general-purpose performance counter.

The bit fields within each IA32\_PERFEVTSELx MSR are defined in Figure 18-6 and described in Section 18.2.1.1 and Section 18.2.3 in the SDM. The processor supports AnyThread counting in three architectural performance monitoring events.

#### 18.4.1.1 Enhancements of Performance Monitoring in the Intel® Xeon Phi™ processor Tile

The Intel® Xeon Phi™ processor tile includes the following enhancements to the Silvermont microarchitecture.

- AnyThread support. This facility is limited to following three architectural events: Instructions Retired, Unhalted Core Cycles, Unhalted Reference Cycles using IA32\_FIXED\_CTR0-2 and Unhalted Core Cycles, Unhalted Reference Cycles using IA32\_PERFEVTSELx.
- PEBS-DLA (Processor Event-Based Sampling-Data Linear Address) fields. The processor provides memory address in addition to the Silvermont PEBS record support on select events. The PEBS recording format as reported by IA32\_PERF\_CAPABILITIES [11:8] is 2.
- Off-core response counting facility. This facility in the processor core allows software to count certain transaction responses between the processor tile to subsystems outside the tile (untile). Counting off-core response requires additional event qualification configuration facility in conjunction with IA32\_PERFEVTSELx. Two off-core response MSRs are provided to use in conjunction with specific event codes that must be specified with IA32\_PERFEVTSELx. Two cores do not share the off-core response MSRs. Knights Landing expands off-core response capability to match the processor untile changes.
- Average request latency measurement. The off-core response counting facility can be combined to use two performance counters to count the occurrences and weighted cycles of transaction requests. This facility is updated to match the processor untile changes.

##### 18.4.1.1.1 Processor Event-Based Sampling

The processor supports processor event based sampling (PEBS). PEBS is supported using IA32\_PMC0 (see also Section 17.4.9, “BTS and DS Save Area”).

PEBS uses a debug store mechanism to store a set of architectural state information for the processor. The information provides architectural state of the instruction executed after the instruction that caused the event (See Section 18.6.2.4).

The list of PEBS events supported in the processor is shown in the following table.

**Table 18-45. PEBS Performance Events for the Knights Landing Microarchitecture**

| Event Name       | Event Select | Sub-event           | UMask | Data Linear Address Support |
|------------------|--------------|---------------------|-------|-----------------------------|
| BR_INST_RETIRED  | C4H          | ALL_BRANCHES        | 00H   | No                          |
|                  |              | JCC                 | 7EH   | No                          |
|                  |              | TAKEN_JCC           | FEH   | No                          |
|                  |              | CALL                | F9H   | No                          |
|                  |              | REL_CALL            | FDH   | No                          |
|                  |              | IND_CALL            | FBH   | No                          |
|                  |              | NON_RETURN_IND      | EBH   | No                          |
|                  |              | FAR_BRANCH          | BFH   | No                          |
|                  |              | RETURN              | F7H   | No                          |
| BR_MISP_RETIRED  | C5H          | ALL_BRANCHES        | 00H   | No                          |
|                  |              | JCC                 | 7EH   | No                          |
|                  |              | TAKEN_JCC           | FEH   | No                          |
|                  |              | IND_CALL            | FBH   | No                          |
|                  |              | NON_RETURN_IND      | EBH   | No                          |
|                  |              | RETURN              | F7H   | No                          |
| MEM_UOPS_RETIRED | 04H          | L2_HIT_LOADS        | 02H   | Yes                         |
|                  |              | L2_MISS_LOADS       | 04H   | Yes                         |
|                  |              | DLTB_MISS_LOADS     | 08H   | Yes                         |
| RECYCLEQ         | 03H          | LD_BLOCK_ST_FORWARD | 01H   | Yes                         |
|                  |              | LD_SPLITS           | 08H   | Yes                         |

The PEBS record format 2 supported by processors based on the Knights Landing microarchitecture is shown in Table 18-46, and each field in the PEBS record is 64 bits long.

**Table 18-46. PEBS Record Format for the Knights Landing Microarchitecture**

| Byte Offset | Field    | Byte Offset | Field                   |
|-------------|----------|-------------|-------------------------|
| 00H         | R/EFLAGS | 60H         | R10                     |
| 08H         | R/EIP    | 68H         | R11                     |

### 18.4.1.1.2 Offcore Response Event

Event number 0B7H support offcore response monitoring using an associated configuration MSR, MSR\_OFFCORE\_RSP0 (address 1A6H) in conjunction with umask value 01H or MSR\_OFFCORE\_RSP1 (address 1A7H) in conjunction with umask value 02H. Table 18-47 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32\_PMCx.

**Table 18-47. OffCore Response Event Encoding**

| Counter | Event code | UMask | Required Off-core Response MSR  |
|---------|------------|-------|---------------------------------|
| PMC0-1  | B7H        | 01H   | MSR_OFFCORE_RSP0 (address 1A6H) |
| PMC0-1  | B7H        | 02H   | MSR_OFFCORE_RSP1 (address 1A7H) |

Some of the MSR\_OFFCORE\_RESP [0,1] register bits are not valid in this processor and their use is reserved. The layout of MSR\_OFFCORE\_RSP0 and MSR\_OFFCORE\_RSP1 registers are defined in Table 18-48. Bits 15:0 specifies the request type of a transaction request to the uncore. Bits 30:16 specifies supplier information, bits 37:31 specifies snoop response information.

Additionally, MSR\_OFFCORE\_RSP0 provides bit 38 to enable measurement of average latency of specific type of offcore transaction requests using two programmable counter simultaneously, see Section 18.5.2.3 for details.

**Table 18-48. Bit fields of the MSR\_OFFCORE\_RESP [0, 1] Registers**

| Main          | Sub-field               | Bit | Name                     | Description   |
|---------------|-------------------------|-----|--------------------------|---|
| Request Type  |                         | 0   | DEMAND_DATA_RD           | Demand cacheable data and L1 prefetch data reads.   |
|               |                         | 1   | DEMAND_RFO               | Demand cacheable data writes.   |
|               |                         | 2   | DEMAND_CODE_RD           | Demand code reads and prefetch code reads.  |
|               |                         | 3   | Reserved                 | Reserved.   |
|               |                         | 4   | Reserved                 | Reserved.   |
|               |                         | 5   | PF_L2_RFO                | L2 data RFO prefetches (includes PREFETCHW instruction).  |
|               |                         | 6   | PF_L2_CODE_RD            | L2 code HW prefetches.  |
|               |                         | 7   | PARTIAL_READS            | Partial reads (UC or WC).   |
|               |                         | 8   | PARTIAL_WRITES           | Partial writes (UC or WT or WP). Valid only for OFFCORE_RESP_1 event. Should only be used on PMC1. This bit is reserved for OFFCORE_RESP_0 event. |
|               |                         | 9   | UC_CODE_READS            | UC code reads.  |
|               |                         | 10  | BUS_LOCKS                | Bus locks and split lock requests.  |
|               |                         | 11  | FULL_STREAMING_STORES    | Full streaming stores (WC). Valid only for OFFCORE_RESP_1 event. Should only be used on PMC1. This bit is reserved for OFFCORE_RESP_0 event.      |
|               |                         | 12  | SW_PREFETCH              | Software prefetches.  |
|               |                         | 13  | PF_L1_DATA_RD            | L1 data HW prefetches.  |
|               |                         | 14  | PARTIAL_STREAMING_STORES | Partial streaming stores (WC). Valid only for OFFCORE_RESP_1 event. Should only be used on PMC1. This bit is reserved for OFFCORE_RESP_0 event.   |
|               |                         | 15  | ANY_REQUEST              | Account for any requests.   |
| Response Type | Any                     | 16  | ANY_RESPONSE             | Account for any response.   |
|               | Data Supply from Untile | 17  | NO_SUPP                  | No Supplier Details.  |
|               |                         | 18  | Reserved                 | Reserved.   |

**Table 18-48. Bit fields of the MSR\_OFFCORE\_RESP [0, 1] Registers (Contd.)**

| Main                 | Sub-field   | Bit | Name   | Description   |
|----------------------|---|-----|--|---|
|                      |   | 19  | L2_HIT_OTHER_TILE_NEAR   | Other tile L2 hit E Near.   |
|                      |   | 20  | Reserved   | Reserved.   |
|                      |   | 21  | MCDRAM_NEAR  | MCDRAM Local.   |
|                      |   | 22  | MCDRAM_FAR_OR_L2_HIT_OTHER_TILE_FAR  | MCDRAM Far or Other tile L2 hit far.  |
|                      |   | 23  | DRAM_NEAR  | DRAM Local.   |
|                      |   | 24  | DRAM_FAR   | DRAM Far.   |
|                      | Data Supply from within same tile                         | 25  | L2_HITM_THIS_TILE  | M-state.  |
|                      |   | 26  | L2_HITE_THIS_TILE  | E-state.  |
|                      |   | 27  | L2_HITS_THIS_TILE  | S-state.  |
|                      |   | 28  | L2_HITF_THIS_TILE  | F-state.  |
|                      |   | 29  | Reserved   | Reserved.   |
|                      |   | 30  | Reserved   | Reserved.   |
|                      | Snoop Info; Only Valid in case of Data Supply from Untile | 31  | SNOOP_NONE   | None of the cores were snooped.   |
|                      |   | 32  | NO_SNOOP_NEEDED  | No snoop was needed to satisfy the request.   |
|                      |   | 33  | Reserved   | Reserved.   |
|                      |   | 34  | Reserved   | Reserved.   |
|                      |   | 35  | HIT_OTHER_TILE_FWD   | Snoop request hit in the other tile with data forwarded.  |
|                      |   | 36  | HITM_OTHER_TILE  | A snoop was needed and it HitM-ed in other core's L1 cache. HitM denotes a cache-line was in modified state before effect as a result of snoop.   |
|                      |   | 37  | NON_DRAM   | Target was non-DRAM system address. This includes MMIO transactions.  |
| Outstanding requests | Weighted cycles   | 38  | OUTSTANDING (Valid only for MSR_OFFCORE_RESP0. Should only be used on PMCO. This bit is reserved for MSR_OFFCORE_RESP1). | If set, counts total number of weighted cycles of any outstanding offcore requests with data response. Valid only for OFFCORE_RESP_0 event. Should only be used on PMCO. This bit is reserved for OFFCORE_RESP_1 event. |

#### 18.4.1.1.3 Average Offcore Request Latency Measurement

Measurement of average latency of offcore transaction requests can be enabled using MSR\_OFFCORE\_RSP0.[bit 38] with the choice of request type specified in MSR\_OFFCORE\_RSP0.[bit 15:0].

Refer to Section 18.5.2.3, "Average Offcore Request Latency Measurement," for typical usage. Note that MSR\_OFFCORE\_RESPx registers are not shared between cores in Knights Landing. This allows one core to measure average latency while other core is measuring different offcore response events.

## 18.5 PERFORMANCE MONITORING (INTEL® ATOM™ PROCESSORS)

### 18.5.1 Performance Monitoring (45 nm and 32 nm Intel® Atom™ Processors)

45 nm and 32 nm Intel Atom processors report architectural performance monitoring versionID = 3 (supporting the aggregate capabilities of versionID 1, 2, and 3; see Section 18.2.3) and a host of non-architectural monitoring capabilities. These 45 nm and 32 nm Intel Atom processors provide two general-purpose performance counters (IA32\_PMC0, IA32\_PMC1) and three fixed-function performance counters (IA32\_FIXED\_CTR0, IA32\_FIXED\_CTR1, IA32\_FIXED\_CTR2).

Non-architectural performance monitoring in Intel Atom processor family uses the IA32\_PERFEVTSELx MSR to configure a set of non-architecture performance monitoring events to be counted by the corresponding general-purpose performance counter. The list of non-architectural performance monitoring events is listed in Table 19-29.

Architectural and non-architectural performance monitoring events in 45 nm and 32 nm Intel Atom processors support thread qualification using bit 21 (AnyThread) of IA32\_PERFEVTSELx MSR, i.e. if IA32\_PERFEVTSELx.AnyThread = 1, event counts include monitored conditions due to either logical processors in the same processor core.

The bit fields within each IA32\_PERFEVTSELx MSR are defined in Figure 18-6 and described in Section 18.2.1.1 and Section 18.2.3.

Valid event mask (Umask) bits are listed in Chapter 19. The UMASK field may contain sub-fields that provide the same qualifying actions like those listed in Table 18-61, Table 18-62, Table 18-63, and Table 18-64. One or more of these sub-fields may apply to specific events on an event-by-event basis. Details are listed in Table 19-29 in Chapter 19, "Performance Monitoring Events." Precise Event Based Monitoring is supported using IA32\_PMC0 (see also Section 17.4.9, "BTS and DS Save Area").

### 18.5.2 Performance Monitoring for Silvermont Microarchitecture

Intel processors based on the Silvermont microarchitecture report architectural performance monitoring versionID = 3 (see Section 18.2.3) and a host of non-architectural monitoring capabilities. Intel processors based on the Silvermont microarchitecture provide two general-purpose performance counters (IA32\_PMC0, IA32\_PMC1) and three fixed-function performance counters (IA32\_FIXED\_CTR0, IA32\_FIXED\_CTR1, IA32\_FIXED\_CTR2). Intel Atom processors based on the Airmont microarchitecture support the same performance monitoring capabilities as those based on the Silvermont microarchitecture.

Non-architectural performance monitoring in the Silvermont microarchitecture uses the IA32\_PERFEVTSELx MSR to configure a set of non-architecture performance monitoring events to be counted by the corresponding general-purpose performance counter. The list of non-architectural performance monitoring events is listed in Table 19-28.

The bit fields (except bit 21) within each IA32\_PERFEVTSELx MSR are defined in Figure 18-6 and described in Section 18.2.1.1 and Section 18.2.3. Architectural and non-architectural performance monitoring events in the Silvermont microarchitecture ignore the AnyThread qualification regardless of its setting in IA32\_PERFEVTSELx MSR.

#### 18.5.2.1 Enhancements of Performance Monitoring in the Processor Core

The notable enhancements in the monitoring of performance events in the processor core include:

- The width of counter reported by CPUID.0AH:EAX[23:16] is 40 bits.
- Off-core response counting facility. This facility in the processor core allows software to count certain transaction responses between the processor core to sub-systems outside the processor core (uncore). Counting off-core response requires additional event qualification configuration facility in conjunction with IA32\_PERFEVTSELx. Two off-core response MSRs are provided to use in conjunction with specific event codes that must be specified with IA32\_PERFEVTSELx.
- Average request latency measurement. The off-core response counting facility can be combined to use two performance counters to count the occurrences and weighted cycles of transaction requests.

### 18.5.2.1.1 Processor Event Based Sampling (PEBS)

In the Silvermont microarchitecture, the PEBS facility can be used with precise events. PEBS is supported using IA32\_PMC0 (see also Section 17.4.9).

PEBS uses a debug store mechanism to store a set of architectural state information for the processor. The information provides architectural state of the instruction executed after the instruction that caused the event (See Section 18.6.2.4).

The list of precise events supported in the Silvermont microarchitecture is shown in Table 18-49.

**Table 18-49. PEBS Performance Events for the Silvermont Microarchitecture**

| Event Name       | Event Select | Sub-event           | UMask |
|------------------|--------------|---------------------|-------|
| BR_INST_RETIRED  | C4H          | ALL_BRANCHES        | 00H   |
|                  |              | JCC                 | 7EH   |
|                  |              | TAKEN_JCC           | FEH   |
|                  |              | CALL                | F9H   |
|                  |              | REL_CALL            | FDH   |
|                  |              | IND_CALL            | FBH   |
|                  |              | NON_RETURN_IND      | EBH   |
|                  |              | FAR_BRANCH          | BFH   |
|                  |              | RETURN              | F7H   |
| BR_MISP_RETIRED  | C5H          | ALL_BRANCHES        | 00H   |
|                  |              | JCC                 | 7EH   |
|                  |              | TAKEN_JCC           | FEH   |
|                  |              | IND_CALL            | FBH   |
|                  |              | NON_RETURN_IND      | EBH   |
|                  |              | RETURN              | F7H   |
| MEM_UOPS_RETIRED | 04H          | L2_HIT_LOADS        | 02H   |
|                  |              | L2_MISS_LOADS       | 04H   |
|                  |              | DLTB_MISS_LOADS     | 08H   |
|                  |              | HITM                | 20H   |
| REHABQ           | 03H          | LD_BLOCK_ST_FORWARD | 01H   |
|                  |              | LD_SPLITS           | 08H   |

**PEBS Record Format** The PEBS record format supported by processors based on the Intel Silvermont microarchitecture is shown in Table 18-50, and each field in the PEBS record is 64 bits long.

**Table 18-50. PEBS Record Format for the Silvermont Microarchitecture**

| Byte Offset | Field    | Byte Offset | Field                   |
|-------------|----------|-------------|-------------------------|
| 00H         | R/EFLAGS | 60H         | R10                     |
| 08H         | R/EIP    | 68H         | R11                     |
| 10H         | R/EAX    | 70H         | R12                     |
| 18H         | R/EBX    | 78H         | R13                     |
| 20H         | R/ECX    | 80H         | R14                     |
| 28H         | R/EDX    | 88H         | R15                     |
| 30H         | R/ESI    | 90H         | IA32_PERF_GLOBAL_STATUS |
| 38H         | R/EDI    | 98H         | Reserved                |

Table 18-50. PEBS Record Format for the Silvermont Microarchitecture

| Byte Offset | Field | Byte Offset | Field       |
|-------------|-------|-------------|-------------|
| 40H         | R/EBP | A0H         | Reserved    |
| 48H         | R/ESP | A8H         | Reserved    |
| 50H         | R8    | B0H         | EventingRIP |

18.5.2.2 Offcore Response Event

Event number 0B7H support offcore response monitoring using an associated configuration MSR, MSR\_OFFCORE\_RSP0 (address 1A6H) in conjunction with umask value 01H or MSR\_OFFCORE\_RSP1 (address 1A7H) in conjunction with umask value 02H. Table 18-51 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32\_PMCx.

In the Silvermont microarchitecture, each MSR\_OFFCORE\_RSPx is shared by two processor cores.

Table 18-51. OffCore Response Event Encoding

| Counter | Event code | UMask | Required Off-core Response MSR  |
|---------|------------|-------|---------------------------------|
| PMCO-1  | B7H        | 01H   | MSR_OFFCORE_RSP0 (address 1A6H) |
| PMCO-1  | B7H        | 02H   | MSR_OFFCORE_RSP1 (address 1A7H) |

The layout of MSR\_OFFCORE\_RSP0 and MSR\_OFFCORE\_RSP1 are shown in Figure 18-37 and Figure 18-38. Bits 15:0 specifies the request type of a transaction request to the uncore. Bits 30:16 specifies supplier information, bits 37:31 specifies snoop response information.

Additionally, MSR\_OFFCORE\_RSP0 provides bit 38 to enable measurement of average latency of specific type of offcore transaction requests using two programmable counter simultaneously, see Section 18.5.2.3 for details.

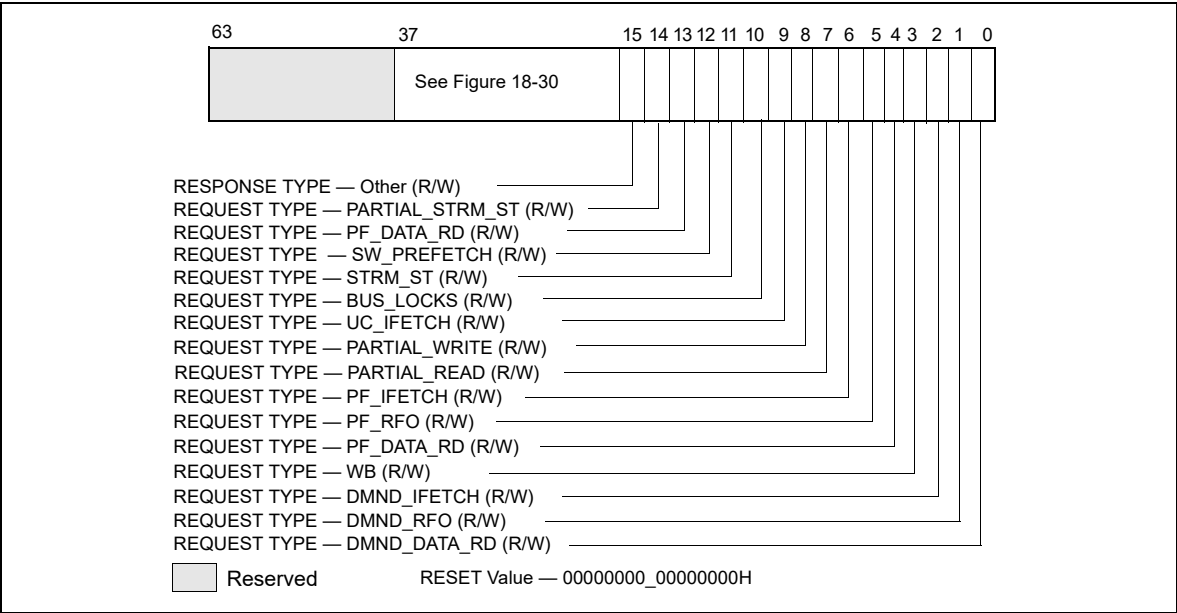

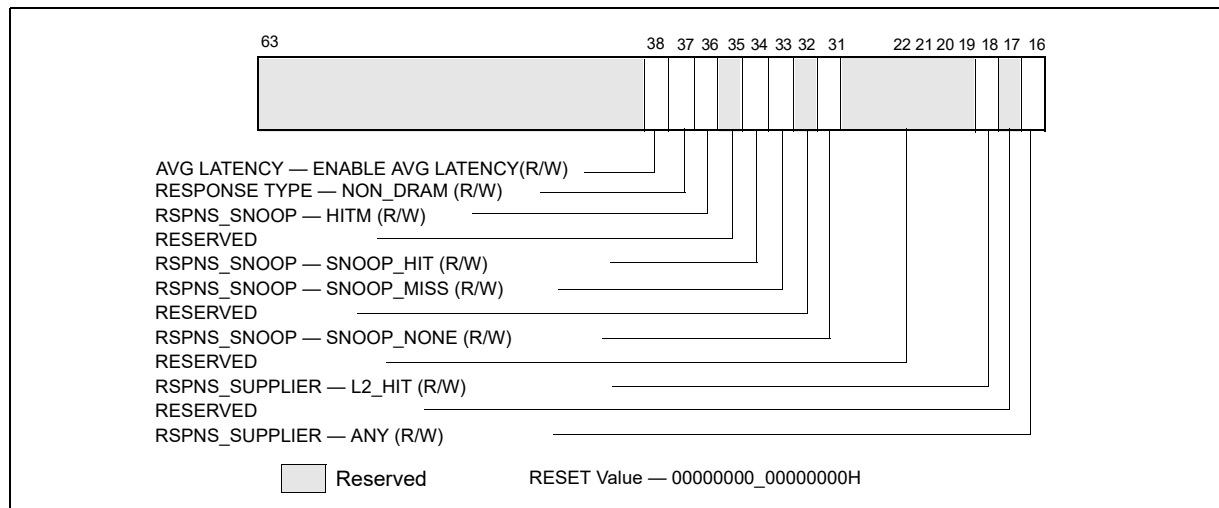

Figure 18-37. Request\_Type Fields for MSR\_OFFCORE\_RSPx

**Table 18-52. MSR\_OFFCORE\_RSPx Request\_Type Field Definition**

| Bit Name        | Offset | Description   |
|-----------------|--------|---|
| DMND_DATA_RD    | 0      | (R/W). Counts the number of demand and DCU prefetch data reads of full and partial cachelines as well as demand data page table entry cacheline reads. Does not count L2 data read prefetches or instruction fetches. |
| DMND_RFO        | 1      | (R/W). Counts the number of demand and DCU prefetch reads for ownership (RFO) requests generated by a write to data cacheline. Does not count L2 RFO prefetches.  |
| DMND_IFETCH     | 2      | (R/W). Counts the number of demand and DCU prefetch instruction cacheline reads. Does not count L2 code read prefetches.  |
| WB              | 3      | (R/W). Counts the number of writeback (modified to exclusive) transactions.   |
| PF_DATA_RD      | 4      | (R/W). Counts the number of data cacheline reads generated by L2 prefetchers.   |
| PF_RFO          | 5      | (R/W). Counts the number of RFO requests generated by L2 prefetchers.   |
| PF_IFETCH       | 6      | (R/W). Counts the number of code reads generated by L2 prefetchers.   |
| PARTIAL_READ    | 7      | (R/W). Counts the number of demand reads of partial cache lines (including UC and WC).  |
| PARTIAL_WRITE   | 8      | (R/W). Counts the number of demand RFO requests to write to partial cache lines (includes UC, WT and WP)  |
| UC_IFETCH       | 9      | (R/W). Counts the number of UC instruction fetches.   |
| BUS_LOCKS       | 10     | (R/W). Bus lock and split lock requests   |
| STRM_ST         | 11     | (R/W). Streaming store requests   |
| SW_PREFETCH     | 12     | (R/W). Counts software prefetch requests  |
| PF_DATA_RD      | 13     | (R/W). Counts DCU hardware prefetcher data read requests  |
| PARTIAL_STRM_ST | 14     | (R/W). Streaming store requests   |
| ANY             | 15     | (R/W). Any request that crosses IDI, including I/O.   |

**Figure 18-38. Response\_Supplier and Snoop Info Fields for MSR\_OFFCORE\_RSPx**

To properly program this extra register, software must set at least one request type bit (Table 18-52) and a valid response type pattern (Table 18-53, Table 18-54). Otherwise, the event count reported will be zero. It is permissible and useful to set multiple request and response type bits in order to obtain various classes of off-core response events. Although MSR\_OFFCORE\_RSPx allow an agent software to program numerous combinations that meet the above guideline, not all combinations produce meaningful data.

**Table 18-53. MSR\_OFFCORE\_RSP\_x Response Supplier Info Field Definition**

| Subtype       | Bit Name     | Offset | Description   |
|---------------|--------------|--------|---|
| Common        | ANY_RESPONSE | 16     | (R/W). Catch all value for any response types.        |
| Supplier Info | Reserved     | 17     | Reserved  |
|               | L2_HIT       | 18     | (R/W). Cache reference hit L2 in either M/E/S states. |
|               | Reserved     | 30:19  | Reserved  |

To specify a complete offcore response filter, software must properly program bits in the request and response type fields. A valid request type must have at least one bit set in the non-reserved bits of 15:0. A valid response type must be a non-zero value of the following expression:

ANY | [(‘OR’ of Supplier Info Bits) & (‘OR’ of Snoop Info Bits)]

If “ANY” bit is set, the supplier and snoop info bits are ignored.

**Table 18-54. MSR\_OFFCORE\_RSPx Snoop Info Field Definition**

| Subtype    | Bit Name    | Offset | Description  |
|------------|-------------|--------|--|
| Snoop Info | SNP_NONE    | 31     | (R/W). No details on snoop-related information.  |
|            | Reserved    | 32     | Reserved   |
|            | SNOOP_MISS  | 33     | (R/W). Counts the number of snoop misses when L2 misses.   |
|            | SNOOP_HIT   | 34     | (R/W). Counts the number of snoops hit in the other module where no modified copies were found.  |
|            | Reserved    | 35     | Reserved   |
|            | HITM        | 36     | (R/W). Counts the number of snoops hit in the other module where modified copies were found in other core’s L1 cache.  |
|            | NON_DRAM    | 37     | (R/W). Target was non-DRAM system address. This includes MMIO transactions.  |
|            | AVG_LATENCY | 38     | (R/W). Enable average latency measurement by counting weighted cycles of outstanding offcore requests of the request type specified in bits 15:0 and any response (bits 37:16 cleared to 0).<br><br>This bit is available in MSR_OFFCORE_RESP0. The weighted cycles is accumulated in the specified programmable counter IA32_PMCx and the occurrence of specified requests are counted in the other programmable counter. |

### 18.5.2.3 Average Offcore Request Latency Measurement

Average latency for offcore transactions can be determined by using both MSR\_OFFCORE\_RSP registers. Using two performance monitoring counters, program the two OFFCORE\_RESPONSE event encodings into the corresponding IA32\_PERFVTSELx MSRs. Count the weighted cycles via MSR\_OFFCORE\_RSP0 by programming a request type in MSR\_OFFCORE\_RSP0.[15:0] and setting MSR\_OFFCORE\_RSP0.OUTSTANDING[38] to 1, while setting the remaining bits to 0. Count the number of requests via MSR\_OFFCORE\_RSP1 by programming the same request type from MSR\_OFFCORE\_RSP0 into MSR\_OFFCORE\_RSP1[bit 15:0], and setting MSR\_OFFCORE\_RSP1.ANY\_RESPONSE[16] = 1, while setting the remaining bits to 0. The average latency can be

obtained by dividing the value of the IA32\_PMCx register that counted weight cycles by the register that counted requests.

### 18.5.3 Performance Monitoring for Goldmont Microarchitecture

Intel Atom processors based on the Goldmont microarchitecture report architectural performance monitoring versionID = 4 (see Section 18.2.4) and support non-architectural monitoring capabilities described in this section.

Architectural performance monitoring version 4 capabilities are described in Section 18.2.4.

The bit fields (except bit 21) within each IA32\_PERFVTSELx MSR are defined in Figure 18-6 and described in Section 18.2.1.1 and Section 18.2.3. The Goldmont microarchitecture does not support Hyper-Threading and thus architectural and non-architectural performance monitoring events ignore the AnyThread qualification regardless of its setting in the IA32\_PERFVTSELx MSR. However, Goldmont does not set the AnyThread deprecation bit (CPUID.0AH:EDX[15]).

The core PMU's capability is similar to that of the Silvermont microarchitecture described in Section 18.5.2, with some differences and enhancements summarized in Table 18-55.

**Table 18-55. Core PMU Comparison Between the Goldmont and Silvermont Microarchitectures**

| Box  | The Goldmont microarchitecture  | The Silvermont microarchitecture  | Comment  |
|--|---|---|--|
| # of Fixed counters per core   | 3   | 3   | Use CPUID to enumerate # of counters.  |
| # of general-purpose counters per core                               | 4   | 2   |  |
| Counter width (R,W)  | R:48, W: 32/48  | R:40, W:32  | See Section 18.2.2.  |
| Architectural Performance Monitoring version ID                      | 4   | 3   | Use CPUID to enumerate # of counters.  |

| PEBS EventingIP             | Yes  | Yes   |                             |
| Off-core Response Event     | MSR 1A6H and 1A7H, each core has its own register.                             | MSR 1A6H and 1A7H, shared by a pair of cores. | Nehalem supports 1A6H only. |

### 18.5.3.1 Processor Event Based Sampling (PEBS)

Processor event based sampling (PEBS) on the Goldmont microarchitecture is enhanced over prior generations with respect to sampling support of precise events and non-precise events. In the Goldmont microarchitecture, PEBS is supported using IA32\_PMC0 for all events (see Section 17.4.9).

PEBS uses a debug store mechanism to store a set of architectural state information for the processor at the time the sample was generated.

Precise events work the same way on Goldmont microarchitecture as on the Silvermont microarchitecture. The record will be generated after an instruction that causes the event when the counter is already overflowed and will capture the architectural state at this point (see Section 18.6.2.4 and Section 17.4.9). The eventingIP in the record will indicate the instruction that caused the event. The list of precise events supported in the Goldmont microarchitecture is shown in Table 18-56.

In the Goldmont microarchitecture, the PEBS facility also supports the use of non-precise events to record processor state information into PEBS records with the same format as with precise events.

However, a non-precise event may not be attributable to a particular retired instruction or the time of instruction execution. When the counter overflows, a PEBS record will be generated at the next opportunity. Consider the event ICACHE.HIT. When the counter overflows, the processor is fetching future instructions. The PEBS record will be generated at the next opportunity and capture the state at the processor's current retirement point. It is likely that the instruction fetch that caused the event to increment was beyond that current retirement point. Other examples of non-precise events are CPU\_CLK\_UNHALTED.CORE\_P and HARDWARE\_INTERRUPTS.RECEIVED. CPU\_CLK\_UNHALTED.CORE\_P will increment each cycle that the processor is awake. When the counter overflows, there may be many instructions in various stages of execution. Additionally, zero, one or multiple instructions may be retired the cycle that the counter overflows. HARDWARE\_INTERRUPTS.RECEIVED increments independent of any instructions being executed. For all non-precise events, the PEBS record will be generated at the next opportunity, after the counter has overflowed. The PEBS facility thus allows for identification of the instructions which were executing when the event overflowed.

After generating a record for a non-precise event, the PEBS facility reloads the counter and resumes execution, just as is done for precise events. Unlike interrupt-based sampling, which requires an interrupt service routine to collect the sample and reload the counter, the PEBS facility can collect samples even when interrupts are masked and without using NMI. Since a PEBS record is generated immediately when a counter for a non-precise event is enabled, it may also be generated after an overflow is set by an MSR write to IA32\_PERF\_GLOBAL\_STATUS\_SET.

**Table 18-56. Precise Events Supported by the Goldmont Microarchitecture**

| Event Name            | Event Select | Sub-event        | UMask |
|-----------------------|--------------|------------------|-------|
| LD_BLOCKS             | 03H          | DATA_UNKNOWN     | 01H   |
|                       |              | STORE_FORWARD    | 02H   |
|                       |              | 4K_ALIAS         | 04H   |
|                       |              | UTLB_MISS        | 08H   |
|                       |              | ALL_BLOCK        | 10H   |
| MISALIGN_MEM_REF      | 13H          | LOAD_PAGE_SPLIT  | 02H   |
|                       |              | STORE_PAGE_SPLIT | 04H   |

|                       |              | LD_SPLITSMS      | 01H   |
| BR_INST_RETIRED       | C4H          | ALL_BRANCHES     | 00H   |
|                       |              | JCC              | 7EH   |
|                       |              | TAKEN_JCC        | FEH   |
|                       |              | CALL             | F9H   |
|                       |              | REL_CALL         | FDH   |
|                       |              | IND_CALL         | FBH   |
|                       |              | NON_RETURN_IND   | EBH   |
|                       |              | FAR_BRANCH       | BFH   |
|                       |              | RETURN           | F7H   |
| BR_MISP_RETIRED       | C5H          | ALL_BRANCHES     | 00H   |
|                       |              | JCC              | 7EH   |
|                       |              | TAKEN_JCC        | FEH   |
|                       |              | IND_CALL         | FBH   |
|                       |              | NON_RETURN_IND   | EBH   |
|                       |              | RETURN           | F7H   |
| MEM_UOPS_RETIRED      | D0H          | ALL_LOADS        | 81H   |
|                       |              | ALL_STORES       | 82H   |
|                       |              | ALL              | 83H   |
|                       |              | DLTB_MISS_LOADS  | 11H   |
|                       |              | DLTB_MISS_STORES | 12H   |
|                       |              | DLTB_MISS        | 13H   |
| MEM_LOAD_UOPS_RETIRED | D1H          | L1_HIT           | 01H   |
|                       |              | L2_HIT           | 02H   |
|                       |              | L1_MISS          | 08H   |
|                       |              | L2_MISS          | 10H   |
|                       |              | HITM             | 20H   |
|                       |              | WCB_HIT          | 40H   |
|                       |              | DRAM_HIT         | 80H   |

The PEBS record format supported by processors based on the Intel Goldmont microarchitecture is shown in Table 18-57, and each field in the PEBS record is 64 bits long.

**Table 18-57. PEBS Record Format for the Goldmont Microarchitecture**

| Byte Offset | Field    | Byte Offset | Field               |
|-------------|----------|-------------|---------------------|
| 00H         | R/EFLAGS | 68H         | R11                 |
| 08H         | R/EIP    | 70H         | R12                 |
| 10H         | R/EAX    | 78H         | R13                 |
| 18H         | R/EBX    | 80H         | R14                 |
| 20H         | R/ECX    | 88H         | R15                 |
| 28H         | R/EDX    | 90H         | Applicable Counters |
| 30H         | R/ESI    | 98H         | Data Linear Address |
| 38H         | R/EDI    | A0H         | Reserved            |
| 40H         | R/EBP    | A8H         | Reserved            |
| 48H         | R/ESP    | B0H         | EventingRIP         |
| 50H         | R8       | B8H         | Reserved            |
| 58H         | R9       | C0H         | TSC                 |
| 60H         | R10      |             |                     |

On Goldmont microarchitecture, all 64 bits of architectural registers are written into the PEBS record regardless of processor mode.

With PEBS record format encoding 0011b, offset 90H reports the "Applicable Counter" field, which indicates which counters actually requested generating a PEBS record. This allows software to correlate the PEBS record entry properly with the instruction that caused the event even when multiple counters are configured to record PEBS records and multiple bits are set in the field. Additionally, offset C0H captures a snapshot of the TSC that provides a time line annotation for each PEBS record entry.

#### 18.5.3.1.1 PEBS Data Linear Address Profiling

Goldmont supports the Data Linear Address field introduced in Haswell. It does not support the Data Source Encoding or Latency Value fields that are also part of Data Address Profiling; those fields are present in the record but are reserved.

For Goldmont microarchitecture, the Data Linear Address field will record the linear address of memory accesses in the previous instruction (e.g. the one that triggered a precise event that caused the PEBS record to be generated). Goldmont microarchitecture may record a Data Linear Address for the instruction that caused the event even for events not related to memory accesses. This may differ from other microarchitectures.

#### 18.5.3.1.2 Reduced Skid PEBS

For precise events, upon triggering a PEBS assist, there will be a finite delay between the time the counter overflows and when the microcode starts to carry out its data collection obligations. The Reduced Skid mechanism mitigates the "skid" problem by providing an early indication of when the counter is about to overflow, allowing the machine to more precisely trap on the instruction that actually caused the counter overflow thus greatly reducing skid.

This mechanism is a superset of the PDIR mechanism available in the Sandy Bridge microarchitecture. See Section 18.3.4.4.4

In the Goldmont microarchitecture, the mechanism applies to all precise events including, INST\_RETIRE, except for UOPS\_RETIRE. However, the Reduced Skid mechanism is disabled for any counter when the INV, ANY, E, or CMASK fields are set.

For the Reduced Skid mechanism to operate correctly, the performance monitoring counters should not be reconfigured or modified when they are running with PEBS enabled. The counters need to be disabled (e.g. via

IA32\_PERF\_GLOBAL\_CTRL MSR) before changes to the configuration (e.g. what event is specified in IA32\_PERFEVTSELx or whether PEBS is enabled for that counter via IA32\_PEBS\_ENABLE) or counter value (MSR write to IA32\_PMCx and IA32\_A\_PMCx).

### 18.5.3.1.3 Enhancements to IA32\_PERF\_GLOBAL\_STATUS.OvfDSBuffer[62]

In addition to IA32\_PERF\_GLOBAL\_STATUS.OvfDSBuffer[62] being set when PEBS\_Index reaches the PEBS\_Interrupt\_Threshold, the bit is also set when PEBS\_Index is out of bounds. That is, the bit will be set when PEBS\_Index < PEBS\_Buffer\_Base or PEBS\_Index > PEBS\_Absolute\_Maximum. Note that when an out of bound condition is encountered, the overflow bits in IA32\_PERF\_GLOBAL\_STATUS will be cleared according to Applicable Counters, however the IA32\_PMCx values will not be reloaded with the Reset values stored in the DS\_AREA.

### 18.5.3.2 Offcore Response Event

Event number 0B7H support offcore response monitoring using an associated configuration MSR, MSR\_OFFCORE\_RSP0 (address 1A6H) in conjunction with umask value 01H or MSR\_OFFCORE\_RSP1 (address 1A7H) in conjunction with umask value 02H. Table 18-51 lists the event code, mask value and additional off-core configuration MSR that must be programmed to count off-core response events using IA32\_PMCx.

The Goldmont microarchitecture provides unique pairs of MSR\_OFFCORE\_RSPx registers per core.

The layout of MSR\_OFFCORE\_RSP0 and MSR\_OFFCORE\_RSP1 are organized as follows:

- Bits 15:0 specifies the request type of a transaction request to the uncure. This is described in Table 18-58.
- Bits 30:16 specifies common supplier information or an L2 Hit, and is described in Table 18-53.
- If L2 misses, then Bits 37:31 can be used to specify snoop response information and is described in Table 18-59.
- For outstanding requests, bit 38 can enable measurement of average latency of specific type of offcore transaction requests using two programmable counter simultaneously; see Section 18.5.2.3 for details.

**Table 18-58. MSR\_OFFCORE\_RSPx Request\_Type Field Definition**

| Bit Name                 | Offset | Description  |
|--------------------------|--------|--|
| DEMAND_DATA_RD           | 0      | (R/W) Counts cacheline read requests due to demand reads (excludes prefetches).  |
| DEMAND_RFO               | 1      | (R/W) Counts cacheline read for ownership (RFO) requests due to demand writes (excludes prefetches).                         |
| DEMAND_CODE_RD           | 2      | (R/W) Counts demand instruction cacheline and I-side prefetch requests that miss the instruction cache.                      |
| COREWB                   | 3      | (R/W) Counts writeback transactions caused by L1 or L2 cache evictions.  |
| PF_L2_DATA_RD            | 4      | (R/W) Counts data cacheline reads generated by hardware L2 cache prefetcher.   |
| PF_L2_RFO                | 5      | (R/W) Counts reads for ownership (RFO) requests generated by L2 prefetcher.  |
| Reserved                 | 6      | Reserved.  |
| PARTIAL_READS            | 7      | (R/W) Counts demand data partial reads, including data in uncacheable (UC) or uncacheable (WC) write combining memory types. |
| PARTIAL_WRITES           | 8      | (R/W) Counts partial writes, including uncacheable (UC), write through (WT) and write protected (WP) memory type writes.     |
| UC_CODE_READS            | 9      | (R/W) Counts code reads in uncacheable (UC) memory region.   |
| BUS_LOCKS                | 10     | (R/W) Counts bus lock and split lock requests.   |
| FULL_STREAMING_STORES    | 11     | (R/W) Counts full cacheline writes due to streaming stores.  |
| SW_PREFETCH              | 12     | (R/W) Counts cacheline requests due to software prefetch instructions.   |
| PF_L1_DATA_RD            | 13     | (R/W) Counts data cacheline reads generated by hardware L1 data cache prefetcher.  |
| PARTIAL_STREAMING_STORES | 14     | (R/W) Counts partial cacheline writes due to streaming stores.   |

**Table 18-58. MSR\_OFFCORE\_RSPx Request\_Type Field Definition (Contd.)**

| Bit Name    | Offset | Description                                    |
|-------------|--------|--|
| ANY_REQUEST | 15     | (R/W) Counts requests to the uncore subsystem. |

To properly program this extra register, software must set at least one request type bit (Table 18-52) and a valid response type pattern (either Table 18-53 or Table 18-59). Otherwise, the event count reported will be zero. It is permissible and useful to set multiple request and response type bits in order to obtain various classes of off-core response events. Although MSR\_OFFCORE\_RSPx allow an agent software to program numerous combinations that meet the above guideline, not all combinations produce meaningful data.

**Table 18-59. MSR\_OFFCORE\_RSPx For L2 Miss and Outstanding Requests**

| Subtype                           | Bit Name                              | Offset | Description  |
|-----------------------------------|---------------------------------------|--------|--|
| L2_MISS<br>(Snoop Info)           | Reserved                              | 32:31  | Reserved   |
|                                   | L2_MISS.SNOOP_MISS_OR_NO_SNOOP_NEEDED | 33     | (R/W). A true miss to this module, for which a snoop request missed the other module or no snoop was performed/needed.   |
|                                   | L2_MISS.HIT_OTHER_CORE_NO_FWD         | 34     | (R/W) A snoop hit in the other processor module, but no data forwarding is required.   |
|                                   | Reserved                              | 35     | Reserved   |
|                                   | L2_MISS.HITM_OTHER_CORE               | 36     | (R/W) Counts the number of snoops hit in the other module or other core's L1 where modified copies were found.   |
|                                   | L2_MISS.NON_DRAM                      | 37     | (R/W) Target was a non-DRAM system address. This includes MMIO transactions.   |
| Outstanding requests <sup>1</sup> | OUTSTANDING                           | 38     | (R/W) Counts weighted cycles of outstanding offcore requests of the request type specified in bits 15:0, from the time the XQ receives the request and any response is received. Bits 37:16 must be set to 0. This bit is only available in MSR_OFFCORE_RESP0. |

**NOTES:**

1. See Section 18.5.2.3, "Average Offcore Request Latency Measurement" for details on how to use this bit to extract average latency.

To specify a complete offcore response filter, software must properly program bits in the request and response type fields. A valid request type must have at least one bit set in the non-reserved bits of 15:0. A valid response type must be a non-zero value of the following expression:

[ANY 'OR' (L2 Hit) ] 'XOR' ( Snoop Info Bits) 'XOR' (Avg Latency)

**18.5.3.3 Average Offcore Request Latency Measurement**

In Goldmont microarchitecture, measurement of average latency of offcore transaction requests is the same as described in Section 18.5.2.3.

**18.5.4 Performance Monitoring for Goldmont Plus Microarchitecture**

Intel Atom processors based on the Goldmont Plus microarchitecture report architectural performance monitoring versionID = 4 and support non-architectural monitoring capabilities described in this section.

Architectural performance monitoring version 4 capabilities are described in Section 18.2.4.

Goldmont Plus performance monitoring capabilities are similar to Goldmont capabilities. The differences are in specific events and in which counters support PEBS. Goldmont Plus introduces the ability for fixed performance monitoring counters to generate PEBS records.

Goldmont Plus will set the AnyThread deprecation CPUID bit (CPUID.0AH:EDX[15]) to indicate that the Any-Thread bits in IA32\_PERFVTSELx and IA32\_FIXED\_CTR\_CTRL have no effect.

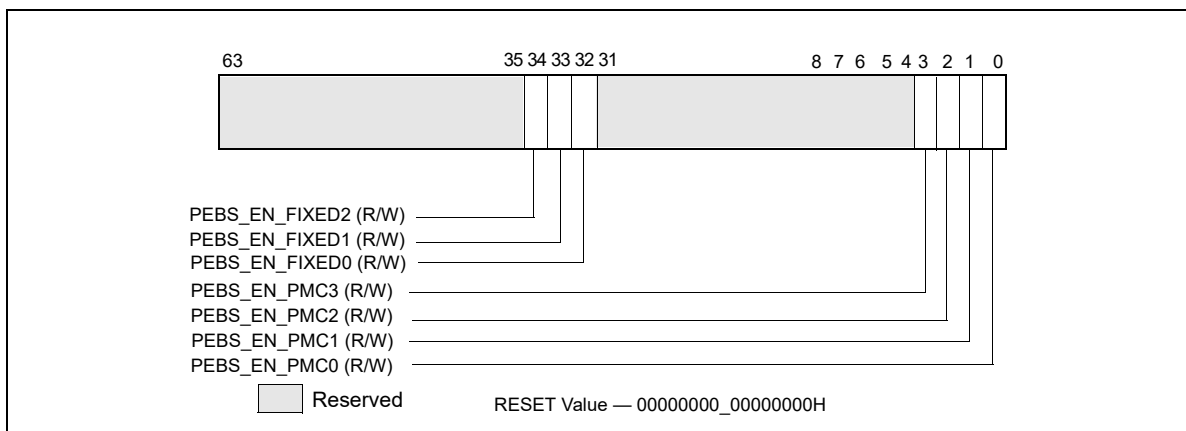

The core PMU's capability is similar to that of the Goldmont microarchitecture described in Section 18.6.3, with some differences and enhancements summarized in Table 18-60.

**Table 18-60. Core PMU Comparison Between the Goldmont Plus and Goldmont Microarchitectures**

| Box   | Goldmont Plus Microarchitecture   | Goldmont Microarchitecture   | Comment                                      |
|---|---|--|--|
| # of Fixed counters per core                    | 3   | 3  | No change.                                   |
| # of general-purpose counters per core          | 4   | 4  | No change.                                   |
| Counter width (R,W)                             | R:48, W: 32/48  | R:48, W: 32/48   | No change.                                   |
| Architectural Performance Monitoring version ID | 4   | 4  | No change.                                   |
| Processor Event Based Sampling (PEBS) Events    | All General-Purpose and Fixed counters. Each General-Purpose counter supports all events (precise and non-precise). | General-Purpose Counter 0 only. Supports all events (precise and non-precise). Precise events are listed in Table 18-56. | Goldmont Plus supports PEBS on all counters. |
| PEBS record format encoding                     | 0011b   | 0011b  | No change.                                   |

#### 18.5.4.1 Extended PEBS

The Extended PEBS feature, introduced in Goldmont Plus microarchitecture, supports PEBS (Processor Event Based Sampling) on a fixed-function performance counters as well as all four general purpose counters (PMC0-3). PEBS can be enabled for the four general purpose counters using PEBS\_EN\_PMCi bits of IA32\_PEBS\_ENABLE (i = 0, 1, 2, 3). PEBS can be enabled for the 3 fixed function counters using the PEBS\_EN\_FIXEDi bits of IA32\_PEBS\_ENABLE (i = 0, 1, 2).

**Figure 18-39. Layout of IA32\_PEBS\_ENABLE MSR**

Similar to Goldmont microarchitecture, Goldmont Plus microarchitecture processors can generate PEBS record events on both precise as well as non-precise events.

A PEBS record due to a precise event will be generated after an instruction that causes the event when the counter has already overflowed. A PEBS record due to a non-precise event will occur at the next opportunity after the counter has overflowed, including immediately after an overflow is set by an MSR write.

IA32\_FIXED\_CTR0 counts instructions retired and is a precise event. IA32\_FIXED\_CTR1 counts unhalting core cycles and is a non-precise event. IA32\_FIXED\_CTR2 counts unhalting reference cycles and is a non-precise event.

The Applicable Counter field at offset 90H of the PEBS record indicates which counters caused the PEBS record to be generated. It is in the same format as the enable bits for each counter in IA32\_PEBS\_ENABLE. As an example,

- an Applicable Counter field with bits 2 and 32 set would indicate that both general purpose counter 2 and fixed function counter 0 generated the PEBS record.
- To properly use PEBS for the additional counters, software will need to set up the counter reset values in PEBS portion of the DS\_BUFFER\_MANAGEMENT\_AREA data structure that is indicated by the IA32\_DS\_AREA register. The layout of the DS\_BUFFER\_MANAGEMENT\_AREA for Goldmont Plus is shown in Figure 18-40. When a counter generates a PEBS records, the appropriate counter reset values will be loaded into that counter. In the above example where general purpose counter 2 and fixed function counter 0 generated the PEBS record, general purpose counter 2 would be reloaded with the value contained in PEBS GP Counter 2 Reset (offset 50H) and fixed function counter 0 would be reloaded with the value contained in PEBS Fixed Counter 0 Reset (offset 80H).

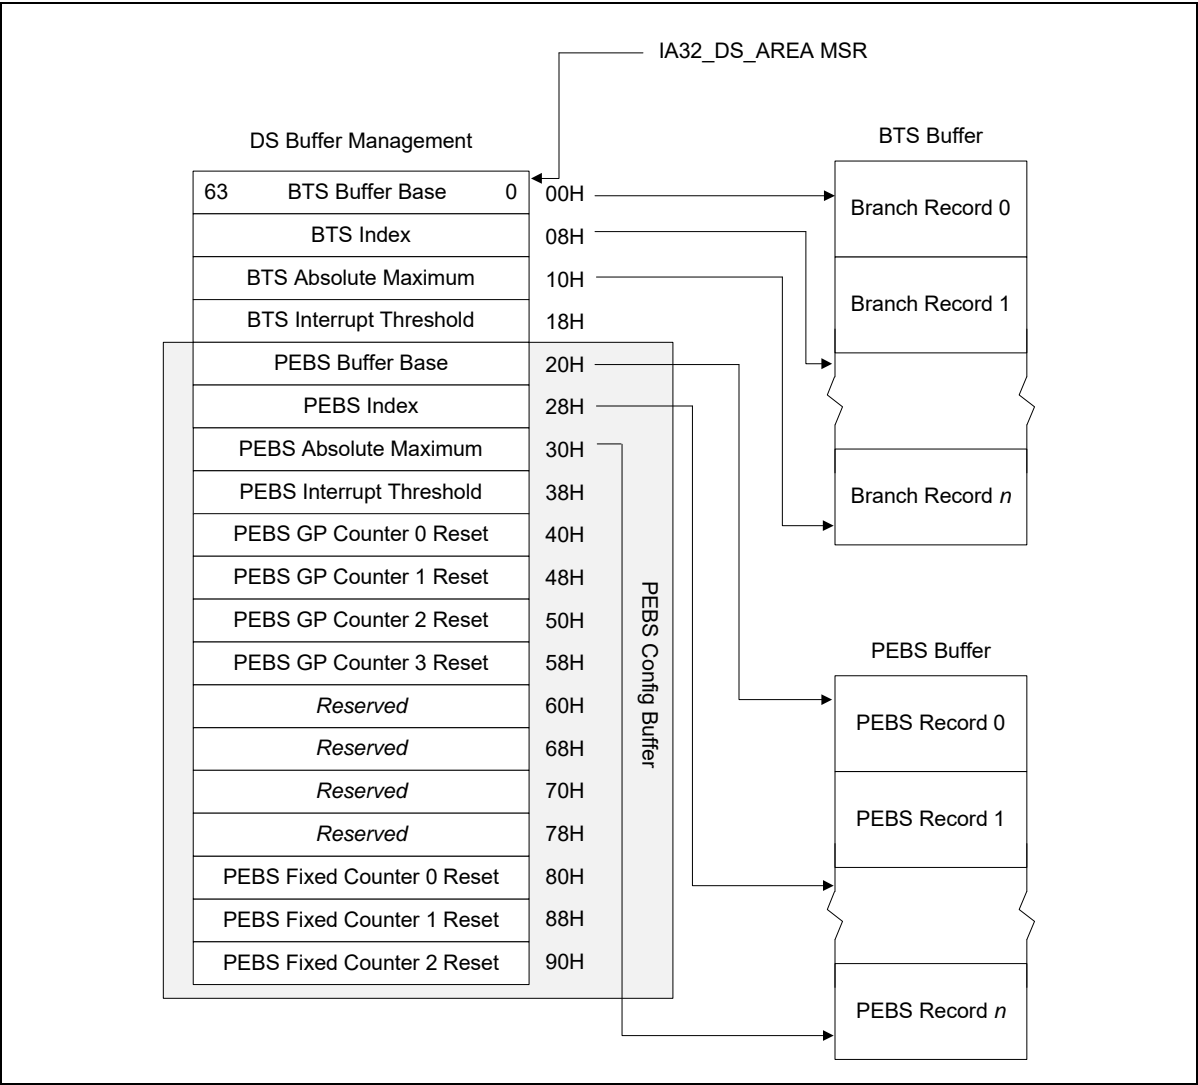

Figure 18-40. PEBS Programming Environment

### 18.5.4.2 Reduced Skid PEBS

Goldmont Plus microarchitecture processors supports the Reduced Skid PEBS feature described in Section 18.5.3.1.2 on the IA32\_PMC0 counter. Although Goldmont Plus adds support for generating PEBS records for precise events on the other general-purpose and fixed-function performance counters, those counters do not support the Reduced Skid PEBS feature.

## 18.6 PERFORMANCE MONITORING (LEGACY INTEL PROCESSORS)

### 18.6.1 Performance Monitoring (Intel® Core™ Solo and Intel® Core™ Duo Processors)

In Intel Core Solo and Intel Core Duo processors, non-architectural performance monitoring events are programmed using the same facilities (see Figure 18-1) used for architectural performance events.

Non-architectural performance events use event select values that are model-specific. Event mask (Umask) values are also specific to event logic units. Some microarchitectural conditions detectable by a Umask value may have specificity related to processor topology (see Section 8.6, “Detecting Hardware Multi-Threading Support and Topology,” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*). As a result, the unit mask field (for example, IA32\_PERFEVTSELx[bits 15:8]) may contain sub-fields that specify topology information of processor cores.

The sub-field layout within the Umask field may support two-bit encoding that qualifies the relationship between a microarchitectural condition and the originating core. This data is shown in Table 18-61. The two-bit encoding for core-specificity is only supported for a subset of Umask values (see Chapter 19, “Performance Monitoring Events”) and for Intel Core Duo processors. Such events are referred to as core-specific events.

**Table 18-61. Core Specificity Encoding within a Non-Architectural Umask**

| IA32_PERFEVTSELx MSRs |             |
|-----------------------|-------------|
| Bit 15:14 Encoding    | Description |
| 11B                   | All cores   |
| 10B                   | Reserved    |
| 01B                   | This core   |
| 00B                   | Reserved    |

Some microarchitectural conditions allow detection specificity only at the boundary of physical processors. Some bus events belong to this category, providing specificity between the originating physical processor (a bus agent) versus other agents on the bus. Sub-field encoding for agent specificity is shown in Table 18-62.

**Table 18-62. Agent Specificity Encoding within a Non-Architectural Umask**

| IA32_PERFEVTSELx MSRs |                    |
|-----------------------|--------------------|
| Bit 13 Encoding       | Description        |
| 0                     | This agent         |
| 1                     | Include all agents |

Some microarchitectural conditions are detectable only from the originating core. In such cases, unit mask does not support core-specificity or agent-specificity encodings. These are referred to as core-only conditions.

Some microarchitectural conditions allow detection specificity that includes or excludes the action of hardware prefetches. A two-bit encoding may be supported to qualify hardware prefetch actions. Typically, this applies only to some L2 or bus events. The sub-field encoding for hardware prefetch qualification is shown in Table 18-63.

**Table 18-63. HW Prefetch Qualification Encoding within a Non-Architectural Umask**

| IA32_PERFEVTSELx MSRs |                           |
|-----------------------|---------------------------|
| Bit 13:12 Encoding    | Description               |
| 11B                   | All inclusive             |
| 10B                   | Reserved                  |
| 01B                   | Hardware prefetch only    |
| 00B                   | Exclude hardware prefetch |

Some performance events may (a) support none of the three event-specific qualification encodings (b) may support core-specificity and agent specificity simultaneously (c) or may support core-specificity and hardware prefetch qualification simultaneously. Agent-specificity and hardware prefetch qualification are mutually exclusive.

In addition, some L2 events permit qualifications that distinguish cache coherent states. The sub-field definition for cache coherency state qualification is shown in Table 18-64. If no bits in the MESI qualification sub-field are set for an event that requires setting MESI qualification bits, the event count will not increment.

**Table 18-64. MESI Qualification Definitions within a Non-Architectural Umask**

| IA32_PERFEVTSELx MSRs |                        |
|-----------------------|------------------------|
| Bit Position 11:8     | Description            |
| Bit 11                | Counts modified state  |
| Bit 10                | Counts exclusive state |
| Bit 9                 | Counts shared state    |
| Bit 8                 | Counts Invalid state   |

## 18.6.2 Performance Monitoring (Processors Based on Intel® Core™ Microarchitecture)

In addition to architectural performance monitoring, processors based on the Intel Core microarchitecture support non-architectural performance monitoring events.

Architectural performance events can be collected using general-purpose performance counters. Non-architectural performance events can be collected using general-purpose performance counters (coupled with two IA32\_PERFEVTSELx MSRs for detailed event configurations), or fixed-function performance counters (see Section 18.6.2.1). IA32\_PERFEVTSELx MSRs are architectural; their layout is shown in Figure 18-1. Starting with Intel Core 2 processor T 7700, fixed-function performance counters and associated counter control and status MSR becomes part of architectural performance monitoring version 2 facilities (see also Section 18.2.2).

Non-architectural performance events in processors based on Intel Core microarchitecture use event select values that are model-specific. Valid event mask (Umask) bits are listed in Chapter 19. The UMASK field may contain sub-fields identical to those listed in Table 18-61, Table 18-62, Table 18-63, and Table 18-64. One or more of these sub-fields may apply to specific events on an event-by-event basis. Details are listed in Table 19-25 in Chapter 19, "Performance Monitoring Events."

In addition, the UMASK field may also contain a sub-field that allows detection specificity related to snoop responses. Bits of the snoop response qualification sub-field are defined in Table 18-65.

**Table 18-65. Bus Snoop Qualification Definitions within a Non-Architectural Umask**

| IA32_PERFEVTSELx MSRs |               |
|-----------------------|---------------|
| Bit Position 11:8     | Description   |
| Bit 11                | HITM response |
| Bit 10                | Reserved      |

**Table 18-65. Bus Snoop Qualification Definitions within a Non-Architectural Umask**

| IA32_PERFEVTSELx MSRs |                |
|-----------------------|----------------|
| Bit Position 11:8     | Description    |
| Bit 9                 | HIT response   |
| Bit 8                 | CLEAN response |

There are also non-architectural events that support qualification of different types of snoop operation. The corresponding bit field for snoop type qualification are listed in Table 18-66.

**Table 18-66. Snoop Type Qualification Definitions within a Non-Architectural Umask**

| IA32_PERFEVTSELx MSRs |              |
|-----------------------|--------------|
| Bit Position 9:8      | Description  |
| Bit 9                 | CMP2I snoops |
| Bit 8                 | CMP2S snoops |

No more than one sub-field of MESI, snoop response, and snoop type qualification sub-fields can be supported in a performance event.

#### NOTE

Software must write known values to the performance counters prior to enabling the counters. The content of general-purpose counters and fixed-function counters are undefined after INIT or RESET.

### 18.6.2.1 Fixed-function Performance Counters

Processors based on Intel Core microarchitecture provide three fixed-function performance counters. Bits beyond the width of the fixed counter are reserved and must be written as zeros. Model-specific fixed-function performance counters on processors that support Architectural Perfmon version 1 are 40 bits wide.

Each of the fixed-function counter is dedicated to count a pre-defined performance monitoring events. See Table 18-2 for details of the PMC addresses and what these events count.

Programming the fixed-function performance counters does not involve any of the IA32\_PERFEVTSELx MSRs, and does not require specifying any event masks. Instead, the MSR MSR\_PERF\_FIXED\_CTR\_CTRL provides multiple sets of 4-bit fields; each 4-bit field controls the operation of a fixed-function performance counter (PMC). See Figures 18-41. Two sub-fields are defined for each control. See Figure 18-41; bit fields are:

- **Enable field (low 2 bits in each 4-bit control)** — When bit 0 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment when the target condition associated with the architecture performance event occurs at ring 0.

When bit 1 is set, performance counting is enabled in the corresponding fixed-function performance counter to increment when the target condition associated with the architecture performance event occurs at ring greater than 0.

Writing 0 to both bits stops the performance counter. Writing 11B causes the counter to increment irrespective of privilege levels.

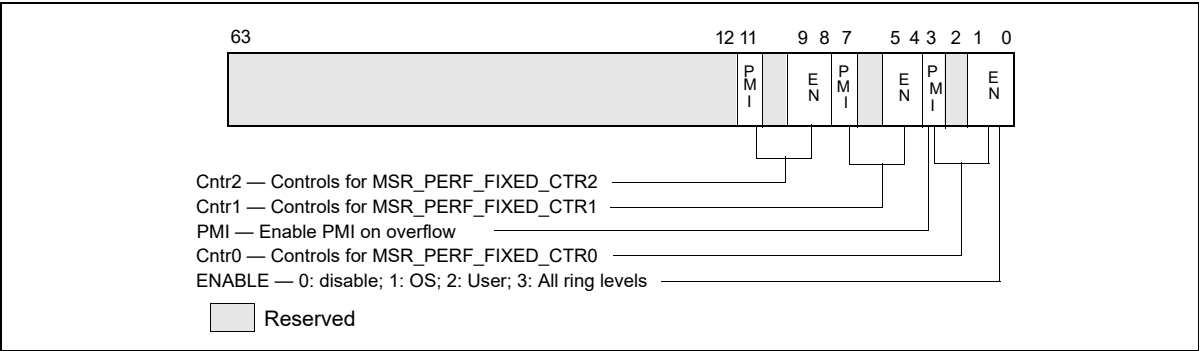

Figure 18-41. Layout of MSR\_PERF\_FIXED\_CTRL MSR

- **PMI field (fourth bit in each 4-bit control)** — When set, the logical processor generates an exception through its local APIC on overflow condition of the respective fixed-function counter.

18.6.2.2 Global Counter Control Facilities

Processors based on Intel Core microarchitecture provides simplified performance counter control that simplifies the most frequent operations in programming performance events, i.e. enabling/disabling event counting and checking the status of counter overflows. This is done by the following three MSRs:

- MSR\_PERF\_GLOBAL\_CTRL enables/disables event counting for all or any combination of fixed-function PMCs (MSR\_PERF\_FIXED\_CTRLx) or general-purpose PMCs via a single WRMSR.
- MSR\_PERF\_GLOBAL\_STATUS allows software to query counter overflow conditions on any combination of fixed-function PMCs (MSR\_PERF\_FIXED\_CTRLx) or general-purpose PMCs via a single RDMSR.
- MSR\_PERF\_GLOBAL\_OVF\_CTRL allows software to clear counter overflow conditions on any combination of fixed-function PMCs (MSR\_PERF\_FIXED\_CTRLx) or general-purpose PMCs via a single WRMSR.

MSR\_PERF\_GLOBAL\_CTRL MSR provides single-bit controls to enable counting in each performance counter (see Figure 18-42). Each enable bit in MSR\_PERF\_GLOBAL\_CTRL is AND’ed with the enable bits for all privilege levels in the respective IA32\_PERFEVTSELx or MSR\_PERF\_FIXED\_CTRL\_CTRL MSRs to start/stop the counting of respective counters. Counting is enabled if the AND’ed results is true; counting is disabled when the result is false.

Figure 18-42. Layout of MSR\_PERF\_GLOBAL\_CTRL MSR

MSR\_PERF\_GLOBAL\_STATUS MSR provides single-bit status used by software to query the overflow condition of each performance counter. MSR\_PERF\_GLOBAL\_STATUS[bit 62] indicates overflow conditions of the DS area data buffer. MSR\_PERF\_GLOBAL\_STATUS[bit 63] provides a CondChgd bit to indicate changes to the state of performance monitoring hardware (see Figure 18-43). A value of 1 in bits 34:32, 1, 0 indicates an overflow condition has

occurred in the associated counter.

**Figure 18-43. Layout of MSR\_PERF\_GLOBAL\_STATUS MSR**

When a performance counter is configured for PEBS, an overflow condition in the counter will arm PEBS. On the subsequent event following overflow, the processor will generate a PEBS event. On a PEBS event, the processor will perform bounds checks based on the parameters defined in the DS Save Area (see Section 17.4.9). Upon successful bounds checks, the processor will store the data record in the defined buffer area, clear the counter overflow status, and reload the counter. If the bounds checks fail, the PEBS will be skipped entirely. In the event that the PEBS buffer fills up, the processor will set the OvflBuffer bit in MSR\_PERF\_GLOBAL\_STATUS.

MSR\_PERF\_GLOBAL\_OVF\_CTL MSR allows software to clear overflow the indicators for general-purpose or fixed-function counters via a single WRMSR (see Figure 18-44). Clear overflow indications when:

- Setting up new values in the event select and/or UMASK field for counting or interrupt-based event sampling.
- Reloading counter values to continue collecting next sample.
- Disabling event counting or interrupt-based event sampling.

**Figure 18-44. Layout of MSR\_PERF\_GLOBAL\_OVF\_CTL MSR**

### 18.6.2.3 At-Retirement Events

Many non-architectural performance events are impacted by the speculative nature of out-of-order execution. A subset of non-architectural performance events on processors based on Intel Core microarchitecture are enhanced with a tagging mechanism (similar to that found in Intel NetBurst<sup>®</sup> microarchitecture) that exclude contributions that arise from speculative execution. The at-retirement events available in processors based on Intel Core microarchitecture does not require special MSR programming control (see Section 18.6.3.6, "At-Retirement Counting"), but is limited to IA32\_PMC0. See Table 18-67 for a list of events available to processors based on Intel Core microarchitecture.

**Table 18-67. At-Retirement Performance Events for Intel Core Microarchitecture**

| Event Name                     | UMask | Event Select |
|--------------------------------|-------|--------------|
| ITLB_MISS_RETIRED              | 00H   | C9H          |
| MEM_LOAD_RETIRED.L1D_MISS      | 01H   | CBH          |
| MEM_LOAD_RETIRED.L1D_LINE_MISS | 02H   | CBH          |
| MEM_LOAD_RETIRED.L2_MISS       | 04H   | CBH          |
| MEM_LOAD_RETIRED.L2_LINE_MISS  | 08H   | CBH          |
| MEM_LOAD_RETIRED.DTLB_MISS     | 10H   | CBH          |

### 18.6.2.4 Processor Event Based Sampling (PEBS)

Processors based on Intel Core microarchitecture also support processor event based sampling (PEBS). This feature was introduced by processors based on Intel NetBurst microarchitecture.

PEBS uses a debug store mechanism and a performance monitoring interrupt to store a set of architectural state information for the processor. The information provides architectural state of the instruction executed after the instruction that caused the event (See Section 18.6.2.4.2 and Section 17.4.9).

In cases where the same instruction causes BTS and PEBS to be activated, PEBS is processed before BTS are processed. The PMI request is held until the processor completes processing of PEBS and BTS.

For processors based on Intel Core microarchitecture, precise events that can be used with PEBS are listed in Table 18-68. The procedure for detecting availability of PEBS is the same as described in Section 18.6.3.8.1.

**Table 18-68. PEBS Performance Events for Intel Core Microarchitecture**

| Event Name                     | UMask | Event Select |
|--------------------------------|-------|--------------|
| INSTR_RETIRED.ANY_P            | 00H   | C0H          |
| X87_OPS_RETIRED.ANY            | FEH   | C1H          |
| BR_INST_RETIRED.MISPRED        | 00H   | C5H          |
| SIMD_INST_RETIRED.ANY          | 1FH   | C7H          |
| MEM_LOAD_RETIRED.L1D_MISS      | 01H   | CBH          |
| MEM_LOAD_RETIRED.L1D_LINE_MISS | 02H   | CBH          |
| MEM_LOAD_RETIRED.L2_MISS       | 04H   | CBH          |
| MEM_LOAD_RETIRED.L2_LINE_MISS  | 08H   | CBH          |
| MEM_LOAD_RETIRED.DTLB_MISS     | 10H   | CBH          |

#### 18.6.2.4.1 Setting up the PEBS Buffer

For processors based on Intel Core microarchitecture, PEBS is available using IA32\_PMC0 only. Use the following procedure to set up the processor and IA32\_PMC0 counter for PEBS:

1. Set up the precise event buffering facilities. Place values in the precise event buffer base, precise event index, precise event absolute maximum, precise event interrupt threshold, and precise event counter reset fields of the DS buffer management area. In processors based on Intel Core microarchitecture, PEBS records consist of 64-bit address entries. See Figure 17-8 to set up the precise event records buffer in memory.
2. Enable PEBS. Set the Enable PEBS on PMC0 flag (bit 0) in IA32\_PEBS\_ENABLE MSR.
3. Set up the IA32\_PMC0 performance counter and IA32\_PERFEVTSEL0 for an event listed in Table 18-68.

#### 18.6.2.4.2 PEBS Record Format

The PEBS record format may be extended across different processor implementations. The IA32\_PERF\_CAPABILITIES MSR defines a mechanism for software to handle the evolution of PEBS record format in processors that support architectural performance monitoring with version id equals 2 or higher. The bit fields of

IA32\_PERF\_CAPABILITIES are defined in Table 2-2 of Chapter 2, “Model-Specific Registers (MSRs)” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4*. The relevant bit fields that governs PEBS are:

- **PEBSTrap [bit 6]:** When set, PEBS recording is trap-like. After the PEBS-enabled counter has overflowed, PEBS record is recorded for the next PEBS-able event at the completion of the sampled instruction causing the PEBS event. When clear, PEBS recording is fault-like. The PEBS record is recorded before the sampled instruction causing the PEBS event.
- **PEBSSaveArchRegs [bit 7]:** When set, PEBS will save architectural register and state information according to the encoded value of the PEBSRecordFormat field. When clear, only the return instruction pointer and flags are recorded. On processors based on Intel Core microarchitecture, this bit is always 1
- **PEBSRecordFormat [bits 11:8]:** Valid encodings are:
  - 0000B: Only general-purpose registers, instruction pointer and RFLAGS registers are saved in each PEBS record (seeSection 18.6.3.8).
  - 0001B: PEBS record includes additional information of IA32\_PERF\_GLOBAL\_STATUS and load latency data. (seeSection 18.3.1.1.1).
  - 0010B: PEBS record includes additional information of IA32\_PERF\_GLOBAL\_STATUS, load latency data, and TSX tuning information. (seeSection 18.3.6.2).
  - 0011B: PEBS record includes additional information of load latency data, TSX tuning information, TSC data, and the applicable counter field replaces IA32\_PERF\_GLOBAL\_STATUS at offset 90H. (see Section 18.3.8.1.1).

#### 18.6.2.4.3 Writing a PEBS Interrupt Service Routine

The PEBS facilities share the same interrupt vector and interrupt service routine (called the DS ISR) with the Interrupt-based event sampling and BTS facilities. To handle PEBS interrupts, PEBS handler code must be included in the DS ISR. See Section 17.4.9.1, “64 Bit Format of the DS Save Area,” for guidelines when writing the DS ISR.

The service routine can query MSR\_PERF\_GLOBAL\_STATUS to determine which counter(s) caused of overflow condition. The service routine should clear overflow indicator by writing to MSR\_PERF\_GLOBAL\_OVF\_CTL.

A comparison of the sequence of requirements to program PEBS for processors based on Intel Core and Intel NetBurst microarchitectures is listed in Table 18-69.

**Table 18-69. Requirements to Program PEBS**

|                                      | For Processors based on Intel Core microarchitecture  | For Processors based on Intel NetBurst microarchitecture |
|--------------------------------------|---|--|
| Verify PEBS support of processor/OS. | <ul style="list-style-type: none"> <li>▪ IA32_MISC_ENABLE.EMON_AVAILABE (bit 7) is set.</li> <li>▪ IA32_MISC_ENABLE.PEBS_UNAVAILABE (bit 12) is clear.</li> </ul>   |  |
| Ensure counters are in disabled.     | On initial set up or changing event configurations, write MSR_PERF_GLOBAL_CTRL MSR (38FH) with 0.<br>On subsequent entries: <ul style="list-style-type: none"> <li>▪ Clear all counters if “Counter Freeze on PMI” is not enabled.</li> <li>▪ If IA32_DebugCTL.Freeze is enabled, counters are automatically disabled.</li> </ul> Counters MUST be stopped before writing. <sup>1</sup> | Optional   |
| Disable PEBS.                        | Clear ENABLE PMCO bit in IA32_PEBS_ENABLE MSR (3F1H).   | Optional   |
| Check overflow conditions.           | Check MSR_PERF_GLOBAL_STATUS MSR (38EH) handle any overflow conditions.   | Check OVF flag of each CCCR for overflow condition       |
| Clear overflow status.               | Clear MSR_PERF_GLOBAL_STATUS MSR (38EH) using IA32_PERF_GLOBAL_OVF_CTRL MSR (390H).   | Clear OVF flag of each CCCR.                             |
| Write “sample-after” values.         | Configure the counter(s) with the sample after value.   |  |

**Table 18-69. Requirements to Program PEBS (Contd.)**

|   | For Processors based on Intel Core microarchitecture  | For Processors based on Intel NetBurst microarchitecture   |
|---|---|--|
| Configure specific counter configuration MSR. | <ul style="list-style-type: none"> <li>Set local enable bit 22 - 1.</li> <li>Do NOT set local counter PMI/INT bit, bit 20 - 0.</li> <li>Event programmed must be PEBS capable.</li> </ul> | <ul style="list-style-type: none"> <li>Set appropriate OVF_PMI bits - 1.</li> <li>Only CCCR for MSR_IQ_COUNTER4 support PEBS.</li> </ul> |
| Allocate buffer for PEBS states.              | Allocate a buffer in memory for the precise information.  |  |
| Program the IA32_DS_AREA MSR.                 | Program the IA32_DS_AREA MSR.   |  |
| Configure the PEBS buffer management records. | Configure the PEBS buffer management records in the DS buffer management area.  |  |
| Configure/Enable PEBS.                        | Set Enable PMCO bit in IA32_PEBS_ENABLE MSR (3F1H).   | Configure MSR_PEBS_ENABLE, MSR_PEBS_MATRIX_VERT and MSR_PEBS_MATRIX_HORZ as needed.  |
| Enable counters.                              | Set Enable bits in MSR_PERF_GLOBAL_CTRL MSR (38FH).   | Set each CCCR enable bit 12 - 1.   |

**NOTES:**

1. Counters read while enabled are not guaranteed to be precise with event counts that occur in timing proximity to the RDMSR.

**18.6.2.4.4 Re-configuring PEBS Facilities**

When software needs to reconfigure PEBS facilities, it should allow a quiescent period between stopping the prior event counting and setting up a new PEBS event. The quiescent period is to allow any latent residual PEBS records to complete its capture at their previously specified buffer address (provided by IA32\_DS\_AREA).

**18.6.3 Performance Monitoring (Processors Based on Intel NetBurst® Microarchitecture)**

The performance monitoring mechanism provided in processors based on Intel NetBurst microarchitecture is different from that provided in the P6 family and Pentium processors. While the general concept of selecting, filtering, counting, and reading performance events through the WRMSR, RDMSR, and RDPMC instructions is unchanged, the setup mechanism and MSR layouts are incompatible with the P6 family and Pentium processor mechanisms. Also, the RDPMC instruction has been extended to support faster reading of counters and to read all performance counters available in processors based on Intel NetBurst microarchitecture.

The event monitoring mechanism consists of the following facilities:

- The IA32\_MISC\_ENABLE MSR, which indicates the availability in an Intel 64 or IA-32 processor of the performance monitoring and processor event-based sampling (PEBS) facilities.
- Event selection control (ESCR) MSRs for selecting events to be monitored with specific performance counters. The number available differs by family and model (43 to 45).
- 18 performance counter MSRs for counting events.
- 18 counter configuration control (CCCR) MSRs, with one CCCR associated with each performance counter. CCCR sets up an associated performance counter for a specific method of counting.
- A debug store (DS) save area in memory for storing PEBS records.
- The IA32\_DS\_AREA MSR, which establishes the location of the DS save area.
- The debug store (DS) feature flag (bit 21) returned by the CPUID instruction, which indicates the availability of the DS mechanism.
- The MSR\_PEBS\_ENABLE MSR, which enables the PEBS facilities and replay tagging used in at-retirement event counting.
- A set of predefined events and event metrics that simplify the setting up of the performance counters to count specific events.

Table 18-70 lists the performance counters and their associated CCCRs, along with the ESCRs that select events to be counted for each performance counter. Predefined event metrics and events are listed in Chapter 19, "Perfor-

mance Monitoring Events.”

**Table 18-70. Performance Counter MSRs and Associated CCCR and ESCR MSRs (Processors Based on Intel NetBurst Microarchitecture)**

| Counter            |     |      | CCCR            |      | ESCR  |                                      |  |

**NOTES:**

1. MSR\_IQ\_ESCR0 and MSR\_IQ\_ESCR1 are available only on early processor builds (family 0FH, models 01H-02H). These MSRs are not available on later versions.

The types of events that can be counted with these performance monitoring facilities are divided into two classes: non-retirement events and at-retirement events.

- **Non-retirement events** (see Table 19-31) are events that occur any time during instruction execution (such as bus transactions or cache transactions).
- **At-retirement events** (see Table 19-32) are events that are counted at the retirement stage of instruction execution, which allows finer granularity in counting events and capturing machine state.

The at-retirement counting mechanism includes facilities for tagging  $\mu$ ops that have encountered a particular performance event during instruction execution. Tagging allows events to be sorted between those that occurred on an execution path that resulted in architectural state being committed at retirement as well as events that occurred on an execution path where the results were eventually cancelled and never committed to architectural state (such as, the execution of a mispredicted branch).

The Pentium 4 and Intel Xeon processor performance monitoring facilities support the three usage models described below. The first two models can be used to count both non-retirement and at-retirement events; the third model is used to count a subset of at-retirement events:

- **Event counting** — A performance counter is configured to count one or more types of events. While the counter is counting, software reads the counter at selected intervals to determine the number of events that have been counted between the intervals.
- **Interrupt-based event sampling** — A performance counter is configured to count one or more types of events and to generate an interrupt when it overflows. To trigger an overflow, the counter is preset to a modulus value that will cause the counter to overflow after a specific number of events have been counted. When the counter overflows, the processor generates a performance monitoring interrupt (PMI). The interrupt service routine for the PMI then records the return instruction pointer (RIP), resets the modulus, and restarts the counter. Code performance can be analyzed by examining the distribution of RIPs with a tool like the VTune™ Performance Analyzer.
- **Processor event-based sampling (PEBS)** — In PEBS, the processor writes a record of the architectural state of the processor to a memory buffer after the counter overflows. The records of architectural state provide additional information for use in performance tuning. Processor-based event sampling can be used to count only a subset of at-retirement events. PEBS captures more precise processor state information compared to interrupt based event sampling, because the latter need to use the interrupt service routine to re-construct the architectural states of processor.

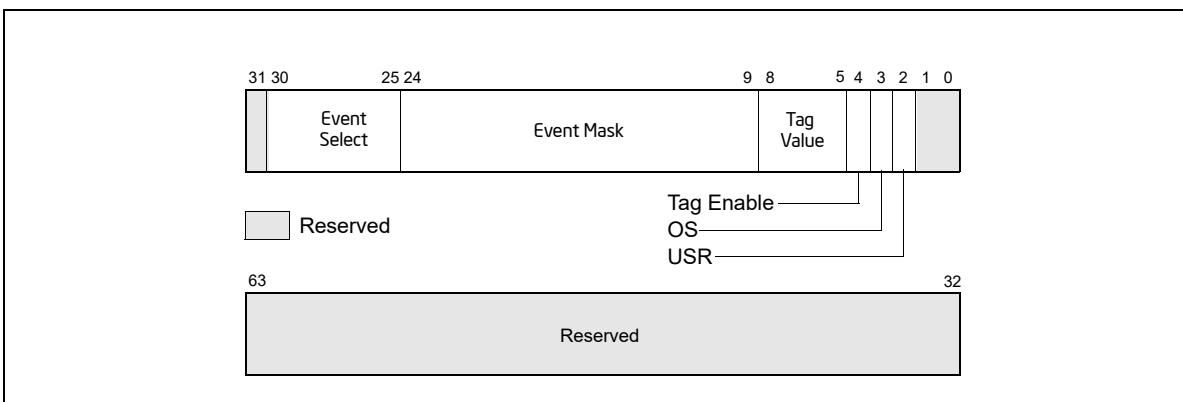

The following sections describe the MSRs and data structures used for performance monitoring in the Pentium 4 and Intel Xeon processors.

### 18.6.3.1 ESCR MSRs

The 45 ESCR MSRs (see Table 18-70) allow software to select specific events to be countered. Each ESCR is usually associated with a pair of performance counters (see Table 18-70) and each performance counter has several ESCRs associated with it (allowing the events counted to be selected from a variety of events).

Figure 18-45 shows the layout of an ESCR MSR. The functions of the flags and fields are:

- **USR flag, bit 2** — When set, events are counted when the processor is operating at a current privilege level (CPL) of 1, 2, or 3. These privilege levels are generally used by application code and unprotected operating system code.
- **OS flag, bit 3** — When set, events are counted when the processor is operating at CPL of 0. This privilege level is generally reserved for protected operating system code. (When both the OS and USR flags are set, events are counted at all privilege levels.)

**Figure 18-45. Event Selection Control Register (ESCR) for Pentium 4 and Intel Xeon Processors without Intel HT Technology Support**

- **Tag enable, bit 4** — When set, enables tagging of  $\mu$ ops to assist in at-retirement event counting; when clear, disables tagging. See Section 18.6.3.6, “At-Retirement Counting.”
- **Tag value field, bits 5 through 8** — Selects a tag value to associate with a  $\mu$ op to assist in at-retirement event counting.
- **Event mask field, bits 9 through 24** — Selects events to be counted from the event class selected with the event select field.
- **Event select field, bits 25 through 30** — Selects a class of events to be counted. The events within this class that are counted are selected with the event mask field.

When setting up an ESCR, the event select field is used to select a specific class of events to count, such as retired branches. The event mask field is then used to select one or more of the specific events within the class to be counted. For example, when counting retired branches, four different events can be counted: branch not taken predicted, branch not taken mispredicted, branch taken predicted, and branch taken mispredicted. The OS and USR flags allow counts to be enabled for events that occur when operating system code and/or application code are being executed. If neither the OS nor USR flag is set, no events will be counted.

The ESCRs are initialized to all 0s on reset. The flags and fields of an ESCR are configured by writing to the ESCR using the WRMSR instruction. Table 18-70 gives the addresses of the ESCR MSRs.

Writing to an ESCR MSR does not enable counting with its associated performance counter; it only selects the event or events to be counted. The CCCR for the selected performance counter must also be configured. Configuration of the CCCR includes selecting the ESCR and enabling the counter.

### 18.6.3.2 Performance Counters

The performance counters in conjunction with the counter configuration control registers (CCCRs) are used for filtering and counting the events selected by the ESCRs. Processors based on Intel NetBurst microarchitecture provide 18 performance counters organized into 9 pairs. A pair of performance counters is associated with a particular subset of events and ESCR's (see Table 18-70). The counter pairs are partitioned into four groups:

- The BPU group, includes two performance counter pairs:
  - MSR\_BPU\_COUNTER0 and MSR\_BPU\_COUNTER1.
  - MSR\_BPU\_COUNTER2 and MSR\_BPU\_COUNTER3.
- The MS group, includes two performance counter pairs:
  - MSR\_MS\_COUNTER0 and MSR\_MS\_COUNTER1.
  - MSR\_MS\_COUNTER2 and MSR\_MS\_COUNTER3.
- The FLAME group, includes two performance counter pairs:
  - MSR\_FLAME\_COUNTER0 and MSR\_FLAME\_COUNTER1.

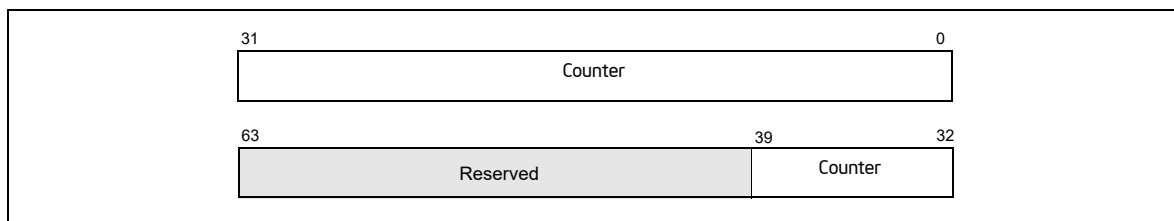

- MSR\_FLAME\_COUNTER2 and MSR\_FLAME\_COUNTER3.
- The IQ group, includes three performance counter pairs:
  - MSR\_IQ\_COUNTER0 and MSR\_IQ\_COUNTER1.
  - MSR\_IQ\_COUNTER2 and MSR\_IQ\_COUNTER3.
  - MSR\_IQ\_COUNTER4 and MSR\_IQ\_COUNTER5.

The MSR\_IQ\_COUNTER4 counter in the IQ group provides support for the PEBS.

Alternate counters in each group can be cascaded: the first counter in one pair can start the first counter in the second pair and vice versa. A similar cascading is possible for the second counters in each pair. For example, within the BPU group of counters, MSR\_BPU\_COUNTER0 can start MSR\_BPU\_COUNTER2 and vice versa, and MSR\_BPU\_COUNTER1 can start MSR\_BPU\_COUNTER3 and vice versa (see Section 18.6.3.5.6, “Cascading Counters”). The cascade flag in the CCCR register for the performance counter enables the cascading of counters.

Each performance counter is 40-bits wide (see Figure 18-46). The RDPMC instruction is intended to allow reading of either the full counter-width (40-bits) or the low 32-bits of the counter. Reading the low 32-bits is faster than reading the full counter width and is appropriate in situations where the count is small enough to be contained in 32 bits.

The RDPMC instruction can be used by programs or procedures running at any privilege level and in virtual-8086 mode to read these counters. The PCE flag in control register CR4 (bit 8) allows the use of this instruction to be restricted to only programs and procedures running at privilege level 0.

**Figure 18-46. Performance Counter (Pentium 4 and Intel Xeon Processors)**

The RDPMC instruction is not serializing or ordered with other instructions. Thus, it does not necessarily wait until all previous instructions have been executed before reading the counter. Similarly, subsequent instructions may begin execution before the RDPMC instruction operation is performed.

Only the operating system, executing at privilege level 0, can directly manipulate the performance counters, using the RDMSR and WRMSR instructions. A secure operating system would clear the PCE flag during system initialization to disable direct user access to the performance-monitoring counters, but provide a user-accessible programming interface that emulates the RDPMC instruction.

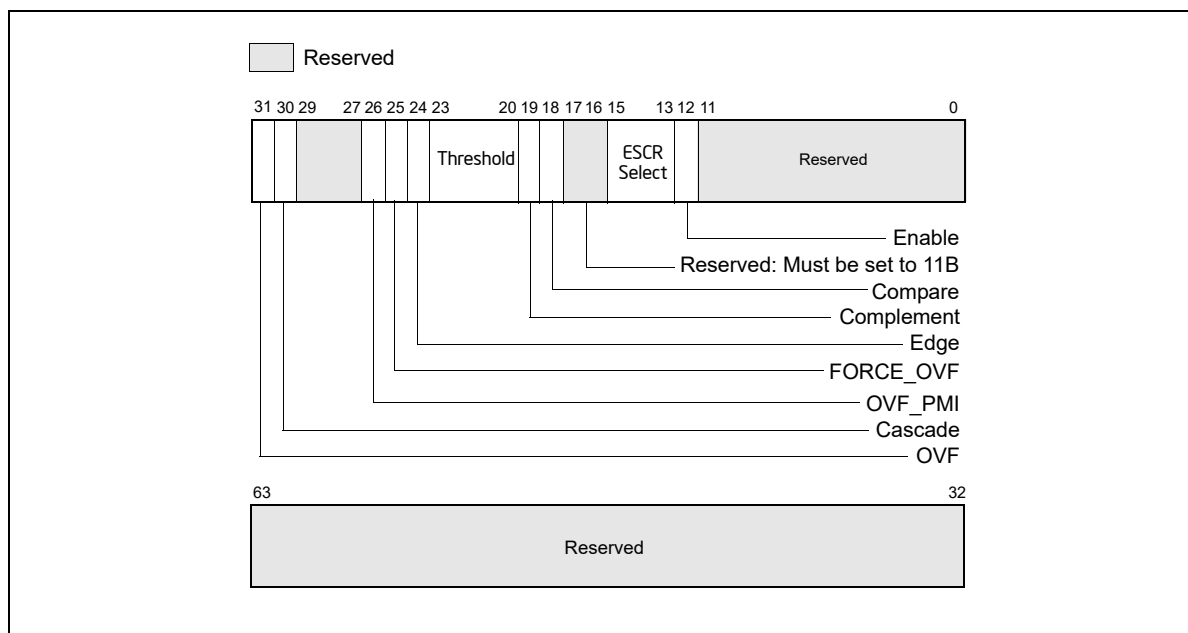

Some uses of the performance counters require the counters to be preset before counting begins (that is, before the counter is enabled). This can be accomplished by writing to the counter using the WRMSR instruction. To set a counter to a specified number of counts before overflow, enter a 2s complement negative integer in the counter. The counter will then count from the preset value up to -1 and overflow. Writing to a performance counter in a Pentium 4 or Intel Xeon processor with the WRMSR instruction causes all 40 bits of the counter to be written.

### 18.6.3.3 CCCR MSRs

Each of the 18 performance counters has one CCCR MSR associated with it (see Table 18-70). The CCCRs control the filtering and counting of events as well as interrupt generation. Figure 18-47 shows the layout of an CCCR MSR. The functions of the flags and fields are as follows:

- **Enable flag, bit 12** — When set, enables counting; when clear, the counter is disabled. This flag is cleared on reset.
- **ESCR select field, bits 13 through 15** — Identifies the ESCR to be used to select events to be counted with the counter associated with the CCCR.

- **Compare flag, bit 18** — When set, enables filtering of the event count; when clear, disables filtering. The filtering method is selected with the threshold, complement, and edge flags.
- **Complement flag, bit 19** — Selects how the incoming event count is compared with the threshold value. When set, event counts that are less than or equal to the threshold value result in a single count being delivered to the performance counter; when clear, counts greater than the threshold value result in a count being delivered to the performance counter (see Section 18.6.3.5.2, “Filtering Events”). The complement flag is not active unless the compare flag is set.
- **Threshold field, bits 20 through 23** — Selects the threshold value to be used for comparisons. The processor examines this field only when the compare flag is set, and uses the complement flag setting to determine the type of threshold comparison to be made. The useful range of values that can be entered in this field depend on the type of event being counted (see Section 18.6.3.5.2, “Filtering Events”).
- **Edge flag, bit 24** — When set, enables rising edge (false-to-true) edge detection of the threshold comparison output for filtering event counts; when clear, rising edge detection is disabled. This flag is active only when the compare flag is set.

**Figure 18-47. Counter Configuration Control Register (CCCR)**

- **FORCE\_OVF flag, bit 25** — When set, forces a counter overflow on every counter increment; when clear, overflow only occurs when the counter actually overflows.
- **OVF\_PMI flag, bit 26** — When set, causes a performance monitor interrupt (PMI) to be generated when the counter overflows occurs; when clear, disables PMI generation. Note that the PMI is generated on the next event count after the counter has overflowed.
- **Cascade flag, bit 30** — When set, enables counting on one counter of a counter pair when its alternate counter in the other the counter pair in the same counter group overflows (see Section 18.6.3.2, “Performance Counters,” for further details); when clear, disables cascading of counters.
- **OVF flag, bit 31** — Indicates that the counter has overflowed when set. This flag is a sticky flag that must be explicitly cleared by software.

The CCCRs are initialized to all 0s on reset.

The events that an enabled performance counter actually counts are selected and filtered by the following flags and fields in the ESCR and CCCR registers and in the qualification order given:

1. The event select and event mask fields in the ESCR select a class of events to be counted and one or more event types within the class, respectively.

2. The OS and USR flags in the ESCR selected the privilege levels at which events will be counted.
3. The ESCR select field of the CCCR selects the ESCR. Since each counter has several ESCRs associated with it, one ESCR must be chosen to select the classes of events that may be counted.
4. The compare and complement flags and the threshold field of the CCCR select an optional threshold to be used in qualifying an event count.
5. The edge flag in the CCCR allows events to be counted only on rising-edge transitions.

The qualification order in the above list implies that the filtered output of one “stage” forms the input for the next. For instance, events filtered using the privilege level flags can be further qualified by the compare and complement flags and the threshold field, and an event that matched the threshold criteria, can be further qualified by edge detection.

The uses of the flags and fields in the CCCRs are discussed in greater detail in Section 18.6.3.5, “Programming the Performance Counters for Non-Retirement Events.”

#### 18.6.3.4 Debug Store (DS) Mechanism

The debug store (DS) mechanism was introduced with processors based on Intel NetBurst microarchitecture to allow various types of information to be collected in memory-resident buffers for use in debugging and tuning programs. The DS mechanism can be used to collect two types of information: branch records and processor event-based sampling (PEBS) records. The availability of the DS mechanism in a processor is indicated with the DS feature flag (bit 21) returned by the CPUID instruction.

See Section 17.4.5, “Branch Trace Store (BTS),” and Section 18.6.3.8, “Processor Event-Based Sampling (PEBS),” for a description of these facilities. Records collected with the DS mechanism are saved in the DS save area. See Section 17.4.9, “BTS and DS Save Area.”

#### 18.6.3.5 Programming the Performance Counters for Non-Retirement Events

The basic steps to program a performance counter and to count events include the following:

1. Select the event or events to be counted.
2. For each event, select an ESCR that supports the event using the values in the ESCR restrictions row in Table 19-31, Chapter 19.
3. Match the CCCR Select value and ESCR name in Table 19-31 to a value listed in Table 18-70; select a CCCR and performance counter.
4. Set up an ESCR for the specific event or events to be counted and the privilege levels at which they are to be counted.
5. Set up the CCCR for the performance counter by selecting the ESCR and the desired event filters.
6. Set up the CCCR for optional cascading of event counts, so that when the selected counter overflows its alternate counter starts.
7. Set up the CCCR to generate an optional performance monitor interrupt (PMI) when the counter overflows. If PMI generation is enabled, the local APIC must be set up to deliver the interrupt to the processor and a handler for the interrupt must be in place.
8. Enable the counter to begin counting.

### 18.6.3.5.1 Selecting Events to Count

Table 19-32 in Chapter 19 lists a set of at-retirement events for processors based on Intel NetBurst microarchitecture. For each event listed in Table 19-32, setup information is provided. Table 18-71 gives an example of one of the events.

**Table 18-71. Event Example**

| Event Name     | Event Parameters                     | Parameter Value                              | Description  |
|----------------|--------------------------------------|--|--|
| branch_retired |                                      |  | Counts the retirement of a branch. Specify one or more mask bits to select any combination of branch taken, not-taken, predicted and mispredicted. |
|                | ESCR restrictions                    | MSR_CRU_ESCR2<br>MSR_CRU_ESCR3               | See Table 15-3 for the addresses of the ESCR MSRs.   |
|                | Counter numbers per ESCR             | ESCR2: 12, 13, 16<br>ESCR3: 14, 15, 17       | The counter numbers associated with each ESCR are provided. The performance counters and corresponding CCCRs can be obtained from Table 15-3.      |
|                | ESCR Event Select                    | 06H  | ESCR[31:25]  |
|                | ESCR Event Mask                      | Bit 0: MMNP<br>1: MMNM<br>2: MMTP<br>3: MMTM | ESCR[24:9]<br>Branch Not-taken Predicted<br>Branch Not-taken Mispredicted<br>Branch Taken Predicted<br>Branch Taken Mispredicted                   |
|                | CCCR Select                          | 05H  | CCCR[15:13]  |
|                | Event Specific Notes                 |  | P6: EMON_BR_INST_RETIRED   |
|                | Can Support PEBS                     | No   |  |
|                | Requires Additional MSRs for Tagging | No   |  |

For Table 19-31 and Table 19-32, Chapter 19, the name of the event is listed in the Event Name column and parameters that define the event and other information are listed in the Event Parameters column. The Parameter Value and Description columns give specific parameters for the event and additional description information. Entries in the Event Parameters column are described below.

- **ESCR restrictions** — Lists the ESCRs that can be used to program the event. Typically only one ESCR is needed to count an event.
- **Counter numbers per ESCR** — Lists which performance counters are associated with each ESCR. Table 18-70 gives the name of the counter and CCCR for each counter number. Typically only one counter is needed to count the event.
- **ESCR event select** — Gives the value to be placed in the event select field of the ESCR to select the event.
- **ESCR event mask** — Gives the value to be placed in the Event Mask field of the ESCR to select sub-events to be counted. The parameter value column defines the documented bits with relative bit position offset starting from 0, where the absolute bit position of relative offset 0 is bit 9 of the ESCR. All undocumented bits are reserved and should be set to 0.
- **CCCR select** — Gives the value to be placed in the ESCR select field of the CCCR associated with the counter to select the ESCR to be used to define the event. This value is not the address of the ESCR; it is the number of the ESCR from the Number column in Table 18-70.
- **Event specific notes** — Gives additional information about the event, such as the name of the same or a similar event defined for the P6 family processors.
- **Can support PEBS** — Indicates if PEBS is supported for the event (only supplied for at-retirement events listed in Table 19-32.)
- **Requires additional MSR for tagging** — Indicates which if any additional MSRs must be programmed to count the events (only supplied for the at-retirement events listed in Table 19-32.)

**NOTE**

The performance-monitoring events listed in Chapter 19, “Performance Monitoring Events,” are intended to be used as guides for performance tuning. The counter values reported are not guaranteed to be absolutely accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

The following procedure shows how to set up a performance counter for basic counting; that is, the counter is set up to count a specified event indefinitely, wrapping around whenever it reaches its maximum count. This procedure is continued through the following four sections.

Using information in Table 19-31, Chapter 19, an event to be counted can be selected as follows:

1. Select the event to be counted.
2. Select the ESCR to be used to select events to be counted from the ESCRs field.
3. Select the number of the counter to be used to count the event from the Counter Numbers Per ESCR field.
4. Determine the name of the counter and the CCCR associated with the counter, and determine the MSR addresses of the counter, CCCR, and ESCR from Table 18-70.
5. Use the WRMSR instruction to write the ESCR Event Select and ESCR Event Mask values into the appropriate fields in the ESCR. At the same time set or clear the USR and OS flags in the ESCR as desired.
6. Use the WRMSR instruction to write the CCCR Select value into the appropriate field in the CCCR.

**NOTE**

Typically all the fields and flags of the CCCR will be written with one WRMSR instruction; however, in this procedure, several WRMSR writes are used to more clearly demonstrate the uses of the various CCCR fields and flags.

This setup procedure is continued in the next section, Section 18.6.3.5.2, “Filtering Events.”

**18.6.3.5.2 Filtering Events**

Each counter receives up to 4 input lines from the processor hardware from which it is counting events. The counter treats these inputs as binary inputs (input 0 has a value of 1, input 1 has a value of 2, input 2 has a value of 4, and input 3 has a value of 8). When a counter is enabled, it adds this binary input value to the counter value on each clock cycle. For each clock cycle, the value added to the counter can then range from 0 (no event) to 15.

For many events, only the 0 input line is active, so the counter is merely counting the clock cycles during which the 0 input is asserted. However, for some events two or more input lines are used. Here, the counter's threshold setting can be used to filter events. The compare, complement, threshold, and edge fields control the filtering of counter increments by input value.

If the compare flag is set, then a “greater than” or a “less than or equal to” comparison of the input value vs. a threshold value can be made. The complement flag selects “less than or equal to” (flag set) or “greater than” (flag clear). The threshold field selects a threshold value of from 0 to 15. For example, if the complement flag is cleared and the threshold field is set to 6, then any input value of 7 or greater on the 4 inputs to the counter will cause the counter to be incremented by 1, and any value less than 7 will cause an increment of 0 (or no increment) of the counter. Conversely, if the complement flag is set, any value from 0 to 6 will increment the counter and any value from 7 to 15 will not increment the counter. Note that when a threshold condition has been satisfied, the input to the counter is always 1, not the input value that is presented to the threshold filter.

The edge flag provides further filtering of the counter inputs when a threshold comparison is being made. The edge flag is only active when the compare flag is set. When the edge flag is set, the resulting output from the threshold filter (a value of 0 or 1) is used as an input to the edge filter. Each clock cycle, the edge filter examines the last and current input values and sends a count to the counter only when it detects a “rising edge” event; that is, a false-to-true transition. Figure 18-48 illustrates rising edge filtering.

The following procedure shows how to configure a CCCR to filter events using the threshold filter and the edge filter. This procedure is a continuation of the setup procedure introduced in Section 18.6.3.5.1, “Selecting Events to Count.”

7. (Optional) To set up the counter for threshold filtering, use the WRMSR instruction to write values in the CCCR compare and complement flags and the threshold field:
  - Set the compare flag.
  - Set or clear the complement flag for less than or equal to or greater than comparisons, respectively.
  - Enter a value from 0 to 15 in the threshold field.
8. (Optional) Select rising edge filtering by setting the CCCR edge flag.

This setup procedure is continued in the next section, Section 18.6.3.5.3, “Starting Event Counting.”

**Figure 18-48. Effects of Edge Filtering**

### 18.6.3.5.3 Starting Event Counting

Event counting by a performance counter can be initiated in either of two ways. The typical way is to set the enable flag in the counter's CCCR. Following the instruction to set the enable flag, event counting begins and continues until it is stopped (see Section 18.6.3.5.5, “Halting Event Counting”).

The following procedural step shows how to start event counting. This step is a continuation of the setup procedure introduced in Section 18.6.3.5.2, “Filtering Events.”

9. To start event counting, use the WRMSR instruction to set the CCCR enable flag for the performance counter.

This setup procedure is continued in the next section, Section 18.6.3.5.4, “Reading a Performance Counter's Count.”

The second way that a counter can be started by using the cascade feature. Here, the overflow of one counter automatically starts its alternate counter (see Section 18.6.3.5.6, “Cascading Counters”).

### 18.6.3.5.4 Reading a Performance Counter's Count

Performance counters can be read using either the RDPMC or RDMSR instructions. The enhanced functions of the RDPMC instruction (including fast read) are described in Section 18.6.3.2, “Performance Counters.” These instructions can be used to read a performance counter while it is counting or when it is stopped.

The following procedural step shows how to read the event counter. This step is a continuation of the setup procedure introduced in Section 18.6.3.5.3, “Starting Event Counting.”

10. To read a performance counters current event count, execute the RDPMC instruction with the counter number obtained from Table 18-70 used as an operand.

This setup procedure is continued in the next section, Section 18.6.3.5.5, “Halting Event Counting.”

### 18.6.3.5.5 Halting Event Counting

After a performance counter has been started (enabled), it continues counting indefinitely. If the counter overflows (goes one count past its maximum count), it wraps around and continues counting. When the counter wraps

around, it sets its OVF flag to indicate that the counter has overflowed. The OVF flag is a sticky flag that indicates that the counter has overflowed at least once since the OVF bit was last cleared.

To halt counting, the CCCR enable flag for the counter must be cleared.

The following procedural step shows how to stop event counting. This step is a continuation of the setup procedure introduced in Section 18.6.3.5.4, “Reading a Performance Counter’s Count.”

11. To stop event counting, execute a WRMSR instruction to clear the CCCR enable flag for the performance counter.

To halt a cascaded counter (a counter that was started when its alternate counter overflowed), either clear the Cascade flag in the cascaded counter’s CCCR MSR or clear the OVF flag in the alternate counter’s CCCR MSR.

#### 18.6.3.5.6 Cascading Counters

As described in Section 18.6.3.2, “Performance Counters,” eighteen performance counters are implemented in pairs. Nine pairs of counters and associated CCCRs are further organized as four blocks: BPU, MS, FLAME, and IQ (see Table 18-70). The first three blocks contain two pairs each. The IQ block contains three pairs of counters (12 through 17) with associated CCCRs (MSR\_IQ\_CCCR0 through MSR\_IQ\_CCCR5).

The first 8 counter pairs (0 through 15) can be programmed using ESCRs to detect performance monitoring events. Pairs of ESCRs in each of the four blocks allow many different types of events to be counted. The cascade flag in the CCCR MSR allows nested monitoring of events to be performed by cascading one counter to a second counter located in another pair in the same block (see Figure 18-47 for the location of the flag).

Counters 0 and 1 form the first pair in the BPU block. Either counter 0 or 1 can be programmed to detect an event via MSR\_MOB\_ESCR0. Counters 0 and 2 can be cascaded in any order, as can counters 1 and 3. It’s possible to set up 4 counters in the same block to cascade on two pairs of independent events. The pairing described also applies to subsequent blocks. Since the IQ PUB has two extra counters, cascading operates somewhat differently if 16 and 17 are involved. In the IQ block, counter 16 can only be cascaded from counter 14 (not from 12); counter 14 cannot be cascaded from counter 16 using the CCCR cascade bit mechanism. Similar restrictions apply to counter 17.

#### Example 18-1. Counting Events

Assume a scenario where counter X is set up to count 200 occurrences of event A; then counter Y is set up to count 400 occurrences of event B. Each counter is set up to count a specific event and overflow to the next counter. In the above example, counter X is preset for a count of -200 and counter Y for a count of -400; this setup causes the counters to overflow on the 200th and 400th counts respectively.

Continuing this scenario, counter X is set up to count indefinitely and wraparound on overflow. This is described in the basic performance counter setup procedure that begins in Section 18.6.3.5.1, “Selecting Events to Count.” Counter Y is set up with the cascade flag in its associated CCCR MSR set to 1 and its enable flag set to 0.

To begin the nested counting, the enable bit for the counter X is set. Once enabled, counter X counts until it overflows. At this point, counter Y is automatically enabled and begins counting. Thus counter X overflows after 200 occurrences of event A. Counter Y then starts, counting 400 occurrences of event B before overflowing. When performance counters are cascaded, the counter Y would typically be set up to generate an interrupt on overflow. This is described in Section 18.6.3.5.8, “Generating an Interrupt on Overflow.”

The cascading counters mechanism can be used to count a single event. The counting begins on one counter then continues on the second counter after the first counter overflows. This technique doubles the number of event counts that can be recorded, since the contents of the two counters can be added together.

#### 18.6.3.5.7 EXTENDED CASCADING

Extended cascading is a model-specific feature in the Intel NetBurst microarchitecture with CPUID DisplayFamily\_DisplayModel 0F\_02, 0F\_03, 0F\_04, 0F\_06. This feature uses bit 11 in CCCRs associated with the IQ

block. See Table 18-72.

**Table 18-72. CCR Names and Bit Positions**

| CCCR Name:Bit Position | Bit Name     | Description                               |
|------------------------|--------------|---|
| MSR_IQ_CCCR1 2:11      | Reserved     |   |
| MSR_IQ_CCCR0:11        | CASCNT4INT00 | Allow counter 4 to cascade into counter 0 |
| MSR_IQ_CCCR3:11        | CASCNT5INT03 | Allow counter 5 to cascade into counter 3 |
| MSR_IQ_CCCR4:11        | CASCNT5INT04 | Allow counter 5 to cascade into counter 4 |
| MSR_IQ_CCCR5:11        | CASCNT4INT05 | Allow counter 4 to cascade into counter 5 |

The extended cascading feature can be adapted to the Interrupt based sampling usage model for performance monitoring. However, it is known that performance counters do not generate PMI in cascade mode or extended cascade mode due to an erratum. This erratum applies to processors with CPUID DisplayFamily\_DisplayModel signature of 0F\_02. For processors with CPUID DisplayFamily\_DisplayModel signature of 0F\_00 and 0F\_01, the erratum applies to processors with stepping encoding greater than 09H.

Counters 16 and 17 in the IQ block are frequently used in processor event-based sampling or at-retirement counting of events indicating a stalled condition in the pipeline. Neither counter 16 or 17 can initiate the cascading of counter pairs using the cascade bit in a CCCR.

Extended cascading permits performance monitoring tools to use counters 16 and 17 to initiate cascading of two counters in the IQ block. Extended cascading from counter 16 and 17 is conceptually similar to cascading other counters, but instead of using CASCADE bit of a CCCR, one of the four CASCNTxINTOy bits is used.

#### Example 18-2. Scenario for Extended Cascading

A usage scenario for extended cascading is to sample instructions retired on logical processor 1 after the first 4096 instructions retired on logical processor 0. A procedure to program extended cascading in this scenario is outlined below:

1. Write the value 0 to counter 12.
2. Write the value 04000603H to MSR\_CRU\_ESCR0 (corresponding to selecting the NBOGNTAG and NBOGTAG event masks with qualification restricted to logical processor 1).
3. Write the value 04038800H to MSR\_IQ\_CCCR0. This enables CASCNT4INT00 and OVF\_PMI. An ISR can sample on instruction addresses in this case (do not set ENABLE, or CASCADE).
4. Write the value FFFF000H into counter 16.1.
5. Write the value 0400060CH to MSR\_CRU\_ESCR2 (corresponding to selecting the NBOGNTAG and NBOGTAG event masks with qualification restricted to logical processor 0).
6. Write the value 00039000H to MSR\_IQ\_CCCR4 (set ENABLE bit, but not OVF\_PMI).

Another use for cascading is to locate stalled execution in a multithreaded application. Assume MOB replays in thread B cause thread A to stall. Getting a sample of the stalled execution in this scenario could be accomplished by:

1. Set up counter B to count MOB replays on thread B.
2. Set up counter A to count resource stalls on thread A; set its force overflow bit and the appropriate CASCNTx-INTOy bit.
3. Use the performance monitoring interrupt to capture the program execution data of the stalled thread.

#### 18.6.3.5.8 Generating an Interrupt on Overflow

Any performance counter can be configured to generate a performance monitor interrupt (PMI) if the counter overflows. The PMI interrupt service routine can then collect information about the state of the processor or program

when overflow occurred. This information can then be used with a tool like the Intel® VTune™ Performance Analyzer to analyze and tune program performance.

To enable an interrupt on counter overflow, the OVR\_PMI flag in the counter's associated CCCR MSR must be set. When overflow occurs, a PMI is generated through the local APIC. (Here, the performance counter entry in the local vector table [LVT] is set up to deliver the interrupt generated by the PMI to the processor.)

The PMI service routine can use the OVF flag to determine which counter overflowed when multiple counters have been configured to generate PMIs. Also, note that these processors mask PMIs upon receiving an interrupt. Clear this condition before leaving the interrupt handler.

When generating interrupts on overflow, the performance counter being used should be preset to value that will cause an overflow after a specified number of events are counted plus 1. The simplest way to select the preset value is to write a negative number into the counter, as described in Section 18.6.3.5.6, "Cascading Counters." Here, however, if an interrupt is to be generated after 100 event counts, the counter should be preset to minus 100 plus 1 ( $-100 + 1$ ), or -99. The counter will then overflow after it counts 99 events and generate an interrupt on the next (100th) event counted. The difference of 1 for this count enables the interrupt to be generated immediately after the selected event count has been reached, instead of waiting for the overflow to be propagation through the counter.

Because of latency in the microarchitecture between the generation of events and the generation of interrupts on overflow, it is sometimes difficult to generate an interrupt close to an event that caused it. In these situations, the FORCE\_OVF flag in the CCCR can be used to improve reporting. Setting this flag causes the counter to overflow on every counter increment, which in turn triggers an interrupt after every counter increment.

#### 18.6.3.5.9 Counter Usage Guideline

There are some instances where the user must take care to configure counting logic properly, so that it is not powered down. To use any ESCR, even when it is being used just for tagging, (any) one of the counters that the particular ESCR (or its paired ESCR) can be connected to should be enabled. If this is not done, 0 counts may result. Likewise, to use any counter, there must be some event selected in a corresponding ESCR (other than no\_event, which generally has a select value of 0).

#### 18.6.3.6 At-Retirement Counting

At-retirement counting provides a means counting only events that represent work committed to architectural state and ignoring work that was performed speculatively and later discarded.

One example of this speculative activity is branch prediction. When a branch misprediction occurs, the results of instructions that were decoded and executed down the mispredicted path are canceled. If a performance counter was set up to count all executed instructions, the count would include instructions whose results were canceled as well as those whose results committed to architectural state.

To provide finer granularity in event counting in these situations, the performance monitoring facilities provided in the Pentium 4 and Intel Xeon processors provide a mechanism for tagging events and then counting only those tagged events that represent committed results. This mechanism is called "at-retirement counting."

Tables 19-32 through 19-36 list predefined at-retirement events and event metrics that can be used to for tagging events when using at retirement counting. The following terminology is used in describing at-retirement counting:

- **Bogus, non-bogus, retire** — In at-retirement event descriptions, the term "bogus" refers to instructions or  $\mu$ ops that must be canceled because they are on a path taken from a mispredicted branch. The terms "retired" and "non-bogus" refer to instructions or  $\mu$ ops along the path that results in committed architectural state changes as required by the program being executed. Thus instructions and  $\mu$ ops are either bogus or non-bogus, but not both. Several of the Pentium 4 and Intel Xeon processors' performance monitoring events (such as, Instruction\_Retired and Uops\_Retired in Table 19-32) can count instructions or  $\mu$ ops that are retired based on the characterization of bogus" versus non-bogus.
- **Tagging** — Tagging is a means of marking  $\mu$ ops that have encountered a particular performance event so they can be counted at retirement. During the course of execution, the same event can happen more than once per  $\mu$ op and a direct count of the event would not provide an indication of how many  $\mu$ ops encountered that event. The tagging mechanisms allow a  $\mu$ op to be tagged once during its lifetime and thus counted once at retirement. The retired suffix is used for performance metrics that increment a count once per  $\mu$ op, rather than once per

event. For example, a  $\mu$ op may encounter a cache miss more than once during its life time, but a “Miss Retired” metric (that counts the number of retired  $\mu$ ops that encountered a cache miss) will increment only once for that  $\mu$ op. A “Miss Retired” metric would be useful for characterizing the performance of the cache hierarchy for a particular instruction sequence. Details of various performance metrics and how these can be constructed using the Pentium 4 and Intel Xeon processors performance events are provided in the *Intel Pentium 4 Processor Optimization Reference Manual* (see Section 1.4, “Related Literature”).

- **Replay** — To maximize performance for the common case, the Intel NetBurst microarchitecture aggressively schedules  $\mu$ ops for execution before all the conditions for correct execution are guaranteed to be satisfied. In the event that all of these conditions are not satisfied,  $\mu$ ops must be reissued. The mechanism that the Pentium 4 and Intel Xeon processors use for this reissuing of  $\mu$ ops is called replay. Some examples of replay causes are cache misses, dependence violations, and unforeseen resource constraints. In normal operation, some number of replays is common and unavoidable. An excessive number of replays is an indication of a performance problem.
- **Assist** — When the hardware needs the assistance of microcode to deal with some event, the machine takes an assist. One example of this is an underflow condition in the input operands of a floating-point operation. The hardware must internally modify the format of the operands in order to perform the computation. Assists clear the entire machine of  $\mu$ ops before they begin and are costly.

#### 18.6.3.6.1 Using At-Retirement Counting

Processors based on Intel NetBurst microarchitecture allow counting both events and  $\mu$ ops that encountered a specified event. For a subset of the at-retirement events listed in Table 19-32, a  $\mu$ op may be tagged when it encounters that event. The tagging mechanisms can be used in Interrupt-based event sampling, and a subset of these mechanisms can be used in PEBS. There are four independent tagging mechanisms, and each mechanism uses a different event to count  $\mu$ ops tagged with that mechanism:

- **Front-end tagging** — This mechanism pertains to the tagging of  $\mu$ ops that encountered front-end events (for example, trace cache and instruction counts) and are counted with the `Front_end_event` event.
- **Execution tagging** — This mechanism pertains to the tagging of  $\mu$ ops that encountered execution events (for example, instruction types) and are counted with the `Execution_Event` event.
- **Replay tagging** — This mechanism pertains to tagging of  $\mu$ ops whose retirement is replayed (for example, a cache miss) and are counted with the `Replay_event` event. Branch mispredictions are also tagged with this mechanism.
- **No tags** — This mechanism does not use tags. It uses the `Instr_retired` and the `Uops_retired` events.

Each tagging mechanism is independent from all others; that is, a  $\mu$ op that has been tagged using one mechanism will not be detected with another mechanism’s tagged- $\mu$ op detector. For example, if  $\mu$ ops are tagged using the front-end tagging mechanisms, the `Replay_event` will not count those as tagged  $\mu$ ops unless they are also tagged using the replay tagging mechanism. However, execution tags allow up to four different types of  $\mu$ ops to be counted at retirement through execution tagging.

The independence of tagging mechanisms does not hold when using PEBS. When using PEBS, only one tagging mechanism should be used at a time.

Certain kinds of  $\mu$ ops that cannot be tagged, including I/O, uncacheable and locked accesses, returns, and far transfers.

Table 19-32 lists the performance monitoring events that support at-retirement counting: specifically the `Front_end_event`, `Execution_event`, `Replay_event`, `Inst_retired` and `Uops_retired` events. The following sections describe the tagging mechanisms for using these events to tag  $\mu$ op and count tagged  $\mu$ ops.

#### 18.6.3.6.2 Tagging Mechanism for Front\_end\_event

The `Front_end_event` counts  $\mu$ ops that have been tagged as encountering any of the following events:

- **$\mu$ op decode events** — Tagging  $\mu$ ops for  $\mu$ op decode events requires specifying bits in the `ESCR` associated with the performance-monitoring event, `Uop_type`.
- **Trace cache events** — Tagging  $\mu$ ops for trace cache events may require specifying certain bits in the `MSR_TC_PRECISE_EVENT` MSR (see Table 19-34).

Table 19-32 describes the Front\_end\_event and Table 19-34 describes metrics that are used to set up a Front\_end\_event count.

The MSRs specified in the Table 19-32 that are supported by the front-end tagging mechanism must be set and one or both of the NBOGUS and BOGUS bits in the Front\_end\_event event mask must be set to count events. None of the events currently supported requires the use of the MSR\_TC\_PRECISE\_EVENT MSR.

#### 18.6.3.6.3 Tagging Mechanism For Execution\_event

Table 19-32 describes the Execution\_event and Table 19-35 describes metrics that are used to set up an Execution\_event count.

The execution tagging mechanism differs from other tagging mechanisms in how it causes tagging. One *upstream* ESCR is used to specify an event to detect and to specify a tag value (bits 5 through 8) to identify that event. A second *downstream* ESCR is used to detect  $\mu$ ops that have been tagged with that tag value identifier using Execution\_event for the event selection.

The upstream ESCR that counts the event must have its tag enable flag (bit 4) set and must have an appropriate tag value mask entered in its tag value field. The 4-bit tag value mask specifies which of tag bits should be set for a particular  $\mu$ op. The value selected for the tag value should coincide with the event mask selected in the downstream ESCR. For example, if a tag value of 1 is set, then the event mask of NBOGUS0 should be enabled, correspondingly in the downstream ESCR. The downstream ESCR detects and counts tagged  $\mu$ ops. The normal (not tag value) mask bits in the downstream ESCR specify which tag bits to count. If any one of the tag bits selected by the mask is set, the related counter is incremented by one. This mechanism is summarized in the Table 19-35 metrics that are supported by the execution tagging mechanism. The tag enable and tag value bits are irrelevant for the downstream ESCR used to select the Execution\_event.

The four separate tag bits allow the user to simultaneously but distinctly count up to four execution events at retirement. (This applies for interrupt-based event sampling. There are additional restrictions for PEBS as noted in Section 18.6.3.8.3, "Setting Up the PEBS Buffer.") It is also possible to detect or count combinations of events by setting multiple tag value bits in the upstream ESCR or multiple mask bits in the downstream ESCR. For example, use a tag value of 3H in the upstream ESCR and use NBOGUS0/NBOGUS1 in the downstream ESCR event mask.

#### 18.6.3.7 Tagging Mechanism for Replay\_event

Table 19-32 describes the Replay\_event and Table 19-36 describes metrics that are used to set up an Replay\_event count.

The replay mechanism enables tagging of  $\mu$ ops for a subset of all replays before retirement. Use of the replay mechanism requires selecting the type of  $\mu$ op that may experience the replay in the MSR\_PEBS\_MATRIX\_VERT MSR and selecting the type of event in the MSR\_PEBS\_ENABLE MSR. Replay tagging must also be enabled with the UOP\_Tag flag (bit 24) in the MSR\_PEBS\_ENABLE MSR.

The Table 19-36 lists the metrics that are support the replay tagging mechanism and the at-retirement events that use the replay tagging mechanism, and specifies how the appropriate MSRs need to be configured. The replay tags defined in Table A-5 also enable Processor Event-Based Sampling (PEBS, see Section 17.4.9). Each of these replay tags can also be used in normal sampling by not setting Bit 24 nor Bit 25 in IA\_32\_PEBS\_ENABLE\_MSR. Each of these metrics requires that the Replay\_Event (see Table 19-32) be used to count the tagged  $\mu$ ops.

#### 18.6.3.8 Processor Event-Based Sampling (PEBS)

The debug store (DS) mechanism in processors based on Intel NetBurst microarchitecture allow two types of information to be collected for use in debugging and tuning programs: PEBS records and BTS records. See Section 17.4.5, "Branch Trace Store (BTS)," for a description of the BTS mechanism.

PEBS permits the saving of precise architectural information associated with one or more performance events in the precise event records buffer, which is part of the DS save area (see Section 17.4.9, "BTS and DS Save Area"). To use this mechanism, a counter is configured to overflow after it has counted a preset number of events. After the counter overflows, the processor copies the current state of the general-purpose and EFLAGS registers and instruction pointer into a record in the precise event records buffer. The processor then resets the count in the performance counter and restarts the counter. When the precise event records buffer is nearly full, an interrupt is

generated, allowing the precise event records to be saved. A circular buffer is not supported for precise event records.

PEBS is supported only for a subset of the at-retirement events: `Execution_event`, `Front_end_event`, and `Replay_event`. Also, PEBS can only be carried out using the one performance counter, the `MSR_IQ_COUNTER4` MSR.

In processors based on Intel Core microarchitecture, a similar PEBS mechanism is also supported using `IA32_PMC0` and `IA32_PERFVTSEL0` MSRs (See Section 18.6.2.4).

#### 18.6.3.8.1 Detection of the Availability of the PEBS Facilities

The DS feature flag (bit 21) returned by the `CPUID` instruction indicates (when set) the availability of the DS mechanism in the processor, which supports the PEBS (and BTS) facilities. When this bit is set, the following PEBS facilities are available:

- The `PEBS_UNAVAILABLE` flag in the `IA32_MISC_ENABLE` MSR indicates (when clear) the availability of the PEBS facilities, including the `MSR_PEBS_ENABLE` MSR.
- The enable PEBS flag (bit 24) in the `MSR_PEBS_ENABLE` MSR allows PEBS to be enabled (set) or disabled (clear).
- The `IA32_DS_AREA` MSR can be programmed to point to the DS save area.

#### 18.6.3.8.2 Setting Up the DS Save Area

Section 17.4.9.2, “Setting Up the DS Save Area,” describes how to set up and enable the DS save area. This procedure is common for PEBS and BTS.

#### 18.6.3.8.3 Setting Up the PEBS Buffer

Only the `MSR_IQ_COUNTER4` performance counter can be used for PEBS. Use the following procedure to set up the processor and this counter for PEBS:

1. Set up the precise event buffering facilities. Place values in the precise event buffer base, precise event index, precise event absolute maximum, and precise event interrupt threshold, and precise event counter reset fields of the DS buffer management area (see Figure 17-5) to set up the precise event records buffer in memory.
2. Enable PEBS. Set the Enable PEBS flag (bit 24) in `MSR_PEBS_ENABLE` MSR.
3. Set up the `MSR_IQ_COUNTER4` performance counter and its associated CCCR and one or more ESCRs for PEBS as described in Tables 19-32 through 19-36.

#### 18.6.3.8.4 Writing a PEBS Interrupt Service Routine

The PEBS facilities share the same interrupt vector and interrupt service routine (called the DS ISR) with the non-precise event-based sampling and BTS facilities. To handle PEBS interrupts, PEBS handler code must be included in the DS ISR. See Section 17.4.9.5, “Writing the DS Interrupt Service Routine,” for guidelines for writing the DS ISR.

#### 18.6.3.8.5 Other DS Mechanism Implications

The DS mechanism is not available in the SMM. It is disabled on transition to the SMM mode. Similarly the DS mechanism is disabled on the generation of a machine check exception and is cleared on processor RESET and INIT.

The DS mechanism is available in real address mode.

#### 18.6.3.9 Operating System Implications

The DS mechanism can be used by the operating system as a debugging extension to facilitate failure analysis. When using this facility, a 25 to 30 times slowdown can be expected due to the effects of the trace store occurring on every taken branch.

Depending upon intended usage, the instruction pointers that are part of the branch records or the PEBS records need to have an association with the corresponding process. One solution requires the ability for the DS specific operating system module to be chained to the context switch. A separate buffer can then be maintained for each process of interest and the MSR pointing to the configuration area saved and setup appropriately on each context switch.

If the BTS facility has been enabled, then it must be disabled and state stored on transition of the system to a sleep state in which processor context is lost. The state must be restored on return from the sleep state.

It is required that an interrupt gate be used for the DS interrupt as opposed to a trap gate to prevent the generation of an endless interrupt loop.

Pages that contain buffers must have mappings to the same physical address for all processes/logical processors, such that any change to CR3 will not change DS addresses. If this requirement cannot be satisfied (that is, the feature is enabled on a per thread/process basis), then the operating system must ensure that the feature is enabled/disabled appropriately in the context switch code.

### 18.6.4 Performance Monitoring and Intel Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture

The performance monitoring capability of processors based on Intel NetBurst microarchitecture and supporting Intel Hyper-Threading Technology is similar to that described in Section 18.6.3. However, the capability is extended so that:

- Performance counters can be programmed to select events qualified by logical processor IDs.
- Performance monitoring interrupts can be directed to a specific logical processor within the physical processor.

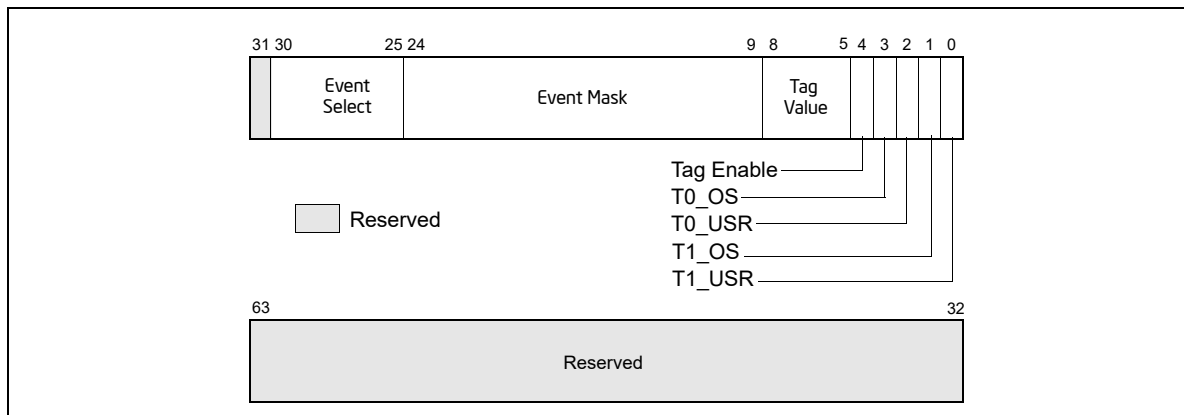

The sections below describe performance counters, event qualification by logical processor ID, and special purpose bits in ESCRs/CCCRs. They also describe MSR\_PEBS\_ENABLE, MSR\_PEBS\_MATRIX\_VERT, and MSR\_TC\_PRECISE\_EVENT.

#### 18.6.4.1 ESCR MSRs

Figure 18-49 shows the layout of an ESCR MSR in processors supporting Intel Hyper-Threading Technology.

The functions of the flags and fields are as follows:

- **T1\_USR flag, bit 0** — When set, events are counted when thread 1 (logical processor 1) is executing at a current privilege level (CPL) of 1, 2, or 3. These privilege levels are generally used by application code and unprotected operating system code.

**Figure 18-49. Event Selection Control Register (ESCR) for the Pentium 4 Processor, Intel Xeon Processor and Intel Xeon Processor MP Supporting Hyper-Threading Technology**

- **T1\_OS flag, bit 1** — When set, events are counted when thread 1 (logical processor 1) is executing at CPL of 0. This privilege level is generally reserved for protected operating system code. (When both the T1\_OS and T1\_USR flags are set, thread 1 events are counted at all privilege levels.)
- **T0\_USR flag, bit 2** — When set, events are counted when thread 0 (logical processor 0) is executing at a CPL of 1, 2, or 3.
- **T0\_OS flag, bit 3** — When set, events are counted when thread 0 (logical processor 0) is executing at CPL of 0. (When both the T0\_OS and T0\_USR flags are set, thread 0 events are counted at all privilege levels.)
- **Tag enable, bit 4** — When set, enables tagging of  $\mu$ ops to assist in at-retirement event counting; when clear, disables tagging. See Section 18.6.3.6, “At-Retirement Counting.”
- **Tag value field, bits 5 through 8** — Selects a tag value to associate with a  $\mu$ op to assist in at-retirement event counting.
- **Event mask field, bits 9 through 24** — Selects events to be counted from the event class selected with the event select field.
- **Event select field, bits 25 through 30** — Selects a class of events to be counted. The events within this class that are counted are selected with the event mask field.

The T0\_OS and T0\_USR flags and the T1\_OS and T1\_USR flags allow event counting and sampling to be specified for a specific logical processor (0 or 1) within an Intel Xeon processor MP (See also: Section 8.4.5, “Identifying Logical Processors in an MP System,” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*).

Not all performance monitoring events can be detected within an Intel Xeon processor MP on a per logical processor basis (see Section 18.6.4.4, “Performance Monitoring Events”). Some sub-events (specified by an event mask bits) are counted or sampled without regard to which logical processor is associated with the detected event.

#### 18.6.4.2 CCCR MSRs

Figure 18-50 shows the layout of a CCCR MSR in processors supporting Intel Hyper-Threading Technology. The functions of the flags and fields are as follows:

- **Enable flag, bit 12** — When set, enables counting; when clear, the counter is disabled. This flag is cleared on reset
- **ESCR select field, bits 13 through 15** — Identifies the ESCR to be used to select events to be counted with the counter associated with the CCCR.
- **Active thread field, bits 16 and 17** — Enables counting depending on which logical processors are active (executing a thread). This field enables filtering of events based on the state (active or inactive) of the logical processors. The encodings of this field are as follows:
  - 00 — None. Count only when neither logical processor is active.
  - 01 — Single. Count only when one logical processor is active (either 0 or 1).
  - 10 — Both. Count only when both logical processors are active.
  - 11 — Any. Count when either logical processor is active.

A halted logical processor or a logical processor in the “wait for SIPI” state is considered inactive.
- **Compare flag, bit 18** — When set, enables filtering of the event count; when clear, disables filtering. The filtering method is selected with the threshold, complement, and edge flags.

**Figure 18-50. Counter Configuration Control Register (CCCR)**

- **Complement flag, bit 19** — Selects how the incoming event count is compared with the threshold value. When set, event counts that are less than or equal to the threshold value result in a single count being delivered to the performance counter; when clear, counts greater than the threshold value result in a count being delivered to the performance counter (see Section 18.6.3.5.2, “Filtering Events”). The compare flag is not active unless the compare flag is set.
- **Threshold field, bits 20 through 23** — Selects the threshold value to be used for comparisons. The processor examines this field only when the compare flag is set, and uses the complement flag setting to determine the type of threshold comparison to be made. The useful range of values that can be entered in this field depend on the type of event being counted (see Section 18.6.3.5.2, “Filtering Events”).
- **Edge flag, bit 24** — When set, enables rising edge (false-to-true) edge detection of the threshold comparison output for filtering event counts; when clear, rising edge detection is disabled. This flag is active only when the compare flag is set.
- **FORCE\_OVF flag, bit 25** — When set, forces a counter overflow on every counter increment; when clear, overflow only occurs when the counter actually overflows.
- **OVF\_PMI\_T0 flag, bit 26** — When set, causes a performance monitor interrupt (PMI) to be sent to logical processor 0 when the counter overflows occurs; when clear, disables PMI generation for logical processor 0. Note that the PMI is generate on the next event count after the counter has overflowed.
- **OVF\_PMI\_T1 flag, bit 27** — When set, causes a performance monitor interrupt (PMI) to be sent to logical processor 1 when the counter overflows occurs; when clear, disables PMI generation for logical processor 1. Note that the PMI is generate on the next event count after the counter has overflowed.
- **Cascade flag, bit 30** — When set, enables counting on one counter of a counter pair when its alternate counter in the other the counter pair in the same counter group overflows (see Section 18.6.3.2, “Performance Counters,” for further details); when clear, disables cascading of counters.
- **OVF flag, bit 31** — Indicates that the counter has overflowed when set. This flag is a sticky flag that must be explicitly cleared by software.

### 18.6.4.3 IA32\_PEBs\_ENABLE MSR

In a processor supporting Intel Hyper-Threading Technology and based on the Intel NetBurst microarchitecture, PEBs is enabled and qualified with two bits in the MSR\_PEBs\_ENABLE MSR: bit 25 (ENABLE\_PEBs\_MY\_THR) and 26 (ENABLE\_PEBs\_OTH\_THR) respectively. These bits do not explicitly identify a specific logical processor by logic

processor ID(T0 or T1); instead, they allow a software agent to enable PEBS for subsequent threads of execution on the same logical processor on which the agent is running (“my thread”) or for the other logical processor in the physical package on which the agent is not running (“other thread”).

PEBS is supported for only a subset of the at-retirement events: Execution\_event, Front\_end\_event, and Replay\_event. Also, PEBS can be carried out only with two performance counters: MSR\_IQ\_CCCR4 (MSR address 370H) for logical processor 0 and MSR\_IQ\_CCCR5 (MSR address 371H) for logical processor 1.

Performance monitoring tools should use a processor affinity mask to bind the kernel mode components that need to modify the ENABLE\_PEBS\_MY\_THR and ENABLE\_PEBS\_OTH\_THR bits in the MSR\_PEBS\_ENABLE MSR to a specific logical processor. This is to prevent these kernel mode components from migrating between different logical processors due to OS scheduling.

#### 18.6.4.4 Performance Monitoring Events

All of the events listed in Table 19-31 and 19-32 are available in an Intel Xeon processor MP. When Intel Hyper-Threading Technology is active, many performance monitoring events can be qualified by the logical processor ID, which corresponds to bit 0 of the initial APIC ID. This allows for counting an event in any or all of the logical processors. However, not all the events have this logic processor specificity, or thread specificity.

Here, each event falls into one of two categories:

- **Thread specific (TS)** — The event can be qualified as occurring on a specific logical processor.
- **Thread independent (TI)** — The event cannot be qualified as being associated with a specific logical processor.

Table 19-37 gives logical processor specific information (TS or TI) for each of the events described in Tables 19-31 and 19-32. If for example, a TS event occurred in logical processor T0, the counting of the event (as shown in Table 18-73) depends only on the setting of the T0\_USR and T0\_OS flags in the ESCR being used to set up the event counter. The T1\_USR and T1\_OS flags have no effect on the count.

**Table 18-73. Effect of Logical Processor and CPL Qualification  
for Logical-Processor-Specific (TS) Events**

|                   | T1_OS/T1_USR = 00            | T1_OS/T1_USR = 01   | T1_OS/T1_USR = 11   | T1_OS/T1_USR = 10  |
|-------------------|------------------------------|---|---|--|
| T0_OS/T0_USR = 00 | Zero count                   | Counts while T1 in USR                                      | Counts while T1 in OS or USR                                | Counts while T1 in OS                                      |
| T0_OS/T0_USR = 01 | Counts while T0 in USR       | Counts while T0 in USR or T1 in USR                         | Counts while (a) T0 in USR or (b) T1 in OS or (c) T1 in USR | Counts while (a) T0 in OS or (b) T1 in OS                  |
| T0_OS/T0_USR = 11 | Counts while T0 in OS or USR | Counts while (a) T0 in OS or (b) T0 in USR or (c) T1 in USR | Counts irrespective of CPL, T0, T1                          | Counts while (a) T0 in OS or (b) T0 in USR or (c) T1 in OS |
| T0_OS/T0_USR = 10 | Counts T0 in OS              | Counts T0 in OS or T1 in USR                                | Counts while (a) T0 in OS or (b) T1 in OS or (c) T1 in USR  | Counts while (a) T0 in OS or (b) T1 in OS                  |

When a bit in the event mask field is TI, the effect of specifying bit-0-3 of the associated ESCR are described in Table 15-6. For events that are marked as TI in Chapter 19, the effect of selectively specifying T0\_USR, T0\_OS, T1\_USR, T1\_OS bits is shown in Table 18-74.

**Table 18-74. Effect of Logical Processor and CPL Qualification for Non-logical-Processor-specific (TI) Events**

|                   | T1_OS/T1_USR = 00                           | T1_OS/T1_USR = 01                           | T1_OS/T1_USR = 11                  | T1_OS/T1_USR = 10                         |
|-------------------|---|---|------------------------------------|---|
| T0_OS/T0_USR = 00 | Zero count                                  | Counts while (a) T0 in USR or (b) T1 in USR | Counts irrespective of CPL, T0, T1 | Counts while (a) T0 in OS or (b) T1 in OS |
| T0_OS/T0_USR = 01 | Counts while (a) T0 in USR or (b) T1 in USR | Counts while (a) T0 in USR or (b) T1 in USR | Counts irrespective of CPL, T0, T1 | Counts irrespective of CPL, T0, T1        |
| T0_OS/T0_USR = 11 | Counts irrespective of CPL, T0, T1          | Counts irrespective of CPL, T0, T1          | Counts irrespective of CPL, T0, T1 | Counts irrespective of CPL, T0, T1        |
| T0_OS/T0_USR = 0  | Counts while (a) T0 in OS or (b) T1 in OS   | Counts irrespective of CPL, T0, T1          | Counts irrespective of CPL, T0, T1 | Counts while (a) T0 in OS or (b) T1 in OS |

### 18.6.4.5 Counting Clocks on systems with Intel Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture

#### 18.6.4.5.1 Non-Halted Clockticks

Use the following procedure to program ESCRs and CCCRs to obtain non-halted clockticks on processors based on Intel NetBurst microarchitecture:

1. Select an ESCR for the global\_power\_events and specify the RUNNING sub-event mask and the desired T0\_OS/T0\_USR/T1\_OS/T1\_USR bits for the targeted processor.
2. Select an appropriate counter.
3. Enable counting in the CCCR for that counter by setting the enable bit.

#### 18.6.4.5.2 Non-Sleep Clockticks

Performance monitoring counters can be configured to count clockticks whenever the performance monitoring hardware is not powered-down. To count Non-sleep Clockticks with a performance-monitoring counter, do the following:

1. Select one of the 18 counters.
2. Select any of the ESCRs whose events the selected counter can count. Set its event select to anything other than "no\_event"; the counter may be disabled if this is not done.
3. Turn threshold comparison on in the CCCR by setting the compare bit to "1".
4. Set the threshold to "15" and the complement to "1" in the CCCR. Since no event can exceed this threshold, the threshold condition is met every cycle and the counter counts every cycle. Note that this overrides any qualification (e.g. by CPL) specified in the ESCR.
5. Enable counting in the CCCR for the counter by setting the enable bit.

In most cases, the counts produced by the non-halted and non-sleep metrics are equivalent if the physical package supports one logical processor and is not placed in a power-saving state. Operating systems may execute an HLT instruction and place a physical processor in a power-saving state.

On processors that support Intel Hyper-Threading Technology (Intel HT Technology), each physical package can support two or more logical processors. Current implementation of Intel HT Technology provides two logical processors for each physical processor. While both logical processors can execute two threads simultaneously, one logical processor may halt to allow the other logical processor to execute without sharing execution resources between two logical processors.

Non-halted Clockticks can be set up to count the number of processor clock cycles for each logical processor whenever the logical processor is not halted (the count may include some portion of the clock cycles for that logical processor to complete a transition to a halted state). Physical processors that support Intel HT Technology enter into a power-saving state if all logical processors halt.

The Non-sleep Clockticks mechanism uses a filtering mechanism in CCCRs. The mechanism will continue to increment as long as one logical processor is not halted or in a power-saving state. Applications may cause a processor to enter into a power-saving state by using an OS service that transfers control to an OS's idle loop. The idle loop then may place the processor into a power-saving state after an implementation-dependent period if there is no work for the processor.

### 18.6.5 Performance Monitoring and Dual-Core Technology

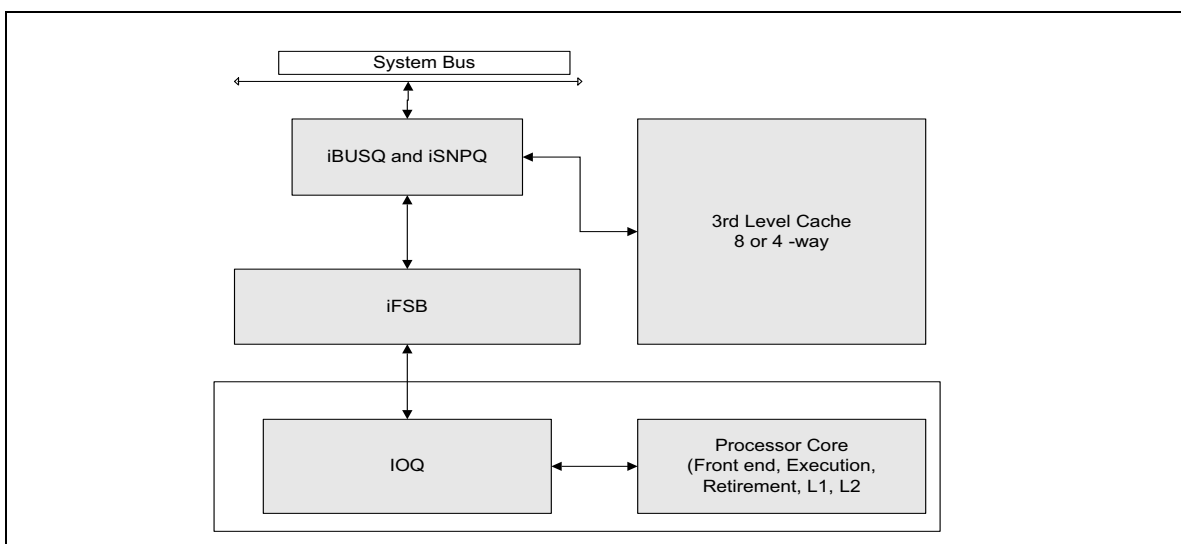

The performance monitoring capability of dual-core processors duplicates the microarchitectural resources of a single-core processor implementation. Each processor core has dedicated performance monitoring resources.

In the case of Pentium D processor, each logical processor is associated with dedicated resources for performance monitoring. In the case of Pentium processor Extreme edition, each processor core has dedicated resources, but two logical processors in the same core share performance monitoring resources (see Section 18.6.4, "Performance Monitoring and Intel Hyper-Threading Technology in Processors Based on Intel NetBurst® Microarchitecture").

### 18.6.6 Performance Monitoring on 64-bit Intel Xeon Processor MP with Up to 8-MByte L3 Cache

The 64-bit Intel Xeon processor MP with up to 8-MByte L3 cache has a CPUID signature of family [0FH], model [03H or 04H]. Performance monitoring capabilities available to Pentium 4 and Intel Xeon processors with the same values (see Section 18.1 and Section 18.6.4) apply to the 64-bit Intel Xeon processor MP with an L3 cache.

The level 3 cache is connected between the system bus and IOQ through additional control logic. See Figure 18-51.

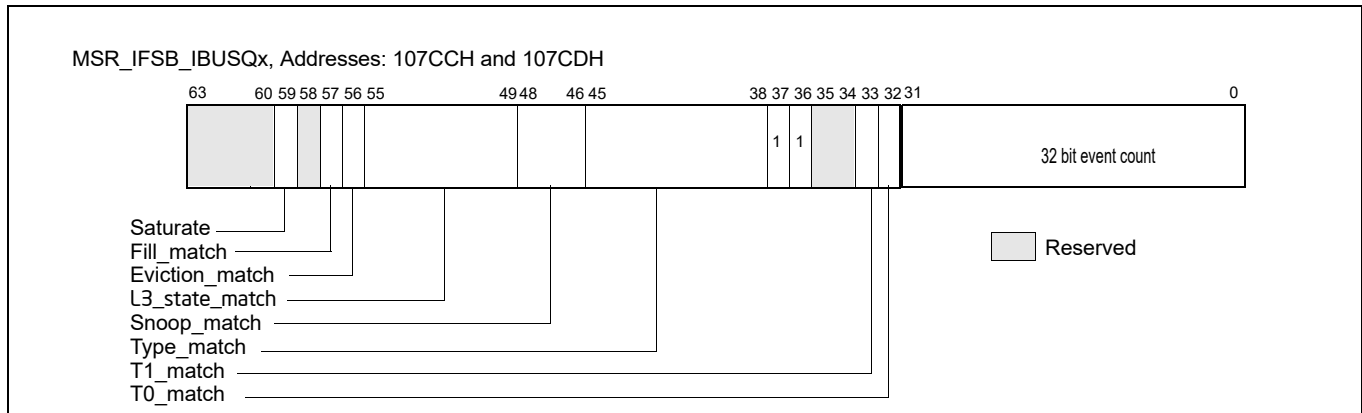

**Figure 18-51. Block Diagram of 64-bit Intel Xeon Processor MP with 8-MByte L3**

Additional performance monitoring capabilities and facilities unique to 64-bit Intel Xeon processor MP with an L3 cache are described in this section. The facility for monitoring events consists of a set of dedicated model-specific registers (MSRs), each dedicated to a specific event. Programming of these MSRs requires using RDMSR/WRMSR instructions with 64-bit values.

The lower 32-bits of the MSRs at addresses 107CC through 107D3 are treated as 32 bit performance counter registers. These performance counters can be accessed using RDPNC instruction with the index starting from 18 through 25. The EDX register returns zero when reading these 8 PMCs.

The performance monitoring capabilities consist of four events. These are:

- IBUSQ event** — This event detects the occurrence of micro-architectural conditions related to the iBUSQ unit. It provides two MSRs: MSR\_IFSB\_IBUSQ0 and MSR\_IFSB\_IBUSQ1. Configure sub-event qualification and enable/disable functions using the high 32 bits of these MSRs. The low 32 bits act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the upper 32 bits. See Figure 18-52.

**Figure 18-52. MSR\_IFSB\_IBUSQx, Addresses: 107CCH and 107CDH**

- ISNPQ event** — This event detects the occurrence of microarchitectural conditions related to the iSNPQ unit. It provides two MSRs: MSR\_IFSB\_ISNPQ0 and MSR\_IFSB\_ISNPQ1. Configure sub-event qualifications and enable/disable functions using the high 32 bits of the MSRs. The low 32-bits act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the upper 32-bits. See Figure 18-53.

**Figure 18-53. MSR\_IFSB\_ISNPQx, Addresses: 107CEH and 107CFH**

- EFSB event** — This event can detect the occurrence of micro-architectural conditions related to the iFSB unit or system bus. It provides two MSRs: MSR\_EFSB\_DRDY0 and MSR\_EFSB\_DRDY1. Configure sub-event qualifications and enable/disable functions using the high 32 bits of the 64-bit MSR. The low 32-bit act as a 32-bit event counter. Counting starts after software writes a non-zero value to one or more of the qualification bits in the upper 32-bits of the MSR. See Figure 18-54.

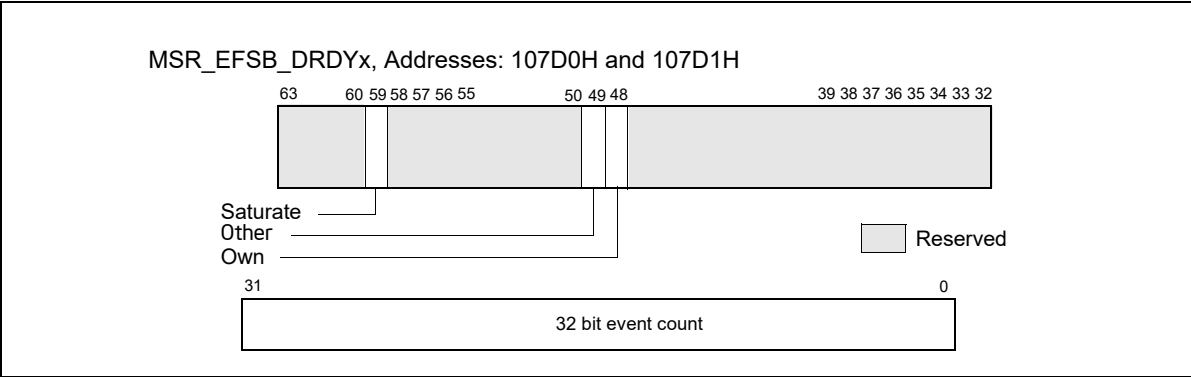

Figure 18-54. MSR\_EFSB\_DRDYx, Addresses: 107D0H and 107D1H

- **IBUSQ Latency event** — This event accumulates weighted cycle counts for latency measurement of transactions in the iBUSQ unit. The count is enabled by setting MSR\_IFSB\_CTRL6[bit 26] to 1; the count freezes after software sets MSR\_IFSB\_CTRL6[bit 26] to 0. MSR\_IFSB\_CNTR7 acts as a 64-bit event counter for this event. See Figure 18-55.

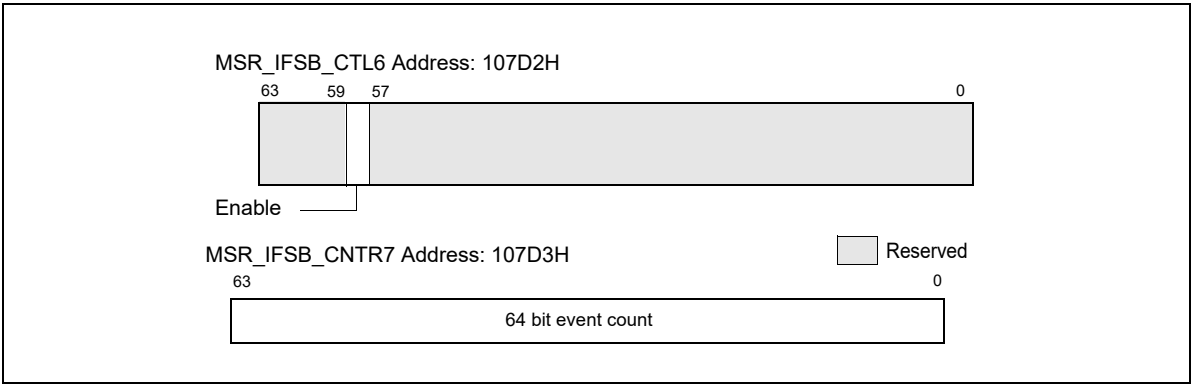

Figure 18-55. MSR\_IFSB\_CTL6, Address: 107D2H;  
MSR\_IFSB\_CNTR7, Address: 107D3H

### 18.6.7 Performance Monitoring on L3 and Caching Bus Controller Sub-Systems

The Intel Xeon processor 7400 series and Dual-Core Intel Xeon processor 7100 series employ a distinct L3/caching bus controller sub-system. These sub-system have a unique set of performance monitoring capability and programming interfaces that are largely common between these two processor families.

Intel Xeon processor 7400 series are based on 45 nm enhanced Intel Core microarchitecture. The CPUID signature is indicated by DisplayFamily\_DisplayModel value of 06\_1DH (see CPUID instruction in Chapter 3, “Instruction Set Reference, A-L” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2A*). Intel Xeon processor 7400 series have six processor cores that share an L3 cache.

Dual-Core Intel Xeon processor 7100 series are based on Intel NetBurst microarchitecture, have a CPUID signature of family [0FH], model [06H] and a unified L3 cache shared between two cores. Each core in an Intel Xeon processor 7100 series supports Intel Hyper-Threading Technology, providing two logical processors per core.

Both Intel Xeon processor 7400 series and Intel Xeon processor 7100 series support multi-processor configurations using system bus interfaces. In Intel Xeon processor 7400 series, the L3/caching bus controller sub-system provides three Simple Direct Interface (SDI) to service transactions originated the XQ-replacement SDI logic in each dual-core modules. In Intel Xeon processor 7100 series, the IOQ logic in each processor core is replaced with a Simple Direct Interface (SDI) logic. The L3 cache is connected between the system bus and the SDI through addi-

tional control logic. See Figure 18-56 for the block configuration of six processor cores and the L3/Caching bus controller sub-system in Intel Xeon processor 7400 series. Figure 18-56 shows the block configuration of two processor cores (four logical processors) and the L3/Caching bus controller sub-system in Intel Xeon processor 7100 series.

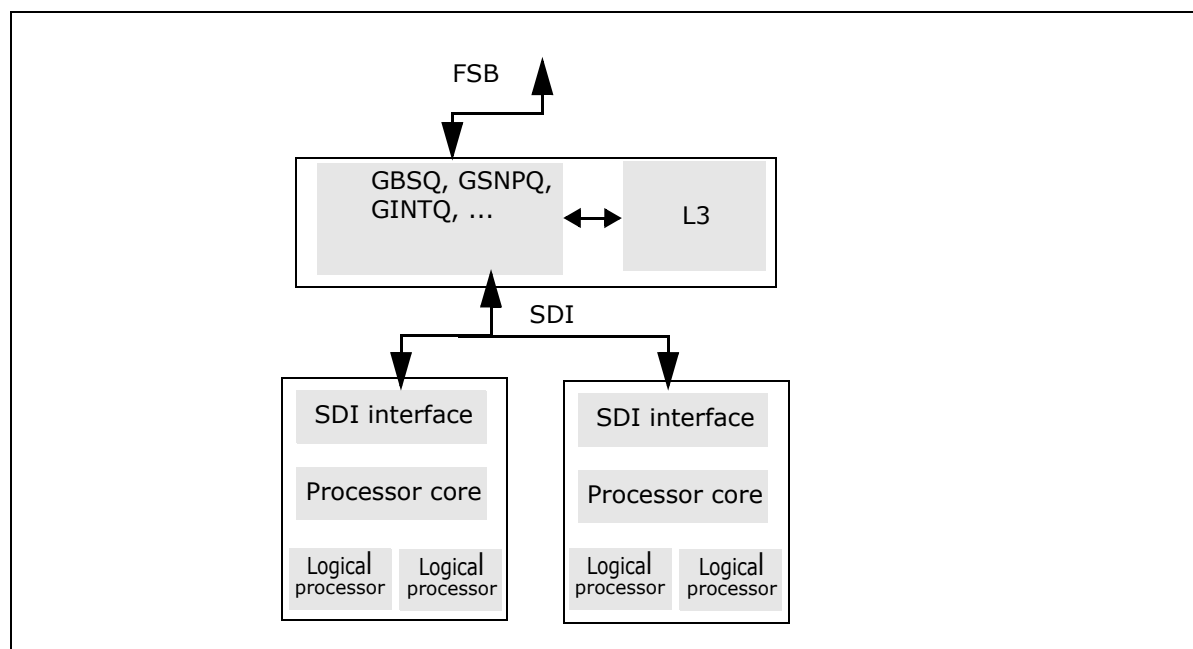

**Figure 18-56. Block Diagram of Intel Xeon Processor 7400 Series**

Almost all of the performance monitoring capabilities available to processor cores with the same CPUID signatures (see Section 18.1 and Section 18.6.4) apply to Intel Xeon processor 7100 series. The MSRs used by performance monitoring interface are shared between two logical processors in the same processor core.

The performance monitoring capabilities available to processor with DisplayFamily\_DisplayModel signature 06\_17H also apply to Intel Xeon processor 7400 series. Each processor core provides its own set of MSRs for performance monitoring interface.

The IOQ\_allocation and IOQ\_active\_entries events are not supported in Intel Xeon processor 7100 series and 7400 series. Additional performance monitoring capabilities applicable to the L3/caching bus controller sub-system are described in this section.

**Figure 18-57. Block Diagram of Intel Xeon Processor 7100 Series**

### 18.6.7.1 Overview of Performance Monitoring with L3/Caching Bus Controller

The facility for monitoring events consists of a set of dedicated model-specific registers (MSRs). There are eight event select/counting MSRs that are dedicated to counting events associated with specified microarchitectural conditions. Programming of these MSRs requires using RDMSR/WRMSR instructions with 64-bit values. In addition, an MSR MSR\_EMON\_L3\_GL\_CTL provides simplified interface to control freezing, resetting, re-enabling operation of any combination of these event select/counting MSRs.

The eight MSRs dedicated to count occurrences of specific conditions are further divided to count three sub-classes of microarchitectural conditions:

- Two MSRs (MSR\_EMON\_L3\_CTR\_CTL0 and MSR\_EMON\_L3\_CTR\_CTL1) are dedicated to counting GBSQ events. Up to two GBSQ events can be programmed and counted simultaneously.
- Two MSRs (MSR\_EMON\_L3\_CTR\_CTL2 and MSR\_EMON\_L3\_CTR\_CTL3) are dedicated to counting GSNPQ events. Up to two GBSQ events can be programmed and counted simultaneously.
- Four MSRs (MSR\_EMON\_L3\_CTR\_CTL4, MSR\_EMON\_L3\_CTR\_CTL5, MSR\_EMON\_L3\_CTR\_CTL6, and MSR\_EMON\_L3\_CTR\_CTL7) are dedicated to counting external bus operations.

The bit fields in each of eight MSRs share the following common characteristics:

- Bits 63:32 is the event control field that includes an event mask and other bit fields that control counter operation. The event mask field specifies details of the microarchitectural condition, and its definition differs across GBSQ, GSNPQ, FSB.
- Bits 31:0 is the event count field. If the specified condition is met during each relevant clock domain of the event logic, the matched condition signals the counter logic to increment the associated event count field. The lower 32-bits of these 8 MSRs at addresses 107CC through 107D3 are treated as 32 bit performance counter registers.

In Dual-Core Intel Xeon processor 7100 series, the uncore performance counters can be accessed using RDPMC instruction with the index starting from 18 through 25. The EDX register returns zero when reading these 8 PMCs.

In Intel Xeon processor 7400 series, RDPMC with ECX between 2 and 9 can be used to access the eight uncore performance counter/control registers.

### 18.6.7.2 GBSQ Event Interface

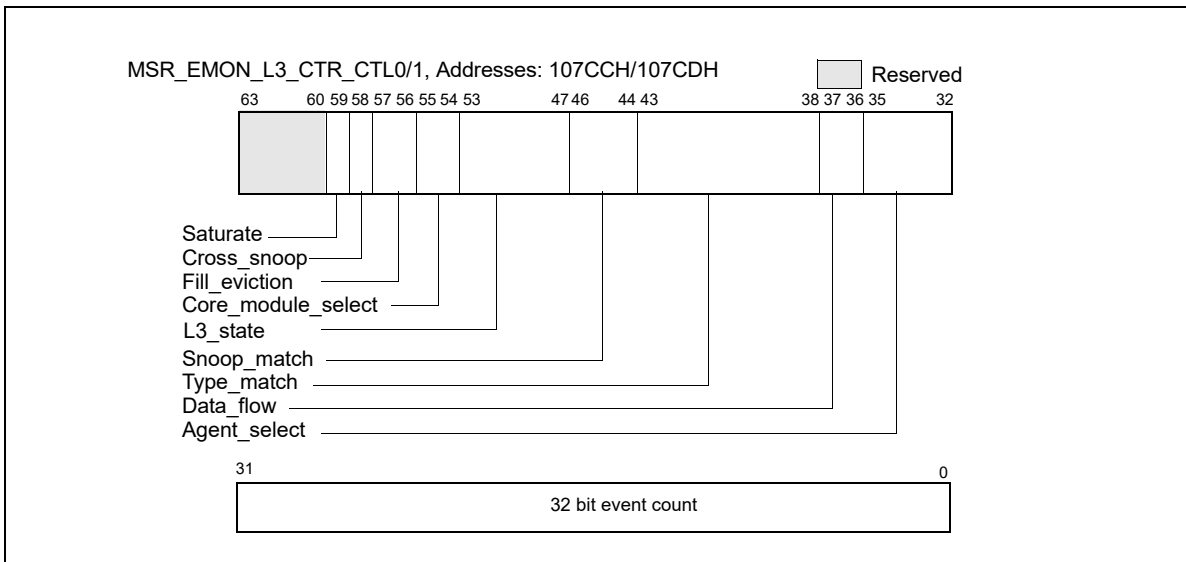

The layout of MSR\_EMON\_L3\_CTR\_CTL0 and MSR\_EMON\_L3\_CTR\_CTL1 is given in Figure 18-58. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) consists of the following eight attributes:

- **Agent\_Select (bits 35:32):** The definition of this field differs slightly between Intel Xeon processor 7100 and 7400.

For Intel Xeon processor 7100 series, each bit specifies a logical processor in the physical package. The lower two bits corresponds to two logical processors in the first processor core, the upper two bits corresponds to two logical processors in the second processor core. 0FH encoding matches transactions from any logical processor.

For Intel Xeon processor 7400 series, each bit of [34:32] specifies the SDI logic of a dual-core module as the originator of the transaction. A value of 0111B in bits [35:32] specifies transaction from any processor core.

**Figure 18-58. MSR\_EMON\_L3\_CTR\_CTL0/1, Addresses: 107CCH/107CDH**

- **Data\_Flow (bits 37:36):** Bit 36 specifies demand transactions, bit 37 specifies prefetch transactions.
- **Type\_Match (bits 43:38):** Specifies transaction types. If all six bits are set, event count will include all transaction types.
- **Snoop\_Match (bits 46:44):** The three bits specify (in ascending bit position) clean snoop result, HIT snoop result, and HITM snoop results respectively.
- **L3\_State (bits 53:47):** Each bit specifies an L2 coherency state.
- **Core\_Module\_Select (bits 55:54):** The valid encodings for L3 lookup differ slightly between Intel Xeon processor 7100 and 7400.

For Intel Xeon processor 7100 series,

- 00B: Match transactions from any core in the physical package
- 01B: Match transactions from this core only
- 10B: Match transactions from the other core in the physical package
- 11B: Match transaction from both cores in the physical package

For Intel Xeon processor 7400 series,

- 00B: Match transactions from any dual-core module in the physical package
- 01B: Match transactions from this dual-core module only
- 10B: Match transactions from either one of the other two dual-core modules in the physical package

- 11B: Match transaction from more than one dual-core modules in the physical package
- Fill\_Eviction (bits 57:56): The valid encodings are
  - 00B: Match any transactions
  - 01B: Match transactions that fill L3
  - 10B: Match transactions that fill L3 without an eviction
  - 11B: Match transaction fill L3 with an eviction
- Cross\_Snoop (bit 58): The encodings are \
  - 0B: Match any transactions
  - 1B: Match cross snoop transactions

For each counting clock domain, if all eight attributes match, event logic signals to increment the event count field.

### 18.6.7.3 GSNPQ Event Interface

The layout of MSR\_EMON\_L3\_CTR\_CTL2 and MSR\_EMON\_L3\_CTR\_CTL3 is given in Figure 18-59. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) consists of the following six attributes:

- Agent\_Select (bits 37:32): The definition of this field differs slightly between Intel Xeon processor 7100 and 7400.
- For Intel Xeon processor 7100 series, each of the lowest 4 bits specifies a logical processor in the physical package. The lowest two bits corresponds to two logical processors in the first processor core, the next two bits corresponds to two logical processors in the second processor core. Bit 36 specifies other symmetric agent transactions. Bit 37 specifies central agent transactions. 3FH encoding matches transactions from any logical processor.  
For Intel Xeon processor 7400 series, each of the lowest 3 bits specifies a dual-core module in the physical package. Bit 37 specifies central agent transactions.
- Type\_Match (bits 43:38): Specifies transaction types. If all six bits are set, event count will include any transaction types.
- Snoop\_Match: (bits 46:44): The three bits specify (in ascending bit position) clean snoop result, HIT snoop result, and HITM snoop results respectively.
- L2\_State (bits 53:47): Each bit specifies an L3 coherency state.
- Core\_Module\_Select (bits 56:54): Bit 56 enables Core\_Module\_Select matching. If bit 56 is clear, Core\_Module\_Select encoding is ignored. The valid encodings for the lower two bits (bit 55, 54) differ slightly between Intel Xeon processor 7100 and 7400.

For Intel Xeon processor 7100 series, if bit 56 is set, the valid encodings for the lower two bits (bit 55, 54) are

- 00B: Match transactions from only one core (irrespective which core) in the physical package
- 01B: Match transactions from this core and not the other core
- 10B: Match transactions from the other core in the physical package, but not this core
- 11B: Match transaction from both cores in the physical package

For Intel Xeon processor 7400 series, if bit 56 is set, the valid encodings for the lower two bits (bit 55, 54) are

- 00B: Match transactions from only one dual-core module (irrespective which module) in the physical package.
- 01B: Match transactions from one or more dual-core modules.
- 10B: Match transactions from two or more dual-core modules.
- 11B: Match transaction from all three dual-core modules in the physical package.

- Block\_Snoop (bit 57): specifies blocked snoop.

For each counting clock domain, if all six attributes match, event logic signals to increment the event count field.

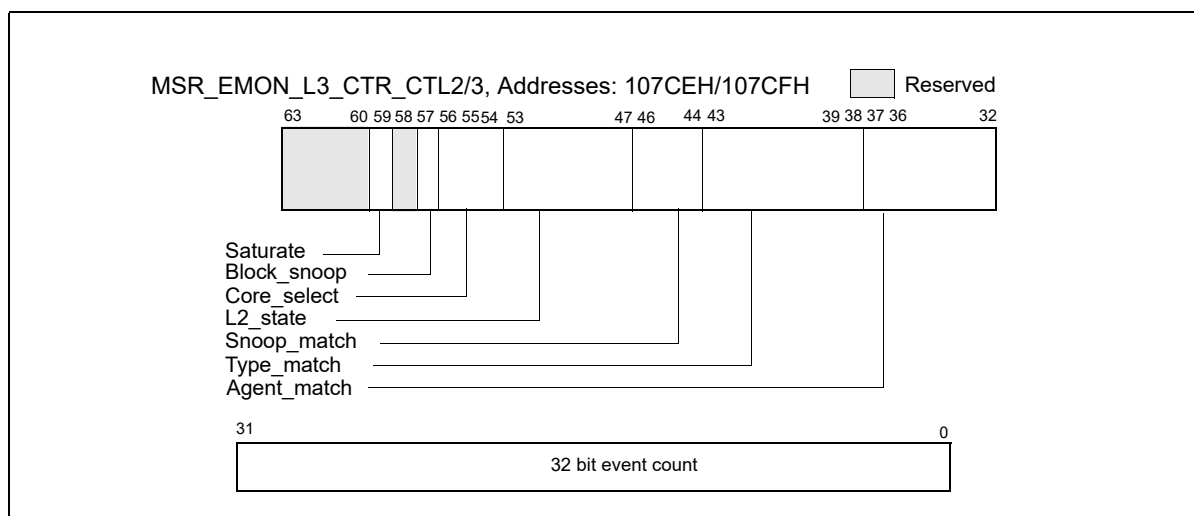

Figure 18-59. MSR\_EMON\_L3\_CTR\_CTL2/3, Addresses: 107CEH/107CFH

#### 18.6.7.4 FSB Event Interface

The layout of MSR\_EMON\_L3\_CTR\_CTL4 through MSR\_EMON\_L3\_CTR\_CTL7 is given in Figure 18-60. Counting starts after software writes a non-zero value to one or more of the upper 32 bits.

The event mask field (bits 58:32) is organized as follows:

- Bit 58: must set to 1.
- FSB\_Submask (bits 57:32): Specifies FSB-specific sub-event mask.

The FSB sub-event mask defines a set of independent attributes. The event logic signals to increment the associated event count field if one of the attribute matches. Some of the sub-event mask bit counts durations. A duration event increments at most once per cycle.

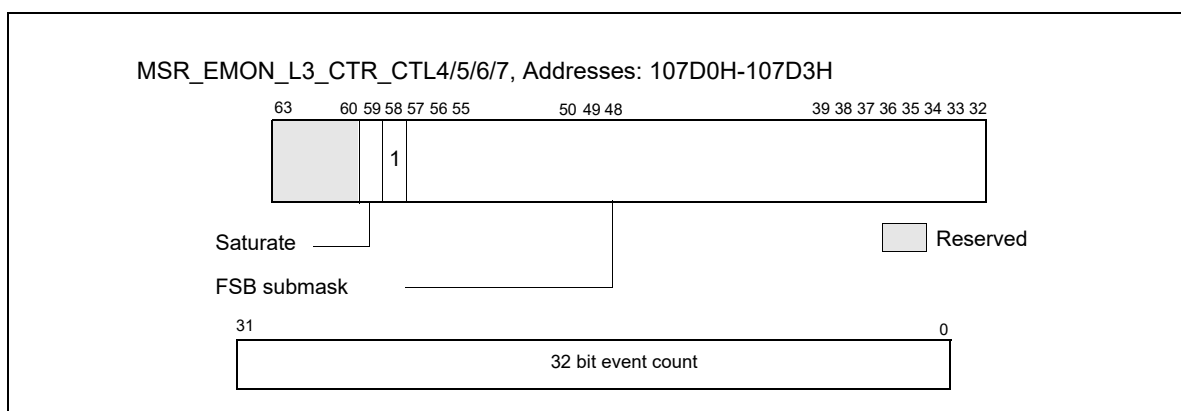

Figure 18-60. MSR\_EMON\_L3\_CTR\_CTL4/5/6/7, Addresses: 107D0H-107D3H

##### 18.6.7.4.1 FSB Sub-Event Mask Interface

- FSB\_type (bit 37:32): Specifies different FSB transaction types originated from this physical package.
- FSB\_L\_clear (bit 38): Count clean snoop results from any source for transaction originated from this physical package.
- FSB\_L\_hit (bit 39): Count HIT snoop results from any source for transaction originated from this physical package.

- FSB\_L\_hitm (bit 40): Count HITM snoop results from any source for transaction originated from this physical package.
- FSB\_L\_defer (bit 41): Count DEFER responses to this processor's transactions.
- FSB\_L\_retry (bit 42): Count RETRY responses to this processor's transactions.
- FSB\_L\_snoop\_stall (bit 43): Count snoop stalls to this processor's transactions.
- FSB\_DBSY (bit 44): Count DBSY assertions by this processor (without a concurrent DRDY).
- FSB\_DRDY (bit 45): Count DRDY assertions by this processor.
- FSB\_BNR (bit 46): Count BNR assertions by this processor.
- FSB\_IOQ\_empty (bit 47): Counts each bus clocks when the IOQ is empty.
- FSB\_IOQ\_full (bit 48): Counts each bus clocks when the IOQ is full.
- FSB\_IOQ\_active (bit 49): Counts each bus clocks when there is at least one entry in the IOQ.
- FSB\_WW\_data (bit 50): Counts back-to-back write transaction's data phase.
- FSB\_WW\_issue (bit 51): Counts back-to-back write transaction request pairs issued by this processor.
- FSB\_WR\_issue (bit 52): Counts back-to-back write-read transaction request pairs issued by this processor.
- FSB\_RW\_issue (bit 53): Counts back-to-back read-write transaction request pairs issued by this processor.
- FSB\_other\_DBSY (bit 54): Count DBSY assertions by another agent (without a concurrent DRDY).
- FSB\_other\_DRDY (bit 55): Count DRDY assertions by another agent.
- FSB\_other\_snoop\_stall (bit 56): Count snoop stalls on the FSB due to another agent.
- FSB\_other\_BNR (bit 57): Count BNR assertions from another agent.

#### 18.6.7.5 Common Event Control Interface

The MSR\_EMON\_L3\_GL\_CTL MSR provides simplified access to query overflow status of the GBSQ, GSNPQ, FSB event counters. It also provides control bit fields to freeze, unfreeze, or reset those counters. The following bit fields are supported:

- GL\_freeze\_cmd (bit 0): Freeze the event counters specified by the GL\_event\_select field.
- GL\_unfreeze\_cmd (bit 1): Unfreeze the event counters specified by the GL\_event\_select field.
- GL\_reset\_cmd (bit 2): Clear the event count field of the event counters specified by the GL\_event\_select field. The event select field is not affected.
- GL\_event\_select (bit 23:16): Selects one or more event counters to subject to specified command operations indicated by bits 2:0. Bit 16 corresponds to MSR\_EMON\_L3\_CTR\_CTL0, bit 23 corresponds to MSR\_EMON\_L3\_CTR\_CTL7.
- GL\_event\_status (bit 55:48): Indicates the overflow status of each event counters. Bit 48 corresponds to MSR\_EMON\_L3\_CTR\_CTL0, bit 55 corresponds to MSR\_EMON\_L3\_CTR\_CTL7.

In the event control field (bits 63:32) of each MSR, if the saturate control (bit 59, see Figure 18-58 for example) is set, the event logic forces the value FFFF\_FFFFH into the event count field instead of incrementing it.

### 18.6.8 Performance Monitoring (P6 Family Processor)

The P6 family processors provide two 40-bit performance counters, allowing two types of events to be monitored simultaneously. These can either count events or measure duration. When counting events, a counter increments each time a specified event takes place or a specified number of events takes place. When measuring duration, it counts the number of processor clocks that occur while a specified condition is true. The counters can count events or measure durations that occur at any privilege level.

Table 19-40, Chapter 19, lists the events that can be counted with the P6 family performance monitoring counters.

**NOTE**

The performance-monitoring events listed in Chapter 19 are intended to be used as guides for performance tuning. Counter values reported are not guaranteed to be accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

The performance-monitoring counters are supported by four MSRs: the performance event select MSRs (PerfEvtSel0 and PerfEvtSel1) and the performance counter MSRs (PerfCtr0 and PerfCtr1). These registers can be read from and written to using the RDMSR and WRMSR instructions, respectively. They can be accessed using these instructions only when operating at privilege level 0. The PerfCtr0 and PerfCtr1 MSRs can be read from any privilege level using the RDPMC (read performance-monitoring counters) instruction.

**NOTE**

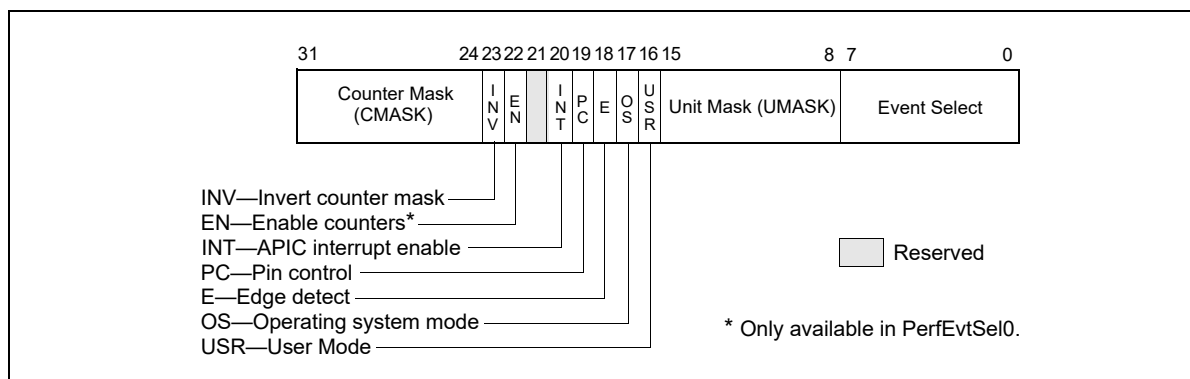

The PerfEvtSel0, PerfEvtSel1, PerfCtr0, and PerfCtr1 MSRs and the events listed in Table 19-40 are model-specific for P6 family processors. They are not guaranteed to be available in other IA-32 processors.

### 18.6.8.1 PerfEvtSel0 and PerfEvtSel1 MSRs

The PerfEvtSel0 and PerfEvtSel1 MSRs control the operation of the performance-monitoring counters, with one register used to set up each counter. They specify the events to be counted, how they should be counted, and the privilege levels at which counting should take place. Figure 18-61 shows the flags and fields in these MSRs.

The functions of the flags and fields in the PerfEvtSel0 and PerfEvtSel1 MSRs are as follows:

- **Event select field (bits 0 through 7)** — Selects the event logic unit to detect certain microarchitectural conditions (see Table 19-40, for a list of events and their 8-bit codes).
- **Unit mask (UMASK) field (bits 8 through 15)** — Further qualifies the event logic unit selected in the event select field to detect a specific microarchitectural condition. For example, for some cache events, the mask is used as a MESI-protocol qualifier of cache states (see Table 19-40).

**Figure 18-61. PerfEvtSel0 and PerfEvtSel1 MSRs**

- **USR (user mode) flag (bit 16)** — Specifies that events are counted only when the processor is operating at privilege levels 1, 2 or 3. This flag can be used in conjunction with the OS flag.
- **OS (operating system mode) flag (bit 17)** — Specifies that events are counted only when the processor is operating at privilege level 0. This flag can be used in conjunction with the USR flag.
- **E (edge detect) flag (bit 18)** — Enables (when set) edge detection of events. The processor counts the number of deasserted to asserted transitions of any condition that can be expressed by the other fields. The mechanism is limited in that it does not permit back-to-back assertions to be distinguished. This mechanism allows software to measure not only the fraction of time spent in a particular state, but also the average length of time spent in such a state (for example, the time spent waiting for an interrupt to be serviced).

- **PC (pin control) flag (bit 19)** — When set, the processor toggles the PM/ pins and increments the counter when performance-monitoring events occur; when clear, the processor toggles the PM/ pins when the counter overflows. The toggling of a pin is defined as assertion of the pin for a single bus clock followed by deassertion.
- **INT (APIC interrupt enable) flag (bit 20)** — When set, the processor generates an exception through its local APIC on counter overflow.
- **EN (Enable Counters) Flag (bit 22)** — This flag is only present in the PerfEvtSel0 MSR. When set, performance counting is enabled in both performance-monitoring counters; when clear, both counters are disabled.
- **INV (invert) flag (bit 23)** — When set, inverts the counter-mask (CMASK) comparison, so that both greater than or equal to and less than comparisons can be made (0: greater than or equal; 1: less than). Note if counter-mask is programmed to zero, INV flag is ignored.
- **Counter mask (CMASK) field (bits 24 through 31)** — When nonzero, the processor compares this mask to the number of events counted during a single cycle. If the event count is greater than or equal to this mask, the counter is incremented by one. Otherwise the counter is not incremented. This mask can be used to count events only if multiple occurrences happen per clock (for example, two or more instructions retired per clock). If the counter-mask field is 0, then the counter is incremented each cycle by the number of events that occurred that cycle.

### 18.6.8.2 PerfCtr0 and PerfCtr1 MSRs

The performance-counter MSRs (PerfCtr0 and PerfCtr1) contain the event or duration counts for the selected events being counted. The RDPMC instruction can be used by programs or procedures running at any privilege level and in virtual-8086 mode to read these counters. The PCE flag in control register CR4 (bit 8) allows the use of this instruction to be restricted to only programs and procedures running at privilege level 0.

The RDPMC instruction is not serializing or ordered with other instructions. Thus, it does not necessarily wait until all previous instructions have been executed before reading the counter. Similarly, subsequent instructions may begin execution before the RDPMC instruction operation is performed.

Only the operating system, executing at privilege level 0, can directly manipulate the performance counters, using the RDMSR and WRMSR instructions. A secure operating system would clear the PCE flag during system initialization to disable direct user access to the performance-monitoring counters, but provide a user-accessible programming interface that emulates the RDPMC instruction.

The WRMSR instruction cannot arbitrarily write to the performance-monitoring counter MSRs (PerfCtr0 and PerfCtr1). Instead, the lower-order 32 bits of each MSR may be written with any value, and the high-order 8 bits are sign-extended according to the value of bit 31. This operation allows writing both positive and negative values to the performance counters.

### 18.6.8.3 Starting and Stopping the Performance-Monitoring Counters

The performance-monitoring counters are started by writing valid setup information in the PerfEvtSel0 and/or PerfEvtSel1 MSRs and setting the enable counters flag in the PerfEvtSel0 MSR. If the setup is valid, the counters begin counting following the execution of a WRMSR instruction that sets the enable counter flag. The counters can be stopped by clearing the enable counters flag or by clearing all the bits in the PerfEvtSel0 and PerfEvtSel1 MSRs. Counter 1 alone can be stopped by clearing the PerfEvtSel1 MSR.

### 18.6.8.4 Event and Time-Stamp Monitoring Software

To use the performance-monitoring counters and time-stamp counter, the operating system needs to provide an event-monitoring device driver. This driver should include procedures for handling the following operations:

- Feature checking.
- Initialize and start counters.
- Stop counters.
- Read the event counters.
- Read the time-stamp counter.

The event monitor feature determination procedure must check whether the current processor supports the performance-monitoring counters and time-stamp counter. This procedure compares the family and model of the processor returned by the CPUID instruction with those of processors known to support performance monitoring. (The Pentium and P6 family processors support performance counters.) The procedure also checks the MSR and TSC flags returned to register EDX by the CPUID instruction to determine if the MSRs and the RDTSC instruction are supported.

The initialize and start counters procedure sets the PerfEvtSel0 and/or PerfEvtSel1 MSRs for the events to be counted and the method used to count them and initializes the counter MSRs (PerfCtr0 and PerfCtr1) to starting counts. The stop counters procedure stops the performance counters (see Section 18.6.8.3, “Starting and Stopping the Performance-Monitoring Counters”).

The read counters procedure reads the values in the PerfCtr0 and PerfCtr1 MSRs, and a read time-stamp counter procedure reads the time-stamp counter. These procedures would be provided in lieu of enabling the RDTSC and RDPMC instructions that allow application code to read the counters.

### 18.6.8.5 Monitoring Counter Overflow

The P6 family processors provide the option of generating a local APIC interrupt when a performance-monitoring counter overflows. This mechanism is enabled by setting the interrupt enable flag in either the PerfEvtSel0 or the PerfEvtSel1 MSR. The primary use of this option is for statistical performance sampling.

To use this option, the operating system should do the following things on the processor for which performance events are required to be monitored:

- Provide an interrupt vector for handling the counter-overflow interrupt.
- Initialize the APIC PERF local vector entry to enable handling of performance-monitor counter overflow events.
- Provide an entry in the IDT that points to a stub exception handler that returns without executing any instructions.
- Provide an event monitor driver that provides the actual interrupt handler and modifies the reserved IDT entry to point to its interrupt routine.

When interrupted by a counter overflow, the interrupt handler needs to perform the following actions:

- Save the instruction pointer (EIP register), code-segment selector, TSS segment selector, counter values and other relevant information at the time of the interrupt.
- Reset the counter to its initial setting and return from the interrupt.

An event monitor application utility or another application program can read the information collected for analysis of the performance of the profiled application.

## 18.6.9 Performance Monitoring (Pentium Processors)

The Pentium processor provides two 40-bit performance counters, which can be used to count events or measure duration. The counters are supported by three MSRs: the control and event select MSR (CESR) and the performance counter MSRs (CTR0 and CTR1). These can be read from and written to using the RDMSR and WRMSR instructions, respectively. They can be accessed using these instructions only when operating at privilege level 0.

Each counter has an associated external pin (PM0/BP0 and PM1/BP1), which can be used to indicate the state of the counter to external hardware.

### NOTES

The CESR, CTR0, and CTR1 MSRs and the events listed in Table 19-41 are model-specific for the Pentium processor.

The performance-monitoring events listed in Chapter 19 are intended to be used as guides for performance tuning. Counter values reported are not guaranteed to be accurate and should be used as a relative guide for tuning. Known discrepancies are documented where applicable.

18.6.9.1 Control and Event Select Register (CESR)

The 32-bit control and event select MSR (CESR) controls the operation of performance-monitoring counters CTR0 and CTR1 and the associated pins (see Figure 18-62). To control each counter, the CESR register contains a 6-bit event select field (ES0 and ES1), a pin control flag (PC0 and PC1), and a 3-bit counter control field (CC0 and CC1). The functions of these fields are as follows:

- **ES0 and ES1 (event select) fields (bits 0-5, bits 16-21)** — Selects (by entering an event code in the field) up to two events to be monitored. See Table 19-41 for a list of available event codes.

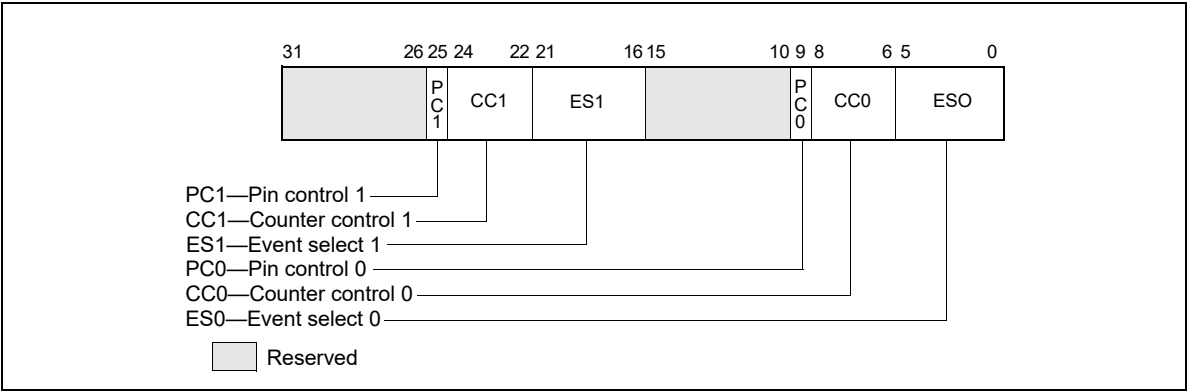

Figure 18-62. CESR MSR (Pentium Processor Only)

- **CC0 and CC1 (counter control) fields (bits 6-8, bits 22-24)** — Controls the operation of the counter. Control codes are as follows:

- 000 — Count nothing (counter disabled).
- 001 — Count the selected event while CPL is 0, 1, or 2.
- 010 — Count the selected event while CPL is 3.
- 011 — Count the selected event regardless of CPL.
- 100 — Count nothing (counter disabled).
- 101 — Count clocks (duration) while CPL is 0, 1, or 2.
- 110 — Count clocks (duration) while CPL is 3.
- 111 — Count clocks (duration) regardless of CPL.

The highest order bit selects between counting events and counting clocks (duration); the middle bit enables counting when the CPL is 3; and the low-order bit enables counting when the CPL is 0, 1, or 2.

- **PC0 and PC1 (pin control) flags (bits 9, 25)** — Selects the function of the external performance-monitoring counter pin (PM0/BP0 and PM1/BP1). Setting one of these flags to 1 causes the processor to assert its associated pin when the counter has overflowed; setting the flag to 0 causes the pin to be asserted when the counter has been incremented. These flags permit the pins to be individually programmed to indicate the overflow or incremented condition. The external signalling of the event on the pins will lag the internal event by a few clocks as the signals are latched and buffered.

While a counter need not be stopped to sample its contents, it must be stopped and cleared or preset before switching to a new event. It is not possible to set one counter separately. If only one event needs to be changed, the CESR register must be read, the appropriate bits modified, and all bits must then be written back to CESR. At reset, all bits in the CESR register are cleared.

18.6.9.2 Use of the Performance-Monitoring Pins

When performance-monitor pins PM0/BP0 and/or PM1/BP1 are configured to indicate when the performance-monitor counter has incremented and an “occurrence event” is being counted, the associated pin is asserted (high) each time the event occurs. When a “duration event” is being counted, the associated PM pin is asserted for the

entire duration of the event. When the performance-monitor pins are configured to indicate when the counter has overflowed, the associated PM pin is asserted when the counter has overflowed.

When the PM0/BP0 and/or PM1/BP1 pins are configured to signal that a counter has incremented, it should be noted that although the counters may increment by 1 or 2 in a single clock, the pins can only indicate that the event occurred. Moreover, since the internal clock frequency may be higher than the external clock frequency, a single external clock may correspond to multiple internal clocks.

A “count up to” function may be provided when the event pin is programmed to signal an overflow of the counter. Because the counters are 40 bits, a carry out of bit 39 indicates an overflow. A counter may be preset to a specific value less than  $2^{40} - 1$ . After the counter has been enabled and the prescribed number of events has transpired, the counter will overflow.

Approximately 5 clocks later, the overflow is indicated externally and appropriate action, such as signaling an interrupt, may then be taken.

The PM0/BP0 and PM1/BP1 pins also serve to indicate breakpoint matches during in-circuit emulation, during which time the counter increment or overflow function of these pins is not available. After RESET, the PM0/BP0 and PM1/BP1 pins are configured for performance monitoring, however a hardware debugger may reconfigure these pins to indicate breakpoint matches.

### 18.6.9.3 Events Counted

Events that performance-monitoring counters can be set to count and record (using CTR0 and CTR1) are divided in two categories: occurrence and duration:

- **Occurrence events** — Counts are incremented each time an event takes place. If PM0/BP0 or PM1/BP1 pins are used to indicate when a counter increments, the pins are asserted each clock counters increment. But if an event happens twice in one clock, the counter increments by 2 (the pins are asserted only once).
- **Duration events** — Counters increment the total number of clocks that the condition is true. When used to indicate when counters increment, PM0/BP0 and/or PM1/BP1 pins are asserted for the duration.

## 18.7 COUNTING CLOCKS

The count of cycles, also known as clockticks, forms the basis for measuring how long a program takes to execute. Clockticks are also used as part of efficiency ratios like cycles per instruction (CPI). Processor clocks may stop ticking under circumstances like the following:

- The processor is halted when there is nothing for the CPU to do. For example, the processor may halt to save power while the computer is servicing an I/O request. When Intel Hyper-Threading Technology is enabled, both logical processors must be halted for performance-monitoring counters to be powered down.
- The processor is asleep as a result of being halted or because of a power-management scheme. There are different levels of sleep. In the some deep sleep levels, the time-stamp counter stops counting.

In addition, processor core clocks may undergo transitions at different ratios relative to the processor's bus clock frequency. Some of the situations that can cause processor core clock to undergo frequency transitions include:

- TM2 transitions.
- Enhanced Intel SpeedStep Technology transitions (P-state transitions).

For Intel processors that support TM2, the processor core clocks may operate at a frequency that differs from the Processor Base frequency (as indicated by processor frequency information reported by CPUID instruction). See Section 18.7.2 for more detail.

Due to the above considerations there are several important clocks referenced in this manual:

- **Base Clock** — The frequency of this clock is the frequency of the processor when the processor is not in turbo mode, and not being throttled via Intel SpeedStep.
- **Maximum Clock** — This is the maximum frequency of the processor when turbo mode is at the highest point.
- **Bus Clock** — These clockticks increment at a fixed frequency and help coordinate the bus on some systems.

- **Core Crystal Clock** — This is a clock that runs at fixed frequency; it coordinates the clocks on all packages across the system.
- **Non-halted Clockticks** — Measures clock cycles in which the specified logical processor is not halted and is not in any power-saving state. When Intel Hyper-Threading Technology is enabled, ticks can be measured on a per-logical-processor basis. There are also performance events on dual-core processors that measure clockticks per logical processor when the processor is not halted.
- **Non-sleep Clockticks** — Measures clock cycles in which the specified physical processor is not in a sleep mode or in a power-saving state. These ticks cannot be measured on a logical-processor basis.
- **Time-stamp Counter** — See Section 17.17, “Time-Stamp Counter”.
- **Reference Clockticks** — TM2 or Enhanced Intel SpeedStep technology are two examples of processor features that can cause processor core clockticks to represent non-uniform tick intervals due to change of bus ratios. Performance events that counts clockticks of a constant reference frequency was introduced Intel Core Duo and Intel Core Solo processors. The mechanism is further enhanced on processors based on Intel Core microarchitecture.

Some processor models permit clock cycles to be measured when the physical processor is not in deep sleep (by using the time-stamp counter and the RDTSC instruction). Note that such ticks cannot be measured on a per-logical-processor basis. See Section 17.17, “Time-Stamp Counter,” for detail on processor capabilities.

The first two methods use performance counters and can be set up to cause an interrupt upon overflow (for sampling). They may also be useful where it is easier for a tool to read a performance counter than to use a time stamp counter (the timestamp counter is accessed using the RDTSC instruction).

For applications with a significant amount of I/O, there are two ratios of interest:

- **Non-halted CPI** — Non-halted clockticks/instructions retired measures the CPI for phases where the CPU was being used. This ratio can be measured on a logical-processor basis when Intel Hyper-Threading Technology is enabled.
- **Nominal CPI** — Time-stamp counter ticks/instructions retired measures the CPI over the duration of a program, including those periods when the machine halts while waiting for I/O.

### 18.7.1 Non-Halted Reference Clockticks

Software can use UnHalted Reference Cycles on either a general purpose performance counter using event mask 0x3C and umask 0x01 or on fixed function performance counter 2 to count at a constant rate. These events count at a consistent rate irrespective of P-state, TM2, or frequency transitions that may occur to the processor. The UnHalted Reference Cycles event may count differently on the general purpose event and fixed counter.

### 18.7.2 Cycle Counting and Opportunistic Processor Operation

As a result of the state transitions due to opportunistic processor performance operation (see Chapter 14, “Power and Thermal Management”), a logical processor or a processor core can operate at frequency different from the Processor Base frequency.

The following items are expected to hold true irrespective of when opportunistic processor operation causes state transitions:

- The time stamp counter operates at a fixed-rate frequency of the processor.
- The IA32\_MPERF counter increments at a fixed frequency irrespective of any transitions caused by opportunistic processor operation.
- The IA32\_FIXED\_CTR2 counter increments at the same TSC frequency irrespective of any transitions caused by opportunistic processor operation.
- The Local APIC timer operation is unaffected by opportunistic processor operation.
- The TSC, IA32\_MPERF, and IA32\_FIXED\_CTR2 operate at close to the maximum non-turbo frequency, which is equal to the product of scalable bus frequency and maximum non-turbo ratio.

### 18.7.3 Determining the Processor Base Frequency

For Intel processors in which the nominal core crystal clock frequency is enumerated in CPUID.15H.ECX and the core crystal clock ratio is encoded in CPUID.15H (see Table 3-8 “Information Returned by CPUID Instruction”), the nominal TSC frequency can be determined by using the following equation:

$$\text{Nominal TSC frequency} = (\text{CPUID.15H.ECX}[31:0] * \text{CPUID.15H.EBX}[31:0]) \div \text{CPUID.15H.EAX}[31:0]$$

For Intel processors in which CPUID.15H.EBX[31:0]  $\div$  CPUID.0x15.EAX[31:0] is enumerated but CPUID.15H.ECX is not enumerated, Table 18-75 can be used to look up the nominal core crystal clock frequency.

**Table 18-75. Nominal Core Crystal Clock Frequency**

| Processor Families/Processor Number Series <sup>1</sup>   | Nominal Core Crystal Clock Frequency |
|---|--------------------------------------|
| Future Intel® Xeon® processors with CPUID signature 06_55H.   | 25 MHz                               |
| 6th and 7th generation Intel® Core™ processors (does not include Intel® Xeon® processors).  | 24 MHz                               |
| Next Generation Intel® Atom™ processors based on Goldmont Microarchitecture with CPUID signature 06_5CH (does not include Intel Xeon processors). | 19.2 MHz                             |

#### NOTES:

1. For any processor in which CPUID.15H is enumerated and MSR\_PLATFORM\_INFO[15:8] (which gives the scalable bus frequency) is available, a more accurate frequency can be obtained by using CPUID.15H.

#### 18.7.3.1 For Intel® Processors Based on Microarchitecture Code Name Sandy Bridge, Ivy Bridge, Haswell and Broadwell

The scalable bus frequency is encoded in the bit field MSR\_PLATFORM\_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by a bus speed of 100 MHz.

#### 18.7.3.2 For Intel® Processors Based on Microarchitecture Code Name Nehalem

The scalable bus frequency is encoded in the bit field MSR\_PLATFORM\_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by a bus speed of 133.33 MHz.

#### 18.7.3.3 For Intel® Atom™ Processors Based on the Silvermont Microarchitecture (Including Intel Processors Based on Airmont Microarchitecture)

The scalable bus frequency is encoded in the bit field MSR\_PLATFORM\_INFO[15:8] and the nominal TSC frequency can be determined by multiplying this number by the scalable bus frequency. The scalable bus frequency is encoded in the bit field MSR\_FSB\_FREQ[2:0] for Intel Atom processors based on the Silvermont microarchitecture, and in bit field MSR\_FSB\_FREQ[3:0] for processors based on the Airmont microarchitecture; see Chapter 2, “Model-Specific Registers (MSRs)” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4*.

#### 18.7.3.4 For Intel® Core™ 2 Processor Family and for Intel® Xeon® Processors Based on Intel Core Microarchitecture

For processors based on Intel Core microarchitecture, the scalable bus frequency is encoded in the bit field MSR\_FSB\_FREQ[2:0] at (0CDH), see Chapter 2, “Model-Specific Registers (MSRs)” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4*. The maximum resolved bus ratio can be read from the following bit field:

- If XE operation is disabled, the maximum resolved bus ratio can be read in MSR\_PLATFORM\_ID[12:8]. It corresponds to the Processor Base frequency.
- If XE operation is enabled, the maximum resolved bus ratio is given in MSR\_PERF\_STATUS[44:40], it corresponds to the maximum XE operation frequency configured by BIOS.

XE operation of an Intel 64 processor is implementation specific. XE operation can be enabled only by BIOS. If MSR\_PERF\_STATUS[31] is set, XE operation is enabled. The MSR\_PERF\_STATUS[31] field is read-only.

## 18.8 IA32\_PERF\_CAPABILITIES MSR ENUMERATION

The layout of IA32\_PERF\_CAPABILITIES MSR is shown in Figure 18-63, it provides enumeration of a variety of interfaces:

- IA32\_PERF\_CAPABILITIES.LBR\_FMT[bits 5:0]: encodes the LBR format, details are described in Section 17.4.8.1.
- IA32\_PERF\_CAPABILITIES.PEBSTrap[6]: Trap/Fault-like indicator of PEBS recording assist, see Section 18.6.2.4.2.
- IA32\_PERF\_CAPABILITIES.PEBSArchRegs[7]: Indicator of PEBS assist save architectural registers, see Section 18.6.2.4.2.
- IA32\_PERF\_CAPABILITIES.PEBS\_FMT[bits 11:8]: Specifies the encoding of the layout of PEBS records, see Section 18.6.2.4.2.
- IA32\_PERF\_CAPABILITIES.FREEZE\_WHILE\_SMM[12]: Indicates IA32\_DEBUGCTL.FREEZE\_WHILE\_SMM is supported if 1, see Section 18.8.1.
- IA32\_PERF\_CAPABILITIES.FULL\_WRITE[13]: Indicates the processor supports IA32\_A\_PMCx interface for updating bits 32 and above of IA32\_PMCx, see Section 18.2.5.

Figure 18-63. Layout of IA32\_PERF\_CAPABILITIES MSR

### 18.8.1 Filtering of SMM Handler Overhead

When performance monitoring facilities and/or branch profiling facilities (see Section 17.5, “Last Branch, Interrupt, and Exception Recording (Intel® Core™ 2 Duo and Intel® Atom™ Processors)”) are enabled, these facilities capture event counts, branch records and branch trace messages occurring in a logical processor. The occurrence of interrupts, instruction streams due to various interrupt handlers all contribute to the results recorded by these facilities.

If CPUID.01H:ECX.PDCM[bit 15] is 1, the processor supports the IA32\_PERF\_CAPABILITIES MSR. If IA32\_PERF\_CAPABILITIES.FREEZE\_WHILE\_SMM[Bit 12] is 1, the processor supports the ability for system software using performance monitoring and/or branch profiling facilities to filter out the effects of servicing system management interrupts.

If the FREEZE\_WHILE\_SMM capability is enabled on a logical processor and after an SMI is delivered, the processor will clear all the enable bits of IA32\_PERF\_GLOBAL\_CTRL, save a copy of the content of IA32\_DEBUGCTL and disable LBR, BTF, TR, and BTS fields of IA32\_DEBUGCTL before transferring control to the SMI handler.

The enable bits of IA32\_PERF\_GLOBAL\_CTRL will be set to 1, the saved copy of IA32\_DEBUGCTL prior to SMI delivery will be restored, after the SMI handler issues RSM to complete its servicing.

It is the responsibility of the SMM code to ensure the state of the performance monitoring and branch profiling facilities are preserved upon entry or until prior to exiting the SMM. If any of this state is modified due to actions by the SMM code, the SMM code is required to restore such state to the values present at entry to the SMM handler.

System software is allowed to set IA32\_DEBUGCTL.FREEZE\_WHILE\_SMM[bit 14] to 1 only supported as indicated by IA32\_PERF\_CAPABILITIES.FREEZE\_WHILE\_SMM[Bit 12] reporting 1.

## 19. Updates to Chapter 19, Volume 3B

Change bars show changes to Chapter 19 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B: System Programming Guide, Part 2*.

-----

Changes to this chapter: Added ROB\_MISC\_EVENTS.LBR\_INSERTS event to Table 19-4 "Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture".

## CHAPTER 19

# PERFORMANCE MONITORING EVENTS

---

This chapter lists the performance monitoring events that can be monitored with the Intel 64 or IA-32 processors. The ability to monitor performance events and the events that can be monitored in these processors are mostly model-specific, except for architectural performance events, described in Section 19.1.

Model-specific performance events are listed for each generation of microarchitecture:

- Section 19.2 - Processors based on Skylake microarchitecture
- Section 19.3 - Processors based on Skylake and Kaby Lake microarchitectures
- Section 19.4 - Processors based on Knights Landing microarchitecture
- Section 19.5 - Processors based on Broadwell microarchitecture
- Section 19.6 - Processors based on Haswell microarchitecture
- Section 19.6.1 - Processors based on Haswell-E microarchitecture
- Section 19.7 - Processors based on Ivy Bridge microarchitecture
- Section 19.7.1 - Processors based on Ivy Bridge-E microarchitecture
- Section 19.8 - Processors based on Sandy Bridge microarchitecture
- Section 19.9 - Processors based on Intel® microarchitecture code name Nehalem
- Section 19.10 - Processors based on Intel® microarchitecture code name Westmere
- Section 19.11 - Processors based on Enhanced Intel® Core™ microarchitecture
- Section 19.12 - Processors based on Intel® Core™ microarchitecture
- Section 19.13 - Processors based on the Goldmont microarchitecture
- Section 19.15 - Processors based on the Silvermont microarchitecture
- Section 19.15.1 - Processors based on the Airmont microarchitecture
- Section 19.16 - 45 nm and 32 nm Intel® Atom™ Processors
- Section 19.17 - Intel® Core™ Solo and Intel® Core™ Duo processors
- Section 19.18 - Processors based on Intel NetBurst® microarchitecture
- Section 19.19 - Pentium® M family processors
- Section 19.20 - P6 family processors
- Section 19.21 - Pentium® processors

### NOTE

These performance monitoring events are intended to be used as guides for performance tuning. The counter values reported by the performance monitoring events are approximate and believed to be useful as relative guides for tuning software. Known discrepancies are documented where applicable.

All performance event encodings not documented in the appropriate tables for the given processor are considered reserved, and their use will result in undefined counter updates with associated overflow actions.

The event tables listed in this chapter provide information for tool developers to support architectural and model-specific performance monitoring events. The tables are up to date at processor launch, but are subject to changes. The most up to date event tables and additional details of performance event implementation for end-user (including additional details beyond event code/umask) can be found at the “perfmon” repository provided by The Intel Open Source Technology Center (<https://download.01.org/perfmon/>).

## 19.1 ARCHITECTURAL PERFORMANCE MONITORING EVENTS

Architectural performance events are introduced in Intel Core Solo and Intel Core Duo processors. They are also supported on processors based on Intel Core microarchitecture. Table 19-1 lists pre-defined architectural performance events that can be configured using general-purpose performance counters and associated event-select registers.

**Table 19-1. Architectural Performance Events**

| Event Num. | Event Mask Name                        | Umask Value | Description   |
|------------|--|-------------|---|
| 3CH        | UnHalted Core Cycles                   | 00H         | Counts core clock cycles whenever the logical processor is in C0 state (not halted). The frequency of this event varies with state transitions in the core. |
| 3CH        | UnHalted Reference Cycles <sup>1</sup> | 01H         | Counts at a fixed frequency whenever the logical processor is in C0 state (not halted).   |
| C0H        | Instructions Retired                   | 00H         | Counts when the last uop of an instruction retires.   |
| 2EH        | LLC Reference                          | 4FH         | Counts requests originating from the core that reference a cache line in the last level on-die cache.   |
| 2EH        | LLC Misses                             | 41H         | Counts each cache miss condition for references to the last level on-die cache.   |
| C4H        | Branch Instruction Retired             | 00H         | Counts when the last uop of a branch instruction retires.   |
| C5H        | Branch Misses Retired                  | 00H         | Counts when the last uop of a branch instruction retires which corrected misprediction of the branch prediction hardware at execution time.                 |

### NOTES:

1. Current implementations count at core crystal clock, TSC, or bus clock frequency.

Fixed-function performance counters count only events defined in Table 19-2.

**Table 19-2. Fixed-Function Performance Counter and Pre-defined Performance Events**

| Fixed-Function Performance Counter | Address | Event Mask Mnemonic   | Description   |
|------------------------------------|---------|---|---|
| IA32_PERF_FIXED_CTR0               | 309H    | Inst_Retired.Any  | This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.   |
| IA32_PERF_FIXED_CTR1               | 30AH    | CPU_CLK_UNHALTED.THREAD/CPU_CLK_UNHALTED.CORE/CPU_CLK_UNHALTED.THREAD_ANY | <p>The CPU_CLK_UNHALTED.THREAD event counts the number of core cycles while the logical processor is not in a halt state.</p> <p>If there is only one logical processor in a processor core, CPU_CLK_UNHALTED.CORE counts the unhalted cycles of the processor core.</p> <p>If there are more than one logical processor in a processor core, CPU_CLK_UNHALTED.THREAD_ANY is supported by programming IA32_FIXED_CTR_CTRL[bit 6]AnyThread = 1.</p> <p>The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time.</p> |

**Table 19-2. Fixed-Function Performance Counter and Pre-defined Performance Events (Contd.)**

| Fixed-Function Performance Counter | Address | Event Mask Mnemonic      | Description   |
|------------------------------------|---------|--------------------------|---|
| IA32_PERF_FIXED_CTR2               | 30BH    | CPU_CLK_UNHALTED.REF_TSC | This event counts the number of reference cycles at the TSC rate when the core is not in a halt state and not in a TM stop-clock state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction. This event is not affected by core frequency changes (e.g., P states) but counts at the same frequency as the time stamp counter. This event can approximate elapsed time while the core was not in a halt state and not in a TM stopclock state. |

## 19.2 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON® PROCESSOR SCALABLE FAMILY

The Intel® Xeon® Processor Scalable Family is based on the Skylake microarchitecture. These processors support the architectural performance monitoring events listed in Table 19-1. Fixed counters in the core PMU support the architecture events defined in Table 19-2. Model-specific performance monitoring events in the processor core are listed in Table 19-4. The events in Table 19-4 apply to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following value: 06\_55H .

The comment column in Table 19-4 uses abbreviated letters to indicate additional conditions applicable to the Event Mask Mnemonic. For event umasks listed in Table 19-4 that do not show "AnyT", users should refrain from programming "AnyThread =1" in IA32\_PERF\_EVTSELx.

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic     | Description  | Comment       |
|------------|-------------|-------------------------|--|---------------|
| 00H        | 01H         | INST_RETIRED.ANY        | Counts the number of instructions retired from execution. For instructions that consist of multiple micro-ops, Counts the retirement of the last micro-op of the instruction. Counting continues during hardware interrupts, traps, and inside interrupt handlers. Notes: INST_RETIRED.ANY is counted by a designated fixed counter, leaving the four (eight when Hyperthreading is disabled) programmable counters available for other events. INST_RETIRED.ANY_P is counted by a programmable counter and it is an architectural performance event. Counting: Faulting executions of GETSEC/VM entry/VM Exit/MWait will not count as retired instructions.                                   | Fixed Counter |
| 00H        | 02H         | CPU_CLK_UNHALTED.THREAD | Counts the number of core cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios. The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time. When the core frequency is constant, this event can approximate elapsed time while the core was not in the halt state. It is counted on a dedicated fixed counter, leaving the four (eight when Hyperthreading is disabled) programmable counters available for other events. | Fixed Counter |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic         | Description  | Comment       |
|------------|-------------|-----------------------------|--|---------------|
| 00H        | 02H         | CPU_CLK_UNHALTED.THREAD_ANY | Core cycles when at least one thread on the physical core is not in halt state.  | AnyThread=1   |
| 00H        | 03H         | CPU_CLK_UNHALTED.REF_TSC    | Counts the number of reference cycles when the core is not in a halt state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction. This event is not affected by core frequency changes (for example, P states, TM2 transitions) but has the same incrementing frequency as the time stamp counter. This event can approximate elapsed time while the core was not in a halt state. This event has a constant ratio with the CPU_CLK_UNHALTED.REF_XCLK event. It is counted on a dedicated fixed counter, leaving the four (eight when Hyperthreading is disabled) programmable counters available for other events. Note: On all current platforms this event stops counting during 'throttling (TM)' states duty off periods the processor is 'halted'. The counter update is done at a lower clock rate than the core clock the overflow status bit for this counter may appear 'sticky'. After the counter has overflowed and software clears the overflow status bit and resets the counter to less than MAX. The reset value to the counter is not clocked immediately so the overflow status bit will flip "high (1)" and generate another PMI (if enabled) after which the reset value gets clocked into the counter. Therefore, software will get the interrupt, read the overflow status bit '1' for bit 34 while the counter value is less than MAX. Software should ignore this case. | Fixed Counter |
| 03H        | 02H         | LD_BLOCKS.STORE_FORWARD     | Counts how many times the load operation got the true Block-on-Store blocking code preventing store forwarding. This includes cases when: a. preceding store conflicts with the load (incomplete overlap), b. store forwarding is impossible due to u-arch limitations, c. preceding lock RMW operations are not forwarded, d. store has the no-forward bit set (uncacheable/page-split/masked stores), e. all-blocking stores are used (mostly, fences and port I/O), and others. The most common case is a load blocked due to its address range overlapping with a preceding smaller uncompleted store. Note: This event does not take into account cases of out-of-SW-control (for example, SbTailHit), unknown physical STA, and cases of blocking loads on store due to being non-WB memory type or a lock. These cases are covered by other events. See the table of not supported store forwards in the Optimization Guide.  |               |
| 03H        | 08H         | LD_BLOCKS.NO_SR             | The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.   |               |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                   | Description   | Comment                              |
|------------|-------------|---------------------------------------|---|--------------------------------------|
| 07H        | 01H         | LD_BLOCKS_PARTIAL.ADDRESS_ALIAS       | Counts false dependencies in MOB when the partial comparison upon loose net check and dependency was resolved by the Enhanced Loose net mechanism. This may not result in high performance penalties. Loose net checks can fail when loads and stores are 4k aliased. |                                      |
| 08H        | 01H         | DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK   | Counts demand data loads that caused a page walk of any page size (4K/2M/4M/1G). This implies it missed in all TLB levels, but the walk need not have completed.  |                                      |
| 08H        | 02H         | DTLB_LOAD_MISSES.WALK_COMPLETED_4K    | Counts demand data loads that caused a completed page walk (4K page size). This implies it missed in all TLB levels. The page walk can end with or without a fault.   |                                      |
| 08H        | 04H         | DTLB_LOAD_MISSES.WALK_COMPLETED_2M_4M | Counts demand data loads that caused a completed page walk (2M and 4M page sizes). This implies it missed in all TLB levels. The page walk can end with or without a fault.   |                                      |
| 08H        | 08H         | DTLB_LOAD_MISSES.WALK_COMPLETED_1G    | Counts load misses in all DTLB levels that cause a completed page walk (1G page size). The page walk can end with or without a fault.   |                                      |
| 08H        | 0EH         | DTLB_LOAD_MISSES.WALK_COMPLETED       | Counts demand data loads that caused a completed page walk of any page size (4K/2M/4M/1G). This implies it missed in all TLB levels. The page walk can end with or without a fault.   |                                      |
| 08H        | 10H         | DTLB_LOAD_MISSES.WALK_PENDING         | Counts 1 per cycle for each PMH that is busy with a page walk for a load. EPT page walk duration are excluded in Skylake microarchitecture.   |                                      |
| 08H        | 10H         | DTLB_LOAD_MISSES.WALK_ACTIVE          | Counts cycles when at least one PMH (Page Miss Handler) is busy with a page walk for a load.  | CounterMask=1<br>CMSK1               |
| 08H        | 20H         | DTLB_LOAD_MISSES.STLB_HIT             | Counts loads that miss the DTLB (Data TLB) and hit the STLB (Second level TLB).   |                                      |
| 0DH        | 01H         | INT_MISC.RECOVERY_CYCLES              | Core cycles the Resource allocator was stalled due to recovery from an earlier branch misprediction or machine clear event.   |                                      |
| 0DH        | 01H         | INT_MISC.RECOVERY_CYCLES_ANY          | Core cycles the allocator was stalled due to recovery from earlier clear event for any thread running on the physical core (e.g. misprediction or memory nuke).   | AnyThread=1 AnyT                     |
| 0DH        | 80H         | INT_MISC.CLEAR_RESTEER_CYCLES         | Cycles the issue-stage is waiting for front-end to fetch from resteeered path following branch misprediction or machine clear events.   |                                      |
| 0EH        | 01H         | UOPS_ISSUED.ANY                       | Counts the number of uops that the Resource Allocation Table (RAT) issues to the Reservation Station (RS).  |                                      |
| 0EH        | 01H         | UOPS_ISSUED.STALL_CYCLES              | Counts cycles during which the Resource Allocation Table (RAT) does not issue any uops to the reservation station (RS) for the current thread.  | CounterMask=1<br>Invert=1 CMSK1, INV |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic               | Description   | Comment       |
|------------|-------------|-----------------------------------|---|---------------|
| 0EH        | 02H         | UOPS_ISSUED.VECTOR_WIDTH_MISMATCH | Counts the number of Blend Uops issued by the Resource Allocation Table (RAT) to the reservation station (RS) in order to preserve upper bits of vector registers. Starting with the Skylake microarchitecture, these Blend uops are needed since every Intel SSE instruction executed in Dirty Upper State needs to preserve bits 128-255 of the destination register. For more information, refer to Mixing Intel AVX and Intel SSE Code section of the Optimization Guide. |               |
| 0EH        | 20H         | UOPS_ISSUED.SLOW_LEA              | Number of slow LEA uops being allocated. A uop is generally considered SlowLea if it has 3 sources (e.g. 2 sources + immediate) regardless if as a result of LEA instruction or not.  |               |
| 14H        | 01H         | ARITH.DIVIDER_ACTIVE              | Cycles when divide unit is busy executing divide or square root operations. Accounts for integer and floating-point operations.   | CounterMask=1 |
| 24H        | 21H         | L2_RQSTS.DEMAND_DATA_RD_MISS      | Counts the number of demand Data Read requests that miss L2 cache. Only not rejected loads are counted.   |               |
| 24H        | 22H         | L2_RQSTS.RFO_MISS                 | Counts the RFO (Read-for-Ownership) requests that miss L2 cache.  |               |
| 24H        | 24H         | L2_RQSTS.CODE_RD_MISS             | Counts L2 cache misses when fetching instructions.  |               |
| 24H        | 27H         | L2_RQSTS.ALL_DEMAND_MISS          | Demand requests that miss L2 cache.   |               |
| 24H        | 38H         | L2_RQSTS.PF_MISS                  | Counts requests from the L1/L2/L3 hardware prefetchers or Load software prefetches that miss L2 cache.  |               |
| 24H        | 3FH         | L2_RQSTS.MISS                     | All requests that miss L2 cache.  |               |
| 24H        | 41H         | L2_RQSTS.DEMAND_DATA_RD_HIT       | Counts the number of demand Data Read requests that hit L2 cache. Only non rejected loads are counted.  |               |
| 24H        | 42H         | L2_RQSTS.RFO_HIT                  | Counts the RFO (Read-for-Ownership) requests that hit L2 cache.   |               |
| 24H        | 44H         | L2_RQSTS.CODE_RD_HIT              | Counts L2 cache hits when fetching instructions, code reads.  |               |
| 24H        | D8H         | L2_RQSTS.PF_HIT                   | Counts requests from the L1/L2/L3 hardware prefetchers or Load software prefetches that hit L2 cache.   |               |
| 24H        | E1H         | L2_RQSTS.ALL_DEMAND_DATA_RD       | Counts the number of demand Data Read requests (including requests from L1D hardware prefetchers). These loads may hit or miss L2 cache. Only non rejected loads are counted.   |               |
| 24H        | E2H         | L2_RQSTS.ALL_RFO                  | Counts the total number of RFO (read for ownership) requests to L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.   |               |
| 24H        | E4H         | L2_RQSTS.ALL_CODE_RD              | Counts the total number of L2 code requests.  |               |
| 24H        | E7H         | L2_RQSTS.ALL_DEMAND_REFERENCES    | Demand requests to L2 cache.  |               |
| 24H        | F8H         | L2_RQSTS.ALL_PF                   | Counts the total number of requests from the L2 hardware prefetchers.   |               |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                           | Description   | Comment                       |
|------------|-------------|---|---|-------------------------------|
| 24H        | FFH         | L2_RQSTS.REFERENCES                           | All L2 requests.  |                               |
| 28H        | 07H         | CORE_POWER.LVL0_TURBO_LIC<br>ENSE             | Core cycles where the core was running with power-delivery for baseline license level 0. This includes non-AVX codes, SSE, AVX 128-bit, and low-current AVX 256-bit codes.  |                               |
| 28H        | 18H         | CORE_POWER.LVL1_TURBO_LIC<br>ENSE             | Core cycles where the core was running with power-delivery for license level 1. This includes high current AVX 256-bit instructions as well as low current AVX 512-bit instructions.  |                               |
| 28H        | 20H         | CORE_POWER.LVL2_TURBO_LIC<br>ENSE             | Core cycles where the core was running with power-delivery for license level 2 (introduced in Skylake Server microarchitecture). This includes high current AVX 512-bit instructions.   |                               |
| 28H        | 40H         | CORE_POWER.THROTTLE                           | Core cycles the out-of-order engine was throttled due to a pending power level request.   |                               |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS                        | Counts core-originated cacheable requests that miss the L3 cache (Longest Latency cache). Requests include data and code reads, Reads-for-Ownership (RFOs), speculative accesses and hardware prefetches from L1 and L2. It does not include all misses to the L3.  | See Table 19-1.               |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFEREN<br>CE               | Counts core-originated cacheable requests to the L3 cache (Longest Latency cache). Requests include data and code reads, Reads-for-Ownership (RFOs), speculative accesses and hardware prefetches from L1 and L2. It does not include all accesses to the L3.   | See Table 19-1.               |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_<br>P                 | This is an architectural event that counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling. For this reason, this event may have a changing ratio with regards to wall clock time. | See Table 19-1.               |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_<br>P_ANY             | Core cycles when at least one thread on the physical core is not in halt state.   | AnyThread=1 AnyT              |
| 3CH        | 00H         | CPU_CLK_UNHALTED.RINGO_TR<br>ANS              | Counts when the Current Privilege Level (CPL) transitions from ring 1, 2 or 3 to ring 0 (Kernel).   | EdgeDetect=1<br>CounterMask=1 |
| 3CH        | 01H         | CPU_CLK_THREAD_UNHALTED.<br>REF_XCLK          | Core crystal clock cycles when the thread is unhalting.   | See Table 19-1.               |
| 3CH        | 01H         | CPU_CLK_THREAD_UNHALTED.<br>REF_XCLK_ANY      | Core crystal clock cycles when at least one thread on the physical core is unhalting.   | AnyThread=1 AnyT              |
| 3CH        | 01H         | CPU_CLK_UNHALTED.REF_XCLK                     | Core crystal clock cycles when the thread is unhalting.   | See Table 19-1.               |
| 3CH        | 01H         | CPU_CLK_UNHALTED.REF_XCLK<br>_ANY             | Core crystal clock cycles when at least one thread on the physical core is unhalting.   | AnyThread=1 AnyT              |
| 3CH        | 02H         | CPU_CLK_THREAD_UNHALTED.<br>ONE_THREAD_ACTIVE | Core crystal clock cycles when this thread is unhalting and the other thread is halted.   |                               |
| 3CH        | 02H         | CPU_CLK_UNHALTED.ONE_THR<br>EAD_ACTIVE        | Core crystal clock cycles when this thread is unhalting and the other thread is halted.   |                               |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description  | Comment                                     |
|------------|-------------|--|--|---|
| 48H        | 01H         | L1D_PEND_MISS.PENDING                  | Counts duration of L1D miss outstanding, that is each cycle number of Fill Buffers (FB) outstanding required by Demand Reads. FB either is held by demand loads, or it is held by non-demand loads and gets hit at least once by demand. The valid outstanding interval is defined until the FB deallocation by one of the following ways: from FB allocation, if FB is allocated by demand from the demand Hit FB, if it is allocated by hardware or software prefetch. Note: In the L1D, a Demand Read contains cacheable or noncacheable demand loads, including ones causing cache-line splits and reads due to page walks resulted from any request type. |   |
| 48H        | 01H         | L1D_PEND_MISS.PENDING_CYCLES           | Counts duration of L1D miss outstanding in cycles.   | CounterMask=1<br>CMSK1                      |
| 48H        | 01H         | L1D_PEND_MISS.PENDING_CYCLES_ANY       | Cycles with L1D load Misses outstanding from any thread on physical core.  | CounterMask=1<br>AnyThread=1<br>CMSK1, AnyT |
| 48H        | 02H         | L1D_PEND_MISS.FB_FULL                  | Number of times a request needed a FB (Fill Buffer) entry but there was no entry available for it. A request includes cacheable/uncacheable demands that are load, store or SW prefetch instructions.  |   |
| 49H        | 01H         | DTLB_STORE_MISSES.MISS_CAUSES_A_WALK   | Counts demand data stores that caused a page walk of any page size (4K/2M/4M/1G). This implies it missed in all TLB levels, but the walk need not have completed.  |   |
| 49H        | 02H         | DTLB_STORE_MISSES.WALK_COMPLETED_4K    | Counts demand data stores that caused a completed page walk (4K page size). This implies it missed in all TLB levels. The page walk can end with or without a fault.   |   |
| 49H        | 04H         | DTLB_STORE_MISSES.WALK_COMPLETED_2M_4M | Counts demand data stores that caused a completed page walk (2M and 4M page sizes). This implies it missed in all TLB levels. The page walk can end with or without a fault.   |   |
| 49H        | 08H         | DTLB_STORE_MISSES.WALK_COMPLETED_1G    | Counts store misses in all DTLB levels that cause a completed page walk (1G page size). The page walk can end with or without a fault.   |   |
| 49H        | 0EH         | DTLB_STORE_MISSES.WALK_COMPLETED       | Counts demand data stores that caused a completed page walk of any page size (4K/2M/4M/1G). This implies it missed in all TLB levels. The page walk can end with or without a fault.   |   |
| 49H        | 10H         | DTLB_STORE_MISSES.WALK_PENDING         | Counts 1 per cycle for each PMH that is busy with a page walk for a store. EPT page walk duration are excluded in Skylake microarchitecture.   |   |
| 49H        | 10H         | DTLB_STORE_MISSES.WALK_ACTIVE          | Counts cycles when at least one PMH (Page Miss Handler) is busy with a page walk for a store.  | CounterMask=1<br>CMSK1                      |
| 49H        | 20H         | DTLB_STORE_MISSES.STLB_HIT             | Stores that miss the DTLB (Data TLB) and hit the STLB (2nd Level TLB).   |   |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic   | Description  | Comment  |
|------------|-------------|---|--|--|
| 4CH        | 01H         | LOAD_HIT_PRE.SW_PF  | Counts all not software-prefetch load dispatches that hit the fill buffer (FB) allocated for the software prefetch. It can also be incremented by some lock instructions. So it should only be used with profiling so that the locks can be excluded by ASM (Assembly File) inspection of the nearby instructions. |  |
| 4FH        | 10H         | EPT.WALK_PENDING  | Counts cycles for each PMH (Page Miss Handler) that is busy with an EPT (Extended Page Table) walk for any request type.   |  |
| 51H        | 01H         | L1D.REPLACEMENT   | Counts L1D data line replacements including opportunistic replacements, and replacements that require stall-for-replace or block-for-replace.  |  |
| 54H        | 01H         | TX_MEM.ABORT_CONFLICT   | Number of times a TSX line had a cache conflict.   |  |
| 54H        | 02H         | TX_MEM.ABORT_CAPACITY   | Number of times a transactional abort was signaled due to a data capacity limitation for transactional reads or writes.  |  |
| 54H        | 04H         | TX_MEM.ABORT_HLE_STORE_T<br>O_ELIDED_LOCK                     | Number of times a TSX Abort was triggered due to a non-release/commit store to lock.   |  |
| 54H        | 08H         | TX_MEM.ABORT_HLE_ELISION_<br>BUFFER_NOT_EMPTY                 | Number of times a TSX Abort was triggered due to commit but Lock Buffer not empty.   |  |
| 54H        | 10H         | TX_MEM.ABORT_HLE_ELISION_<br>BUFFER_MISMATCH                  | Number of times a TSX Abort was triggered due to release/commit but data and address mismatch.   |  |
| 54H        | 20H         | TX_MEM.ABORT_HLE_ELISION_<br>BUFFER_UNSUPPORTED_ALIGN<br>MENT | Number of times a TSX Abort was triggered due to attempting an unsupported alignment from Lock Buffer.   |  |
| 54H        | 40H         | TX_MEM.HLE_ELISION_BUFFER_<br>FULL                            | Number of times we could not allocate Lock Buffer.   |  |
| 5DH        | 01H         | TX_EXEC.MISC1   | Unfriendly TSX abort triggered by a flowmarker.  |  |
| 5DH        | 02H         | TX_EXEC.MISC2   | Unfriendly TSX abort triggered by a vzeroupper instruction.  |  |
| 5DH        | 04H         | TX_EXEC.MISC3   | Unfriendly TSX abort triggered by a nest count that is too deep.   |  |
| 5DH        | 08H         | TX_EXEC.MISC4   | RTM region detected inside HLE.  |  |
| 5DH        | 10H         | TX_EXEC.MISC5   | Counts the number of times an HLE XACQUIRE instruction was executed inside an RTM transactional region.  |  |
| 5EH        | 01H         | RS_EVENTS.EMPTY_CYCLES  | Counts cycles during which the reservation station (RS) is empty for the thread; Note: In ST-mode, not active thread should drive 0. This is usually caused by severely costly branch mispredictions, or allocator/FE issues.  |  |
| 5EH        | 01H         | RS_EVENTS.EMPTY_END   | Counts end of periods where the Reservation Station (RS) was empty. Could be useful to precisely locate front-end Latency Bound issues.  | EdgeDetect=1<br>CounterMask=1<br>Invert=1 CMSK1, INV |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                                     | Description   | Comment                |
|------------|-------------|---|---|------------------------|
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD             | Counts the number of offcore outstanding Demand Data Read transactions in the super queue (SQ) every cycle. A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor. See the corresponding Umask under OFFCORE_REQUESTS. Note: A prefetch promoted to Demand is counted from the promotion point. |                        |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_DATA_RD | Counts cycles when offcore outstanding Demand Data Read transactions are present in the super queue (SQ). A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor (SQ de-allocation).   | CounterMask=1<br>CMSK1 |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD_GE_6        | Cycles with at least 6 offcore outstanding Demand Data Read transactions in uncore queue.   | CounterMask=6<br>CMSK6 |
| 60H        | 02H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_CODE_RD             | Counts the number of offcore outstanding Code Reads transactions in the super queue every cycle. The 'Offcore outstanding' state of the transaction lasts from the L2 miss until the sending transaction completion to requestor (SQ deallocation). See the corresponding Umask under OFFCORE_REQUESTS.   | CounterMask=1<br>CMSK1 |
| 60H        | 02H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_CODE_RD | Counts the number of offcore outstanding Code Reads transactions in the super queue every cycle. The 'Offcore outstanding' state of the transaction lasts from the L2 miss until the sending transaction completion to requestor (SQ deallocation). See the corresponding Umask under OFFCORE_REQUESTS.   | CMSK1                  |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO                 | Counts the number of offcore outstanding RFO (store) transactions in the super queue (SQ) every cycle. A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor (SQ de-allocation). See corresponding Umask under OFFCORE_REQUESTS.  | CounterMask=1<br>CMSK1 |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_RFO     | Counts the number of offcore outstanding demand rfo Reads transactions in the super queue every cycle. The 'Offcore outstanding' state of the transaction lasts from the L2 miss until the sending transaction completion to requestor (SQ deallocation). See the corresponding Umask under OFFCORE_REQUESTS.   | CMSK1                  |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD                | Counts the number of offcore outstanding cacheable Core Data Read transactions in the super queue every cycle. A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor (SQ de-allocation). See corresponding Umask under OFFCORE_REQUESTS.  |                        |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DATA_RD        | Counts cycles when offcore outstanding cacheable Core Data Read transactions are present in the super queue. A transaction is considered to be in the Offcore outstanding state between L2 miss and transaction completion sent to requestor (SQ de-allocation). See corresponding Umask under OFFCORE_REQUESTS.  | CounterMask=1<br>CMSK1 |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic   | Description  | Comment                |
|------------|-------------|---|--|------------------------|
| 60H        | 10H         | OFFCORE_REQUESTS_OUTSTANDING.L3_MISS_DEMAND_DATA_RD             | Counts number of Offcore outstanding Demand Data Read requests that miss L3 cache in the superQ every cycle.   |                        |
| 60H        | 10H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_L3_MISS_DEMAND_DATA_RD | Cycles with at least 1 Demand Data Read requests who miss L3 cache in the superQ.  | CounterMask=1<br>CMSK1 |
| 60H        | 10H         | OFFCORE_REQUESTS_OUTSTANDING.L3_MISS_DEMAND_DATA_RD_GE_6        | Cycles with at least 6 Demand Data Read requests that miss L3 cache in the superQ.   | CounterMask=6<br>CMSK6 |
| 79H        | 04H         | IDQ.MITE_UOPS   | Counts the number of uops delivered to Instruction Decode Queue (IDQ) from the MITE path. Counting includes uops that may 'bypass' the IDQ. This also means that uops are not being delivered from the Decode Stream Buffer (DSB).   |                        |
| 79H        | 04H         | IDQ.MITE_CYCLES   | Counts cycles during which uops are being delivered to Instruction Decode Queue (IDQ) from the MITE path. Counting includes uops that may 'bypass' the IDQ.  | CounterMask=1<br>CMSK1 |
| 79H        | 08H         | IDQ.DSB_UOPS  | Counts the number of uops delivered to Instruction Decode Queue (IDQ) from the Decode Stream Buffer (DSB) path. Counting includes uops that may 'bypass' the IDQ.  |                        |
| 79H        | 08H         | IDQ.DSB_CYCLES  | Counts cycles during which uops are being delivered to Instruction Decode Queue (IDQ) from the Decode Stream Buffer (DSB) path. Counting includes uops that may 'bypass' the IDQ.  | CounterMask=1<br>CMSK1 |
| 79H        | 10H         | IDQ.MS_DSB_CYCLES   | Counts cycles during which uops initiated by Decode Stream Buffer (DSB) are being delivered to Instruction Decode Queue (IDQ) while the Microcode Sequencer (MS) is busy. Counting includes uops that may 'bypass' the IDQ.  | CounterMask=1          |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_4_UOPS                                       | Counts the number of cycles 4 uops were delivered to Instruction Decode Queue (IDQ) from the Decode Stream Buffer (DSB) path. Count includes uops that may 'bypass' the IDQ.   | CounterMask=4<br>CMSK4 |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_ANY_UOPS                                     | Counts the number of cycles uops were delivered to Instruction Decode Queue (IDQ) from the Decode Stream Buffer (DSB) path. Count includes uops that may 'bypass' the IDQ.   | CounterMask=1<br>CMSK1 |
| 79H        | 20H         | IDQ.MS_MITE_UOPS  | Counts the number of uops initiated by MITE and delivered to Instruction Decode Queue (IDQ) while the Microcode Sequencer (MS) is busy. Counting includes uops that may 'bypass' the IDQ.  |                        |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_4_UOPS                                      | Counts the number of cycles 4 uops were delivered to the Instruction Decode Queue (IDQ) from the MITE (legacy decode pipeline) path. Counting includes uops that may 'bypass' the IDQ. During these cycles uops are not being delivered from the Decode Stream Buffer (DSB). | CounterMask=4<br>CMSK4 |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic               | Description  | Comment                               |
|------------|-------------|-----------------------------------|--|---------------------------------------|
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_ANY_UOPS      | Counts the number of cycles uops were delivered to the Instruction Decode Queue (IDQ) from the MITE (legacy decode pipeline) path. Counting includes uops that may 'bypass' the IDQ. During these cycles uops are not being delivered from the Decode Stream Buffer (DSB). | CounterMask=1<br>CMSK1                |
| 79H        | 30H         | IDQ.MS_CYCLES                     | Counts cycles during which uops are being delivered to Instruction Decode Queue (IDQ) while the Microcode Sequencer (MS) is busy. Counting includes uops that may 'bypass' the IDQ. Uops maybe initiated by Decode Stream Buffer (DSB) or MITE.                            | CounterMask=1<br>CMSK1                |
| 79H        | 30H         | IDQ.MS_SWITCHES                   | Number of switches from DSB (Decode Stream Buffer) or MITE (legacy decode pipeline) to the Microcode Sequencer.  | EdgeDetect=1<br>CounterMask=1<br>EDGE |
| 79H        | 30H         | IDQ.MS_UOPS                       | Counts the total number of uops delivered by the Microcode Sequencer (MS). Any instruction over 4 uops will be delivered by the MS. Some instructions such as transcendentals may additionally generate uops from the MS.  |                                       |
| 80H        | 04H         | ICACHE_16B.IFDATA_STALL           | Cycles where a code line fetch is stalled due to an L1 instruction cache miss. The legacy decode pipeline works at a 16 Byte granularity.  |                                       |
| 83H        | 01H         | ICACHE_64B.IFTAG_HIT              | Instruction fetch tag lookups that hit in the instruction cache (L1I). Counts at 64-byte cache-line granularity.   |                                       |
| 83H        | 02H         | ICACHE_64B.IFTAG_MISS             | Instruction fetch tag lookups that miss in the instruction cache (L1I). Counts at 64-byte cache-line granularity.  |                                       |
| 83H        | 04H         | ICACHE_64B.IFTAG_STALL            | Cycles where a code fetch is stalled due to L1 instruction cache tag miss.   |                                       |
| 85H        | 01H         | ITLB_MISSES.MISS_CAUSES_A_WALK    | Counts page walks of any page size (4K/2M/4M/1G) caused by a code fetch. This implies it missed in the ITLB and further levels of TLB, but the walk need not have completed.   |                                       |
| 85H        | 02H         | ITLB_MISSES.WALK_COMPLETE_D_4K    | Counts completed page walks (4K page size) caused by a code fetch. This implies it missed in the ITLB and further levels of TLB. The page walk can end with or without a fault.  |                                       |
| 85H        | 04H         | ITLB_MISSES.WALK_COMPLETE_D_2M_4M | Counts completed page walks of any page size (4K/2M/4M/1G) caused by a code fetch. This implies it missed in the ITLB and further levels of TLB. The page walk can end with or without a fault.  |                                       |
| 85H        | 08H         | ITLB_MISSES.WALK_COMPLETE_D_1G    | Counts store misses in all DTLB levels that cause a completed page walk (1G page size). The page walk can end with or without a fault.   |                                       |
| 85H        | 0EH         | ITLB_MISSES.WALK_COMPLETE_D       | Counts completed page walks (2M and 4M page sizes) caused by a code fetch. This implies it missed in the ITLB and further levels of TLB. The page walk can end with or without a fault.  |                                       |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                               | Description   | Comment                             |
|------------|-------------|---|---|-------------------------------------|
| 85H        | 10H         | ITLB_MISSES.WALK_PENDING                          | Counts 1 per cycle for each PMH that is busy with a page walk for an instruction fetch request. EPT page walk duration are excluded in Skylake microarchitecture.   |                                     |
| 85H        | 10H         | ITLB_MISSES.WALK_ACTIVE                           | Cycles when at least one PMH is busy with a page walk for code (instruction fetch) request. EPT page walk duration are excluded in Skylake microarchitecture.   | CounterMask=1                       |
| 85H        | 20H         | ITLB_MISSES.STLB_HIT                              | Instruction fetch requests that miss the ITLB and hit the STLB.   |                                     |
| 87H        | 01H         | ILD_STALL.LCP                                     | Counts cycles that the Instruction Length decoder (ILD) stalls occurred due to dynamically changing prefix length of the decoded instruction (by operand size prefix instruction 0x66, address size prefix instruction 0x67 or REX.W for Intel64). Count is proportional to the number of prefixes in a 16B-line. This may result in a three-cycle penalty for each LCP (Length changing prefix) in a 16-byte chunk.  |                                     |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CORE                       | Counts the number of uops not delivered to Resource Allocation Table (RAT) per thread adding “4 - x” when Resource Allocation Table (RAT) is not stalled and Instruction Decode Queue (IDQ) delivers x uops to Resource Allocation Table (RAT) (where x belongs to {0,1,2,3}). Counting does not cover cases when: a. IDQ-Resource Allocation Table (RAT) pipe serves the other thread. b. Resource Allocation Table (RAT) is stalled for the thread (including uop drops and clear BE conditions). c. Instruction Decode Queue (IDQ) delivers four uops. |                                     |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CYCLES_0_UOPS_DELIV.CORE   | Counts, on the per-thread basis, cycles when no uops are delivered to Resource Allocation Table (RAT). IDQ_Uops_Not_Delivered.core =4.  | CounterMask=4<br>CMSK4              |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CYCLES_LE_1_UOP_DELIV.CORE | Counts, on the per-thread basis, cycles when less than 1 uop is delivered to Resource Allocation Table (RAT). IDQ_Uops_Not_Delivered.core >= 3.   | CounterMask=3<br>CMSK3              |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CYCLES_LE_2_UOP_DELIV.CORE | Cycles with less than 2 uops delivered by the front end.  | CounterMask=2<br>CMSK2              |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CYCLES_LE_3_UOP_DELIV.CORE | Cycles with less than 3 uops delivered by the front end.  | CounterMask=1<br>CMSK1              |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CYCLES_FE_WAS_OK           | Counts cycles FE delivered 4 uops or Resource Allocation Table (RAT) was stalling FE.   | CounterMask=1<br>Invert=1 CMSK, INV |
| A1H        | 01H         | UOPS_DISPATCHED_PORT.PORT_0                       | Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 0.  |                                     |
| A1H        | 02H         | UOPS_DISPATCHED_PORT.PORT_1                       | Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 1.  |                                     |
| A1H        | 04H         | UOPS_DISPATCHED_PORT.PORT_2                       | Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 2.  |                                     |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description   | Comment                  |
|------------|-------------|--------------------------------|---|--------------------------|
| A1H        | 08H         | UOPS_DISPATCHED_PORT.PORT_3    | Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 3.  |                          |
| A1H        | 10H         | UOPS_DISPATCHED_PORT.PORT_4    | Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 4.  |                          |
| A1H        | 20H         | UOPS_DISPATCHED_PORT.PORT_5    | Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 5.  |                          |
| A1H        | 40H         | UOPS_DISPATCHED_PORT.PORT_6    | Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 6.  |                          |
| A1H        | 80H         | UOPS_DISPATCHED_PORT.PORT_7    | Counts, on the per-thread basis, cycles during which at least one uop is dispatched from the Reservation Station (RS) to port 7.  |                          |
| A2H        | 01H         | RESOURCE_STALLS.ANY            | Counts resource-related stall cycles. Reasons for stalls can be as follows: a. *any* u-arch structure got full (LB, SB, RS, ROB, BOB, LM, Physical Register Reclaim Table (PRRT), or Physical History Table (PHT) slots). b. *any* u-arch structure got empty (like INT/SIMD FreeLists). c. FPU control word (FPCW), MXCSR and others. This counts cycles that the pipeline back end blocked uop delivery from the front end. |                          |
| A2H        | 08H         | RESOURCE_STALLS.SB             | Counts allocation stall cycles caused by the store buffer (SB) being full. This counts cycles that the pipeline back end blocked uop delivery from the front end.   |                          |
| A3H        | 01H         | CYCLE_ACTIVITY.CYCLES_L2_MISS  | Cycles while L2 cache miss demand load is outstanding.  | CounterMask=1<br>CMSK1   |
| A3H        | 02H         | CYCLE_ACTIVITY.CYCLES_L3_MISS  | Cycles while L3 cache miss demand load is outstanding.  | CounterMask=2<br>CMSK2   |
| A3H        | 04H         | CYCLE_ACTIVITY.STALLS_TOTAL    | Total execution stalls.   | CounterMask=4<br>CMSK4   |
| A3H        | 05H         | CYCLE_ACTIVITY.STALLS_L2_MISS  | Execution stalls while L2 cache miss demand load is outstanding.  | CounterMask=5<br>CMSK5   |
| A3H        | 06H         | CYCLE_ACTIVITY.STALLS_L3_MISS  | Execution stalls while L3 cache miss demand load is outstanding.  | CounterMask=6<br>CMSK6   |
| A3H        | 08H         | CYCLE_ACTIVITY.CYCLES_L1D_MISS | Cycles while L1 cache miss demand load is outstanding.  | CounterMask=8<br>CMSK8   |
| A3H        | 0CH         | CYCLE_ACTIVITY.STALLS_L1D_MISS | Execution stalls while L1 cache miss demand load is outstanding.  | CounterMask=12<br>CMSK12 |
| A3H        | 10H         | CYCLE_ACTIVITY.CYCLES_MEM_ANY  | Cycles while memory subsystem has an outstanding load.  | CounterMask=16<br>CMSK16 |
| A3H        | 14H         | CYCLE_ACTIVITY.STALLS_MEM_ANY  | Execution stalls while memory subsystem has an outstanding load.  | CounterMask=20<br>CMSK20 |
| A6H        | 01H         | EXE_ACTIVITY.EXE_BOUND_0_PORTS | Counts cycles during which no uops were executed on all ports and Reservation Station (RS) was not empty.   |                          |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic              | Description  | Comment                |
|------------|-------------|----------------------------------|--|------------------------|
| A6H        | 02H         | EXE_ACTIVITY.1_PORTS_UTIL        | Counts cycles during which a total of 1 uop was executed on all ports and Reservation Station (RS) was not empty.  |                        |
| A6H        | 04H         | EXE_ACTIVITY.2_PORTS_UTIL        | Counts cycles during which a total of 2 uops were executed on all ports and Reservation Station (RS) was not empty.  |                        |
| A6H        | 08H         | EXE_ACTIVITY.3_PORTS_UTIL        | Cycles total of 3 uops are executed on all ports and Reservation Station (RS) was not empty.   |                        |
| A6H        | 10H         | EXE_ACTIVITY.4_PORTS_UTIL        | Cycles total of 4 uops are executed on all ports and Reservation Station (RS) was not empty.   |                        |
| A6H        | 40H         | EXE_ACTIVITY.BOUND_ON_STORES     | Cycles where the Store Buffer was full and no outstanding load.  |                        |
| A8H        | 01H         | LSD.UOPS                         | Number of uops delivered to the back-end by the LSD (Loop Stream Detector).  |                        |
| A8H        | 01H         | LSD.CYCLES_ACTIVE                | Counts the cycles when at least one uop is delivered by the LSD (Loop-stream detector).  | CounterMask=1<br>CMSK1 |
| A8H        | 01H         | LSD.CYCLES_4_UOPS                | Counts the cycles when 4 uops are delivered by the LSD (Loop-stream detector).   | CounterMask=4<br>CMSK4 |
| ABH        | 02H         | DSB2MITE_SWITCHES.PENALTY_CYCLES | Counts Decode Stream Buffer (DSB)-to-MITE switch true penalty cycles. These cycles do not include uops routed through because of the switch itself, for example, when Instruction Decode Queue (IDQ) pre-allocation is unavailable, or Instruction Decode Queue (IDQ) is full. SBD-to-MITE switch true penalty cycles happen after the merge mux (MM) receives Decode Stream Buffer (DSB) Sync-indication until receiving the first MITE uop. MM is placed before Instruction Decode Queue (IDQ) to merge uops being fed from the MITE and Decode Stream Buffer (DSB) paths. Decode Stream Buffer (DSB) inserts the Sync-indication whenever a Decode Stream Buffer (DSB)-to-MITE switch occurs. Penalty: A Decode Stream Buffer (DSB) hit followed by a Decode Stream Buffer (DSB) miss can cost up to six cycles in which no uops are delivered to the IDQ. Most often, such switches from the Decode Stream Buffer (DSB) to the legacy pipeline cost 0 to 2 cycles. |                        |
| AEH        | 01H         | ITLB.ITLB_FLUSH                  | Counts the number of flushes of the big or small ITLB pages. Counting include both TLB Flush (covering all sets) and TLB Set Clear (set-specific).   |                        |
| BOH        | 01H         | OFFCORE_REQUESTS.DEMAND_DATA_RD  | Counts the Demand Data Read requests sent to uncore. Use it in conjunction with OFFCORE_REQUESTS.OUTSTANDING to determine average latency in the uncore.   |                        |
| BOH        | 02H         | OFFCORE_REQUESTS.DEMAND_CODE_RD  | Counts both cacheable and non-cacheable code read requests.  |                        |
| BOH        | 04H         | OFFCORE_REQUESTS.DEMAND_RFO      | Counts the demand RFO (read for ownership) requests including regular RFOs, locks, ItoM.   |                        |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                     | Description  | Comment                              |
|------------|-------------|---|--|--------------------------------------|
| B0H        | 08H         | OFFCORE_REQUESTS.ALL_DATA_RD            | Counts the demand and prefetch data reads. All Core Data Reads include cacheable 'Demands' and L2 prefetchers (not L3 prefetchers). Counting also covers reads due to page walks resulted from any request type.   |                                      |
| B0H        | 10H         | OFFCORE_REQUESTS.L3_MISS_DEMAND_DATA_RD | Demand Data Read requests who miss L3 cache.   |                                      |
| B0H        | 80H         | OFFCORE_REQUESTS.ALL_REQUESTS           | Counts memory transactions reached the super queue including requests initiated by the core, all L3 prefetches, page walks, etc.   |                                      |
| B1H        | 01H         | UOPS_EXECUTED.THREAD                    | Number of uops to be executed per-thread each cycle.   |                                      |
| B1H        | 01H         | UOPS_EXECUTED.STALL_CYCLES              | Counts cycles during which no uops were dispatched from the Reservation Station (RS) per thread.   | CounterMask=1<br>Invert=1 CMSK, INV  |
| B1H        | 01H         | UOPS_EXECUTED.CYCLES_GE_1_UOP_EXEC      | Cycles where at least 1 uop was executed per-thread.   | CounterMask=1<br>CMSK1               |
| B1H        | 01H         | UOPS_EXECUTED.CYCLES_GE_2_UOPS_EXEC     | Cycles where at least 2 uops were executed per-thread.   | CounterMask=2<br>CMSK2               |
| B1H        | 01H         | UOPS_EXECUTED.CYCLES_GE_3_UOPS_EXEC     | Cycles where at least 3 uops were executed per-thread.   | CounterMask=3<br>CMSK3               |
| B1H        | 01H         | UOPS_EXECUTED.CYCLES_GE_4_UOPS_EXEC     | Cycles where at least 4 uops were executed per-thread.   | CounterMask=4<br>CMSK4               |
| B1H        | 02H         | UOPS_EXECUTED.CORE                      | Number of uops executed from any thread.   |                                      |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_GE_1          | Cycles at least 1 micro-op is executed from any thread on physical core.   | CounterMask=1<br>CMSK1               |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_GE_2          | Cycles at least 2 micro-op is executed from any thread on physical core.   | CounterMask=2<br>CMSK2               |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_GE_3          | Cycles at least 3 micro-op is executed from any thread on physical core.   | CounterMask=3<br>CMSK3               |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_GE_4          | Cycles at least 4 micro-op is executed from any thread on physical core.   | CounterMask=4<br>CMSK4               |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_NONE          | Cycles with no micro-ops executed from any thread on physical core.  | CounterMask=1<br>Invert=1 CMSK1, INV |
| B1H        | 10H         | UOPS_EXECUTED.X87                       | Counts the number of x87 uops executed.  |                                      |
| B2H        | 01H         | OFFCORE_REQUESTS_BUFFER.SQ_FULL         | Counts the number of cases when the offcore requests buffer cannot take more entries for the core. This can happen when the superqueue does not contain eligible entries, or when L1D writeback pending FIFO requests is full. Note: Writeback pending FIFO has six entries. |                                      |
| BDH        | 01H         | TLB_FLUSH.DTLB_THREAD                   | Counts the number of DTLB flush attempts of the thread-specific entries.   |                                      |
| BDH        | 20H         | TLB_FLUSH.STLB_ANY                      | Counts the number of any STLB flush attempts (such as entire, VPID, PCID, InvPage, CR3 write, etc.).   |                                      |
| COH        | 00H         | INST_RETIRED.ANY_P                      | Counts the number of instructions (EOMs) retired. Counting covers macro-fused instructions individually (that is, increments by two).  | See Table 19-1.                      |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description   | Comment   |
|------------|-------------|--------------------------------|---|---|
| C0H        | 01H         | INST_RETIRED.PREC_DIST         | A version of INST_RETIRED that allows for a more unbiased distribution of samples across instructions retired. It utilizes the Precise Distribution of Instructions Retired (PDIR) feature to mitigate some bias in how retired instructions get sampled. | Precise event capable<br>Requires PEBS on General Counter 1 (PDIR). |
| C1H        | 3FH         | OTHER_ASSISTS.ANY              | Number of times a microcode assist is invoked by HW other than FP-assist. Examples include AD (page Access Dirty) and AVX* related assists.   |   |
| C2H        | 01H         | UOPS_RETIRED.STALL_CYCLES      | This is a non-precise version (that is, does not use PEBS) of the event that counts cycles without actually retired uops.   | CounterMask=1<br>Invert=1 CMSK1, INV                                |
| C2H        | 01H         | UOPS_RETIRED.TOTAL_CYCLES      | Number of cycles using always true condition (uops_ret < 16) applied to non PEBS uops retired event.  | CounterMask=10<br>Invert=1 CMSK10, INV                              |
| C2H        | 02H         | UOPS_RETIRED.RETIRE_SLOTS      | Counts the retirement slots used.   |   |
| C3H        | 01H         | MACHINE_CLEARS.COUNT           | Number of machine clears (nukes) of any type.   | EdgeDetect=1<br>CounterMask=1<br>CMSK1, EDG                         |
| C3H        | 02H         | MACHINE_CLEARS.MEMORY_ORDERING | Counts the number of memory ordering Machine Clears detected. Memory Ordering Machine Clears can result from one of the following: a. memory disambiguation, b. external snoop, or c. cross SMT-HW-thread snoop (stores) hitting load buffer.             |   |
| C3H        | 04H         | MACHINE_CLEARS.SMC             | Counts self-modifying code (SMC) detected, which causes a machine clear.  |   |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES   | Counts all (macro) branch instructions retired.   | Precise event capable.<br>See Table 19-1.                           |
| C4H        | 01H         | BR_INST_RETIRED.CONDITIONAL    | This is a non-precise version (that is, does not use PEBS) of the event that counts conditional branch instructions retired.  | Precise event capable.<br>PS  |
| C4H        | 02H         | BR_INST_RETIRED.NEAR_CALL      | This is a non-precise version (that is, does not use PEBS) of the event that counts both direct and indirect near call instructions retired.  | Precise event capable.<br>PS  |
| C4H        | 08H         | BR_INST_RETIRED.NEAR_RETURN    | This is a non-precise version (that is, does not use PEBS) of the event that counts return instructions retired.  | Precise event capable.<br>PS  |
| C4H        | 10H         | BR_INST_RETIRED.NOT_TAKEN      | This is a non-precise version (that is, does not use PEBS) of the event that counts not taken branch instructions retired.  |   |
| C4H        | 20H         | BR_INST_RETIRED.NEAR_TAKEN     | This is a non-precise version (that is, does not use PEBS) of the event that counts taken branch instructions retired.  | Precise event capable.<br>PS  |
| C4H        | 40H         | BR_INST_RETIRED.FAR_BRANCH     | This is a non-precise version (that is, does not use PEBS) of the event that counts far branch instructions retired.  | Precise event capable.<br>PS  |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                | Description   | Comment                                   |
|------------|-------------|------------------------------------|---|---|
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANC<br>HES   | Counts all the retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor incorrectly predicts the destination of the branch. When the misprediction is discovered at execution, all the instructions executed in the wrong (speculative) path must be discarded, and the processor must start fetching from the correct path. | Precise event capable.<br>See Table 19-1. |
| C5H        | 01H         | BR_MISP_RETIRED.CONDITIONA<br>L    | This is a non-precise version (that is, does not use PEBS) of the event that counts mispredicted conditional branch instructions retired.   | Precise event capable.<br>PS              |
| C5H        | 02H         | BR_MISP_RETIRED.NEAR_CALL          | Counts both taken and not taken retired mispredicted direct and indirect near calls, including both register and memory indirect.   | Precise event capable.                    |
| C5H        | 20H         | BR_MISP_RETIRED.NEAR_TAKE<br>N     | Number of near branch instructions retired that were mispredicted and taken.  | Precise event capable.<br>PS              |
| C6H        | 01H         | FRONTEND_RETIRED.DSB_MISS          | Counts retired Instructions that experienced DSB (Decode stream buffer, i.e. the decoded instruction-cache) miss.   | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.L1I_MISS          | Retired Instructions who experienced Instruction L1 Cache true miss.  | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.L2_MISS           | Retired Instructions who experienced Instruction L2 Cache true miss.  | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.ITLB_MISS         | Counts retired Instructions that experienced iTLB (Instruction TLB) true miss.  | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.STLB_MIS<br>S     | Counts retired Instructions that experienced STLB (2nd level TLB) true miss.  | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_<br>GE_2  | Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 2 cycles which was not interrupted by a back-end stall.   | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_<br>GE_4  | Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 4 cycles which was not interrupted by a back-end stall.   | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_<br>GE_8  | Counts retired instructions that are delivered to the back end after a front-end stall of at least 8 cycles. During this period the front end delivered no uops.  | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_<br>GE_16 | Counts retired instructions that are delivered to the back end after a front-end stall of at least 16 cycles. During this period the front end delivered no uops.   | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_<br>GE_32 | Counts retired instructions that are delivered to the back end after a front-end stall of at least 32 cycles. During this period the front end delivered no uops.   | Precise event capable.                    |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_<br>GE_64 | Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 64 cycles which was not interrupted by a back-end stall.  | Precise event capable.                    |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                        | Description  | Comment  |
|------------|-------------|--|--|--|
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_GE_128            | Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 128 cycles which was not interrupted by a back-end stall.  | Precise event capable.                         |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_GE_256            | Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 256 cycles which was not interrupted by a back-end stall.  | Precise event capable.                         |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_GE_512            | Retired instructions that are fetched after an interval where the front end delivered no uops for a period of 512 cycles which was not interrupted by a back-end stall.  | Precise event capable.                         |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_GE_2_BUBBLES_GE_1 | Counts retired instructions that are delivered to the back end after the front end had at least 1 bubble-slot for a period of 2 cycles. A bubble-slot is an empty issue-pipeline slot while there was no RAT stall.  | Precise event capable.                         |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_GE_2_BUBBLES_GE_2 | Retired instructions that are fetched after an interval where the front end had at least 2 bubble-slots for a period of 2 cycles which was not interrupted by a back-end stall.  | Precise event capable.                         |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_GE_2_BUBBLES_GE_3 | Retired instructions that are fetched after an interval where the front end had at least 3 bubble-slots for a period of 2 cycles which was not interrupted by a back-end stall.  | Precise event capable.                         |
| C7H        | 01H         | FP_ARITH_INST_RETIRED.SCALAR_DOUBLE        | Number of SSE/AVX computational scalar double precision floating-point instructions retired. Each count represents 1 computation. Applies to SSE* and AVX* scalar double precision floating-point instructions: ADD SUB MUL DIV MIN MAX SQRT FM(N)ADD/SUB. FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.                      | Software may treat each count as one DP FLOP.  |
| C7H        | 02H         | FP_ARITH_INST_RETIRED.SCALAR_SINGLE        | Number of SSE/AVX computational scalar single precision floating-point instructions retired. Each count represents 1 computation. Applies to SSE* and AVX* scalar single precision floating-point instructions: ADD SUB MUL DIV MIN MAX RCP RSQRT SQRT FM(N)ADD/SUB. FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.            | Software may treat each count as one SP FLOP.  |
| C7H        | 04H         | FP_ARITH_INST_RETIRED.128B_PACKED_DOUBLE   | Number of SSE/AVX computational 128-bit packed double precision floating-point instructions retired. Each count represents 2 computations. Applies to SSE* and AVX* packed double precision floating-point instructions: ADD SUB MUL DIV MIN MAX SQRT DPP FM(N)ADD/SUB. DPP and FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element. | Software may treat each count as two DP FLOPs. |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                      | Description  | Comment  |
|------------|-------------|--|--|--|
| C7H        | 08H         | FP_ARITH_INST_RETIRED.128B_PACKED_SINGLE | Number of SSE/AVX computational 128-bit packed single precision floating-point instructions retired. Each count represents 4 computations. Applies to SSE* and AVX* packed single precision floating-point instructions: ADD SUB MUL DIV MIN MAX RCP RSQRT SQRT DPP FM(N)ADD/SUB. DPP and FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element. | Software may treat each count as four SP FLOPs.  |
| C7H        | 10H         | FP_ARITH_INST_RETIRED.256B_PACKED_DOUBLE | Number of SSE/AVX computational 256-bit packed double precision floating-point instructions retired. Each count represents 4 computations. Applies to SSE* and AVX* packed double precision floating-point instructions: ADD SUB MUL DIV MIN MAX SQRT DPP FM(N)ADD/SUB. DPP and FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element.           | Software may treat each count as four DP FLOPs.  |
| C7H        | 20H         | FP_ARITH_INST_RETIRED.256B_PACKED_SINGLE | Number of SSE/AVX computational 256-bit packed single precision floating-point instructions retired. Each count represents 8 computations. Applies to SSE* and AVX* packed single precision floating-point instructions: ADD SUB MUL DIV MIN MAX RCP RSQRT SQRT DPP FM(N)ADD/SUB. DPP and FM(N)ADD/SUB instructions count twice as they perform multiple calculations per element. | Software may treat each count as eight SP FLOPs. |
| C7H        | 40H         | FP_ARITH_INST_RETIRED.512B_PACKED_DOUBLE | Number of Packed Double-Precision FP arithmetic instructions (use operation multiplier of 8).  | Only applicable when AVX-512 is enabled.         |
| C7H        | 80H         | FP_ARITH_INST_RETIRED.512B_PACKED_SINGLE | Number of Packed Single-Precision FP arithmetic instructions (use operation multiplier of 16).   | Only applicable when AVX-512 is enabled.         |
| C8H        | 01H         | HLE_RETIRED.START                        | Number of times we entered an HLE region. Does not count nested transactions.  |  |
| C8H        | 02H         | HLE_RETIRED.COMMIT                       | Number of times HLE commit succeeded.  |  |
| C8H        | 04H         | HLE_RETIRED.ABORTED                      | Number of times HLE abort was triggered.   | Precise event capable.                           |
| C8H        | 08H         | HLE_RETIRED.ABORTED_MEM                  | Number of times an HLE execution aborted due to various memory events (e.g., read/write capacity and conflicts).   |  |
| C8H        | 10H         | HLE_RETIRED.ABORTED_TIMER                | Number of times an HLE execution aborted due to hardware timer expiration.   |  |
| C8H        | 20H         | HLE_RETIRED.ABORTED_UNFRIENDLY           | Number of times an HLE execution aborted due to HLE-unfriendly instructions and certain unfriendly events (such as AD assists etc.).   |  |
| C8H        | 40H         | HLE_RETIRED.ABORTED_MEMTYPE              | Number of times an HLE execution aborted due to incompatible memory type.  |  |
| C8H        | 80H         | HLE_RETIRED.ABORTED_EVENTS               | Number of times an HLE execution aborted due to unfriendly events (such as interrupts).  |  |
| C9H        | 01H         | RTM_RETIRED.START                        | Number of times we entered an RTM region. Does not count nested transactions.  |  |
| C9H        | 02H         | RTM_RETIRED.COMMIT                       | Number of times RTM commit succeeded.  |  |
| C9H        | 04H         | RTM_RETIRED.ABORTED                      | Number of times RTM abort was triggered.   | Precise event capable.                           |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description  | Comment   |
|------------|-------------|--|--|---|
| C9H        | 08H         | RTM_RETIREDA.BORTED_MEM                | Number of times an RTM execution aborted due to various memory events (e.g. read/write capacity and conflicts).  |   |
| C9H        | 10H         | RTM_RETIREDA.BORTED_TIMER              | Number of times an RTM execution aborted due to uncommon conditions.   |   |
| C9H        | 20H         | RTM_RETIREDA.BORTED_UNFRIENDLY         | Number of times an RTM execution aborted due to HLE-unfriendly instructions.   |   |
| C9H        | 40H         | RTM_RETIREDA.BORTED_MEMTYPE            | Number of times an RTM execution aborted due to incompatible memory type.  |   |
| C9H        | 80H         | RTM_RETIREDA.BORTED_EVENTS             | Number of times an RTM execution aborted due to none of the previous 4 categories (e.g. interrupt).  |   |
| CAH        | 1EH         | FP_ASSIST.ANY                          | Counts cycles with any input and output SSE or x87 FP assist. If an input and output assist are detected on the same cycle the event increments by 1.  | CounterMask=1<br>CMSK1                                |
| CBH        | 01H         | HW_INTERRUPTS.RECEIVED                 | Counts the number of hardware interruptions received by the processor.   |   |
| CCH        | 20H         | ROB_MISC_EVENTS.LBR_INSERTS            | Increments when an entry is added to the Last Branch Record (LBR) array (or removed from the array in case of RETURNS in call stack mode). The event requires LBR enable via IA32_DEBUGCTL MSR and branch type selection via MSR_LBR_SELECT. |   |
| CDH        | 01H         | MEM_TRANS_RETIREDA.LOAD_LATENCY_GT_4   | Counts loads when the latency from first dispatch to completion is greater than 4 cycles. Reported latency may be longer than just the memory latency.   | Precise event capable. Specify threshold in MSR 3F6H. |
| CDH        | 01H         | MEM_TRANS_RETIREDA.LOAD_LATENCY_GT_8   | Counts loads when the latency from first dispatch to completion is greater than 8 cycles. Reported latency may be longer than just the memory latency.   | Precise event capable. Specify threshold in MSR 3F6H. |
| CDH        | 01H         | MEM_TRANS_RETIREDA.LOAD_LATENCY_GT_16  | Counts loads when the latency from first dispatch to completion is greater than 16 cycles. Reported latency may be longer than just the memory latency.  | Precise event capable. Specify threshold in MSR 3F6H. |
| CDH        | 01H         | MEM_TRANS_RETIREDA.LOAD_LATENCY_GT_32  | Counts loads when the latency from first dispatch to completion is greater than 32 cycles. Reported latency may be longer than just the memory latency.  | Precise event capable. Specify threshold in MSR 3F6H. |
| CDH        | 01H         | MEM_TRANS_RETIREDA.LOAD_LATENCY_GT_64  | Counts loads when the latency from first dispatch to completion is greater than 64 cycles. Reported latency may be longer than just the memory latency.  | Precise event capable. Specify threshold in MSR 3F6H. |
| CDH        | 01H         | MEM_TRANS_RETIREDA.LOAD_LATENCY_GT_128 | Counts loads when the latency from first dispatch to completion is greater than 128 cycles. Reported latency may be longer than just the memory latency.   | Precise event capable. Specify threshold in MSR 3F6H. |
| CDH        | 01H         | MEM_TRANS_RETIREDA.LOAD_LATENCY_GT_256 | Counts loads when the latency from first dispatch to completion is greater than 256 cycles. Reported latency may be longer than just the memory latency.   | Precise event capable. Specify threshold in MSR 3F6H. |
| CDH        | 01H         | MEM_TRANS_RETIREDA.LOAD_LATENCY_GT_512 | Counts loads when the latency from first dispatch to completion is greater than 512 cycles. Reported latency may be longer than just the memory latency.   | Precise event capable. Specify threshold in MSR 3F6H. |
| DOH        | 11H         | MEM_INST_RETIREDA.STLB_MISS_LOADS      | Retired load instructions that miss the STLB.  | Precise event capable. PSDLA                          |

**Table 19-3. Performance Events of the Processor Core Supported in  
Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                  | Description  | Comment                      |
|------------|-------------|--------------------------------------|--|------------------------------|
| D0H        | 12H         | MEM_INST_RETIRED.STLB_MISS_STORES    | Retired store instructions that miss the STLB.   | Precise event capable. PSDLA |
| D0H        | 21H         | MEM_INST_RETIRED.LOCK_LOADS          | Retired load instructions with locked access.  | Precise event capable. PSDLA |
| D0H        | 41H         | MEM_INST_RETIRED.SPLIT_LOADS         | Counts retired load instructions that split across a cacheline boundary.   | Precise event capable. PSDLA |
| D0H        | 42H         | MEM_INST_RETIRED.SPLIT_STORES        | Counts retired store instructions that split across a cacheline boundary.  | Precise event capable. PSDLA |
| D0H        | 81H         | MEM_INST_RETIRED.ALL_LOADS           | All retired load instructions.   | Precise event capable. PSDLA |
| D0H        | 82H         | MEM_INST_RETIRED.ALL_STORES          | All retired store instructions.  | Precise event capable. PSDLA |
| D1H        | 01H         | MEM_LOAD_RETIRED.L1_HIT              | Counts retired load instructions with at least one uop that hit in the L1 data cache. This event includes all SW prefetches and lock instructions regardless of the data source. | Precise event capable. PSDLA |
| D1H        | 02H         | MEM_LOAD_RETIRED.L2_HIT              | Retired load instructions with L2 cache hits as data sources.  | Precise event capable. PSDLA |
| D1H        | 04H         | MEM_LOAD_RETIRED.L3_HIT              | Counts retired load instructions with at least one uop that hit in the L3 cache.   | Precise event capable. PSDLA |
| D1H        | 08H         | MEM_LOAD_RETIRED.L1_MISS             | Counts retired load instructions with at least one uop that missed in the L1 cache.  | Precise event capable. PSDLA |
| D1H        | 10H         | MEM_LOAD_RETIRED.L2_MISS             | Retired load instructions missed L2 cache as data sources.   | Precise event capable. PSDLA |
| D1H        | 20H         | MEM_LOAD_RETIRED.L3_MISS             | Counts retired load instructions with at least one uop that missed in the L3 cache.  | Precise event capable. PSDLA |
| D1H        | 40H         | MEM_LOAD_RETIRED.FB_HIT              | Counts retired load instructions with at least one uop was load missed in L1 but hit FB (Fill Buffers) due to preceding miss to the same cache line with data not ready.         | Precise event capable. PSDLA |
| D2H        | 01H         | MEM_LOAD_L3_HIT_RETIRED.XSNP_MISS    | Retired load instructions which data sources were L3 hit and cross-core snoop missed in on-pkg core cache.   | Precise event capable. PSDLA |
| D2H        | 02H         | MEM_LOAD_L3_HIT_RETIRED.XSNP_HIT     | Retired load instructions which data sources were L3 and cross-core snoop hits in on-pkg core cache.   | Precise event capable. PSDLA |
| D2H        | 04H         | MEM_LOAD_L3_HIT_RETIRED.XSNP_HITM    | Retired load instructions which data sources were HitM responses from shared L3.   | Precise event capable. PSDLA |
| D2H        | 08H         | MEM_LOAD_L3_HIT_RETIRED.XSNP_NONE    | Retired load instructions which data sources were hits in L3 without snoops required.  | Precise event capable. PSDLA |
| D3H        | 01H         | MEM_LOAD_L3_MISS_RETIRED.LOCAL_DRAM  | Retired load instructions which data sources missed L3 but serviced from local DRAM.   | Precise event capable.       |
| D3H        | 02H         | MEM_LOAD_L3_MISS_RETIRED.REMOTE_DRAM | Retired load instructions which data sources missed L3 but serviced from remote dram.  | Precise event capable.       |
| D3H        | 04H         | MEM_LOAD_L3_MISS_RETIRED.REMOTE_HITM | Retired load instructions whose data sources was remote HITM.  | Precise event capable.       |
| D3H        | 08H         | MEM_LOAD_L3_MISS_RETIRED.REMOTE_FWD  | Retired load instructions whose data sources was forwarded from a remote cache.  |                              |

**Table 19-3. Performance Events of the Processor Core Supported in Intel® Xeon® Processor Scalable Family with Skylake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic       | Description  | Comment                |
|------------|-------------|---------------------------|--|------------------------|
| D4H        | 04H         | MEM_LOAD_MISC_RETIRED.UC  | Retired instructions with at least 1 uncacheable load or lock.   | Precise event capable. |
| E6H        | 01H         | BACLEAR.S.ANY             | Counts the number of times the front-end is re-steered when it finds a branch instruction in a fetch line. This occurs for the first time a branch instruction is fetched or when the branch is not tracked by the BPU (Branch Prediction Unit) anymore.   |                        |
| F0H        | 40H         | L2_TRANS.L2_WB            | Counts L2 writebacks that access L2 cache.   |                        |
| F1H        | 1FH         | L2_LINES_IN.ALL           | Counts the number of L2 cache lines filling the L2. Counting does not cover rejects.   |                        |
| F2H        | 01H         | L2_LINES_OUT.SILENT       | Counts the number of lines that are silently dropped by L2 cache when triggered by an L2 cache fill. These lines are typically in Shared state. A non-threaded event.  |                        |
| F2H        | 02H         | L2_LINES_OUT.NON_SILENT   | Counts the number of lines that are evicted by L2 cache when triggered by an L2 cache fill. Those lines can be either in modified state or clean state. Modified lines may either be written back to L3 or directly written to memory and not allocated in L3. Clean lines may either be allocated in L3 or dropped. |                        |
| F2H        | 04H         | L2_LINES_OUT.USELESS_PREF | Counts the number of lines that have been hardware prefetched but not used and now evicted by L2 cache.  |                        |
| F2H        | 04H         | L2_LINES_OUT.USELESS_HWPF | Counts the number of lines that have been hardware prefetched but not used and now evicted by L2 cache.  |                        |
| F4H        | 10H         | SQ_MISC.SPLIT_LOCK        | Counts the number of cache line split locks sent to the uncore.  |                        |
| FEH        | 02H         | IDI_MISC.WB_UPGRADE       | Counts number of cache lines that are allocated and written back to L3 with the intention that they are more likely to be reused shortly.  |                        |
| FEH        | 04H         | IDI_MISC.WB_DOWNGRADE     | Counts number of cache lines that are dropped and not written back to L3 as they are deemed to be less likely to be reused shortly.  |                        |

## 19.3 PERFORMANCE MONITORING EVENTS FOR 6TH GENERATION INTEL® CORE™ PROCESSOR AND 7TH GENERATION INTEL® CORE™ PROCESSOR

6th Generation Intel® Core™ processors are based on the Skylake microarchitecture. They support the architectural performance monitoring events listed in Table 19-1. Fixed counters in the core PMU support the architecture events defined in Table 19-2. Model-specific performance monitoring events in the processor core are listed in Table 19-4. The events in Table 19-4 apply to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following values: 06\_4EH and 06\_5EH. Table 19-10 lists performance events supporting Intel TSX (see Section 18.3.6.5) and the events are applicable to processors based on Skylake microarchitecture. Where Skylake microarchitecture implements TSX-related event semantics that differ from Table 19-10, they are listed in Table 19-5.

7th Generation Intel® Core™ processors are based on the Kaby Lake microarchitecture. Model-specific performance monitoring events in the processor core are listed in Table 19-4. The events in Table 19-4 apply to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following values: 06\_8EH and 06\_9EH.

The comment column in Table 19-4 uses abbreviated letters to indicate additional conditions applicable to the Event Mask Mnemonic. For event umasks listed in Table 19-4 that do not show “AnyT”, users should refrain from programming “AnyThread = 1” in IA32\_PERF\_EVTSELx.

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic                 | Description   | Comment    |
|------------|-------------|-------------------------------------|---|------------|
| 03H        | 02H         | LD_BLOCKS.STORE_FORWARD             | Loads blocked by overlapping with store buffer that cannot be forwarded.  |            |
| 03H        | 08H         | LD_BLOCKS.NO_SR                     | The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.                                  |            |
| 07H        | 01H         | LD_BLOCKS_PARTIAL.ADDRESS_ALIAS     | False dependencies in MOB due to partial compare on address.  |            |
| 08H        | 01H         | DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK | Load misses in all TLB levels that cause a page walk of any page size.  |            |
| 08H        | 0EH         | DTLB_LOAD_MISSES.WALK_COMPLETED     | Load misses in all TLB levels causes a page walk that completes. (All page sizes.)  |            |
| 08H        | 10H         | DTLB_LOAD_MISSES.WALK_PENDING       | Counts 1 per cycle for each PMH that is busy with a page walk for a load.   |            |
| 08H        | 10H         | DTLB_LOAD_MISSES.WALK_ACTIVE        | Cycles when at least one PMH is busy with a walk for a load.  | CMSK1      |
| 08H        | 20H         | DTLB_LOAD_MISSES.STLB_HIT           | Loads that miss the DTLB but hit STLB.  |            |
| 0DH        | 01H         | INT_MISC.RECOVERY_CYCLES            | Core cycles the allocator was stalled due to recovery from earlier machine clear event for this thread (for example, misprediction or memory order conflict).             |            |
| 0DH        | 01H         | INT_MISC.RECOVERY_CYCLES_ANY        | Core cycles the allocator was stalled due to recovery from earlier machine clear event for any logical thread in this processor core.                                     | AnyT       |
| 0DH        | 80H         | INT_MISC.CLEAR_RESTEER_CYCLES       | Cycles the issue-stage is waiting for front end to fetch from resteeered path following branch misprediction or machine clear events.                                     |            |
| 0EH        | 01H         | UOPS_ISSUED.ANY                     | The number of uops issued by the RAT to RS.   |            |
| 0EH        | 01H         | UOPS_ISSUED.STALL_CYCLES            | Cycles when the RAT does not issue uops to RS for the thread.   | CMSK1, INV |
| 0EH        | 02H         | UOPS_ISSUED.VECTOR_WIDTH_MISMATCH   | Uops inserted at issue-stage in order to preserve upper bits of vector registers.   |            |
| 0EH        | 20H         | UOPS_ISSUED.SLOW_LEA                | Number of slow LEA or similar uops allocated. Such uop has 3 sources (for example, 2 sources + immediate) regardless of whether it is a result of LEA instruction or not. |            |
| 14H        | 01H         | ARITH.FPU_DIVIDER_ACTIVE            | Cycles when divider is busy executing divide or square root operations. Accounts for FP operations including integer divides.   |            |
| 24H        | 21H         | L2_RQSTS.DEMAND_DATA_RD_MISS        | Demand Data Read requests that missed L2, no rejects.   |            |
| 24H        | 22H         | L2_RQSTS.RFO_MISS                   | RFO requests that missed L2.  |            |
| 24H        | 24H         | L2_RQSTS.CODE_RD_MISS               | L2 cache misses when fetching instructions.   |            |
| 24H        | 27H         | L2_RQSTS.ALL_DEMAND_MISS            | Demand requests that missed L2.   |            |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                       | Description   | Comment         |
|------------|-------------|---|---|-----------------|
| 24H        | 38H         | L2_RQSTS.PF_MISS                          | Requests from the L1/L2/L3 hardware prefetchers or load software prefetches that miss L2 cache.   |                 |
| 24H        | 3FH         | L2_RQSTS.MISS                             | All requests that missed L2.  |                 |
| 24H        | 41H         | L2_RQSTS.DEMAND_DATA_RD_HIT               | Demand Data Read requests that hit L2 cache.  |                 |
| 24H        | 42H         | L2_RQSTS.RFO_HIT                          | RFO requests that hit L2 cache.   |                 |
| 24H        | 44H         | L2_RQSTS.CODE_RD_HIT                      | L2 cache hits when fetching instructions.   |                 |
| 24H        | D8H         | L2_RQSTS.PF_HIT                           | Prefetches that hit L2.   |                 |
| 24H        | E1H         | L2_RQSTS.ALL_DEMAND_DATA_RD               | All demand data read requests to L2.  |                 |
| 24H        | E2H         | L2_RQSTS.ALL_RFO                          | All L RFO requests to L2.   |                 |
| 24H        | E4H         | L2_RQSTS.ALL_CODE_RD                      | All L2 code requests.   |                 |
| 24H        | E7H         | L2_RQSTS.ALL_DEMAND_REFERENCES            | All demand requests to L2.  |                 |
| 24H        | F8H         | L2_RQSTS.ALL_PF                           | All requests from the L1/L2/L3 hardware prefetchers or load software prefetches.  |                 |
| 24H        | EFH         | L2_RQSTS.REFERENCES                       | All requests to L2.   |                 |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFERENCE               | This event counts requests originating from the core that reference a cache line in the L3 cache.   | See Table 19-1. |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS                    | This event counts each cache miss condition for references to the L3 cache.   | See Table 19-1. |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P                 | Cycles while the logical processor is not in a halt state.  | See Table 19-1. |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P_ANY             | Cycles while at least one logical processor is not in a halt state.   | AnyT            |
| 3CH        | 01H         | CPU_CLK_THREAD_UNHALTED.REF_XCLK          | Core crystal clock cycles when the thread is unhalted.  | See Table 19-1. |
| 3CH        | 01H         | CPU_CLK_THREAD_UNHALTED.REF_XCLK_ANY      | Core crystal clock cycles when at least one thread on the physical core is unhalted.  | AnyT            |
| 3CH        | 02H         | CPU_CLK_THREAD_UNHALTED.ONE_THREAD_ACTIVE | Core crystal clock cycles when this thread is unhalted and the other thread is halted.  |                 |
| 48H        | 01H         | L1D_PEND_MISS.PENDING                     | Increments the number of outstanding L1D misses every cycle.  |                 |
| 48H        | 01H         | L1D_PEND_MISS.PENDING_CYCLES              | Cycles with at least one outstanding L1D misses from this logical processor.  | CMSK1           |
| 48H        | 01H         | L1D_PEND_MISS.PENDING_CYCLES_ANY          | Cycles with at least one outstanding L1D misses from any logical processor in this core.  | CMSK1, AnyT     |
| 48H        | 02H         | L1D_PEND_MISS.FB_FULL                     | Number of times a request needed a FB entry but there was no entry available for it. That is, the FB unavailability was the dominant reason for blocking the request. A request includes cacheable/uncacheable demand that is load, store or SW prefetch. HWP are excluded. |                 |
| 49H        | 01H         | DTLB_STORE_MISSES.MISS_CAUSES_A_WALK      | Store misses in all TLB levels that cause page walks.   |                 |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                                     | Description  | Comment    |
|------------|-------------|---|--|------------|
| 49H        | 0EH         | DTLB_STORE_MISSES.WALK_COMPLETED                        | Counts completed page walks in any TLB levels due to store misses (all page sizes).  |            |
| 49H        | 10H         | DTLB_STORE_MISSES.WALK_PENDING                          | Counts 1 per cycle for each PMH that is busy with a page walk for a store.   |            |
| 49H        | 10H         | DTLB_STORE_MISSES.WALK_ACTIVE                           | Cycles when at least one PMH is busy with a page walk for a store.   | CMSK1      |
| 49H        | 20H         | DTLB_STORE_MISSES.STLB_HIT                              | Store misses that missed DTLB but hit STLB.  |            |
| 4CH        | 01H         | LOAD_HIT_PRE.HW_PF                                      | Demand load dispatches that hit fill buffer allocated for software prefetch.   |            |
| 4FH        | 10H         | EPT.WALK_PENDING  | Counts 1 per cycle for each PMH that is busy with an EPT walk for any request type.  |            |
| 51H        | 01H         | L1D.REPLACEMENT   | Counts the number of lines brought into the L1 data cache.   |            |
| 5EH        | 01H         | RS_EVENTS.EMPTY_CYCLES                                  | Cycles the RS is empty for the thread.   |            |
| 5EH        | 01H         | RS_EVENTS.EMPTY_END                                     | Counts end of periods where the Reservation Station (RS) was empty. Could be useful to precisely locate Front-end Latency Bound issues.  | CMSK1, INV |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD             | Increment each cycle of the number of offcore outstanding Demand Data Read transactions in SQ to uncure.                                 |            |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_DATA_RD | Cycles with at least one offcore outstanding Demand Data Read transactions in SQ to uncure.  | CMSK1      |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD_GE_6        | Cycles with at least 6 offcore outstanding Demand Data Read transactions in SQ to uncure.  | CMSK6      |
| 60H        | 02H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_CODE_RD             | Increment each cycle of the number of offcore outstanding demand code read transactions in SQ to uncure.                                 |            |
| 60H        | 02H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_CODE_RD | Cycles with at least one offcore outstanding demand code read transactions in SQ to uncure.  | CMSK1      |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO                 | Increment each cycle of the number of offcore outstanding RFO store transactions in SQ to uncure. Set Cmask=1 to count cycles.           |            |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DEMAND_RFO     | Cycles with at least one offcore outstanding RFO transactions in SQ to uncure.   | CMSK1      |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD                | Increment each cycle of the number of offcore outstanding cacheable data read transactions in SQ to uncure. Set Cmask=1 to count cycles. |            |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_DATA_RD        | Cycles with at least one offcore outstanding data read transactions in SQ to uncure.   | CMSK1      |
| 60H        | 10H         | OFFCORE_REQUESTS_OUTSTANDING.L3_MISS_DEMAND_DATA_RD     | Increment each cycle of the number of offcore outstanding demand data read requests from SQ that missed L3.                              |            |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic   | Description   | Comment |
|------------|-------------|---|---|---------|
| 60H        | 10H         | OFFCORE_REQUESTS_OUTSTANDING.CYCLES_WITH_L3_MISS_DEMAND_DATA_RD | Cycles with at least one offcore outstanding demand data read requests from SQ that missed L3.                    | CMSK1   |
| 60H        | 10H         | OFFCORE_REQUESTS_OUTSTANDING.L3_MISS_DEMAND_DATA_RD_GE_6        | Cycles with at least one offcore outstanding demand data read requests from SQ that missed L3.                    | CMSK6   |
| 63H        | 02H         | LOCK_CYCLES.CACHE_LOCK_DURATION                                 | Cycles in which the L1D is locked.  |         |
| 79H        | 04H         | IDQ.MITE_UOPS   | Increment each cycle # of uops delivered to IDQ from MITE path.   |         |
| 79H        | 04H         | IDQ.MITE_CYCLES   | Cycles when uops are being delivered to IDQ from MITE path.   | CMSK1   |
| 79H        | 08H         | IDQ.DSB_UOPS  | Increment each cycle. # of uops delivered to IDQ from DSB path.   |         |
| 79H        | 08H         | IDQ.DSB_CYCLES  | Cycles when uops are being delivered to IDQ from DSB path.  | CMSK1   |
| 79H        | 10H         | IDQ.MS_DSB_UOPS   | Increment each cycle # of uops delivered to IDQ by DSB when MS_busy.  |         |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_ANY_UOPS                                     | Cycles DSB is delivered at least one uops.  | CMSK1   |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_4_UOPS                                       | Cycles DSB is delivered four uops.  | CMSK4   |
| 79H        | 20H         | IDQ.MS_MITE_UOPS  | Increment each cycle # of uops delivered to IDQ by MITE when MS_busy.   |         |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_ANY_UOPS                                    | Counts cycles MITE is delivered at least one uops.  | CMSK1   |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_4_UOPS                                      | Counts cycles MITE is delivered four uops.  | CMSK4   |
| 79H        | 30H         | IDQ.MS_UOPS   | Increment each cycle # of uops delivered to IDQ while MS is busy.   |         |
| 79H        | 30H         | IDQ.MS_SWITCHES   | Number of switches from DSB or MITE to MS.  | EDG     |
| 79H        | 30H         | IDQ.MS_CYCLES   | Cycles MS is delivered at least one uops.   | CMSK1   |
| 80H        | 04H         | ICACHE_16B.IFDATA_STALL   | Cycles where a code fetch is stalled due to L1 instruction cache miss.  |         |
| 80H        | 04H         | ICACHE_64B.IFDATA_STALL   | Cycles where a code fetch is stalled due to L1 instruction cache tag miss.  |         |
| 83H        | 01H         | ICACHE_64B.IFTAG_HIT  | Instruction fetch tag lookups that hit in the instruction cache (L1I). Counts at 64-byte cache-line granularity.  |         |
| 83H        | 02H         | ICACHE_64B.IFTAG_MISS   | Instruction fetch tag lookups that miss in the instruction cache (L1I). Counts at 64-byte cache-line granularity. |         |
| 85H        | 01H         | ITLB_MISSES.MISS_CAUSES_A_WALK                                  | Misses at all ITLB levels that cause page walks.  |         |
| 85H        | 0EH         | ITLB_MISSES.WALK_COMPLETED                                      | Counts completed page walks in any TLB level due to code fetch misses (all page sizes).                           |         |
| 85H        | 10H         | ITLB_MISSES.WALK_PENDING  | Counts 1 per cycle for each PMH that is busy with a page walk for an instruction fetch request.                   |         |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                                   | Description  | Comment                     |
|------------|-------------|---|--|-----------------------------|
| 85H        | 20H         | ITLB_MISSES.STLB_HIT                                  | ITLB misses that hit STLB.   |                             |
| 87H        | 01H         | ILD_STALL.LCP   | Stalls caused by changing prefix length of the instruction.  |                             |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CO<br>RE                       | Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back-end stall.        |                             |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CYC<br>LES_O_UOP_DELIV.CORE    | Cycles which 4 issue pipeline slots had no uop delivered from the front end to the back end when there is no back-end stall.     | CMSK4                       |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CYC<br>LES_LE_n_UOP_DELIV.CORE | Cycles which "4-n" issue pipeline slots had no uop delivered from the front end to the back end when there is no back-end stall. | Set CMSK = 4-n; n = 1, 2, 3 |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CYC<br>LES_FE_WAS_OK           | Cycles which front end delivered 4 uops or the RAT was stalling FE.  | CMSK, INV                   |
| A1H        | 01H         | UOPS_DISPATCHED_PORT.PORT<br>_0                       | Counts the number of cycles in which a uop is dispatched to port 0.  |                             |
| A1H        | 02H         | UOPS_DISPATCHED_PORT.PORT<br>_1                       | Counts the number of cycles in which a uop is dispatched to port 1.  |                             |
| A1H        | 04H         | UOPS_DISPATCHED_PORT.PORT<br>_2                       | Counts the number of cycles in which a uop is dispatched to port 2.  |                             |
| A1H        | 08H         | UOPS_DISPATCHED_PORT.PORT<br>_3                       | Counts the number of cycles in which a uop is dispatched to port 3.  |                             |
| A1H        | 10H         | UOPS_DISPATCHED_PORT.PORT<br>_4                       | Counts the number of cycles in which a uop is dispatched to port 4.  |                             |
| A1H        | 20H         | UOPS_DISPATCHED_PORT.PORT<br>_5                       | Counts the number of cycles in which a uop is dispatched to port 5.  |                             |
| A1H        | 40H         | UOPS_DISPATCHED_PORT.PORT<br>_6                       | Counts the number of cycles in which a uop is dispatched to port 6.  |                             |
| A1H        | 80H         | UOPS_DISPATCHED_PORT.PORT<br>_7                       | Counts the number of cycles in which a uop is dispatched to port 7.  |                             |
| A2H        | 01H         | RESOURCE_STALLS.ANY                                   | Resource-related stall cycles.   |                             |
| A2H        | 08H         | RESOURCE_STALLS.SB                                    | Cycles stalled due to no store buffers available (not including draining from sync).   |                             |
| A3H        | 01H         | CYCLE_ACTIVITY.CYCLES_L2_MI<br>SS                     | Cycles while L2 cache miss demand load is outstanding.   | CMSK1                       |
| A3H        | 02H         | CYCLE_ACTIVITY.CYCLES_L3_MI<br>SS                     | Cycles while L3 cache miss demand load is outstanding.   | CMSK2                       |
| A3H        | 04H         | CYCLE_ACTIVITY.STALLS_TOTAL                           | Total execution stalls.  | CMSK4                       |
| A3H        | 05H         | CYCLE_ACTIVITY.STALLS_L2_MI<br>SS                     | Execution stalls while L2 cache miss demand load is outstanding.   | CMSK5                       |
| A3H        | 06H         | CYCLE_ACTIVITY.STALLS_L3_MI<br>SS                     | Execution stalls while L3 cache miss demand load is outstanding.   | CMSK6                       |
| A3H        | 08H         | CYCLE_ACTIVITY.CYCLES_L1D_M<br>ISS                    | Cycles while L1 data cache miss demand load is outstanding.  | CMSK8                       |
| A3H        | 0CH         | CYCLE_ACTIVITY.STALLS_L1D_M<br>ISS                    | Execution stalls while L1 data cache miss demand load is outstanding.  | CMSK12                      |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                     | Description   | Comment   |
|------------|-------------|---|---|-----------|
| A3H        | 10H         | CYCLE_ACTIVITY.CYCLES_MEM_ANY           | Cycles while memory subsystem has an outstanding load.  | CMSK16    |
| A3H        | 14H         | CYCLE_ACTIVITY.STALLS_MEM_ANY           | Execution stalls while memory subsystem has an outstanding load.  | CMSK20    |
| A6H        | 01H         | EXE_ACTIVITY.EXE_BOUND_0_PORTS          | Cycles for which no uops began execution, the Reservation Station was not empty, the Store Buffer was full and there was no outstanding load. |           |
| A6H        | 02H         | EXE_ACTIVITY.1_PORTS_UTIL               | Cycles for which one uop began execution on any port, and the Reservation Station was not empty.  |           |
| A6H        | 04H         | EXE_ACTIVITY.2_PORTS_UTIL               | Cycles for which two uops began execution, and the Reservation Station was not empty.   |           |
| A6H        | 08H         | EXE_ACTIVITY.3_PORTS_UTIL               | Cycles for which three uops began execution, and the Reservation Station was not empty.   |           |
| A6H        | 04H         | EXE_ACTIVITY.4_PORTS_UTIL               | Cycles for which four uops began execution, and the Reservation Station was not empty.  |           |
| A6H        | 40H         | EXE_ACTIVITY.BOUND_ON_STORES            | Cycles where the Store Buffer was full and no outstanding load.   |           |
| A8H        | 01H         | LSD.UOPS                                | Number of uops delivered by the LSD.  |           |
| A8H        | 01H         | LSD.CYCLES_ACTIVE                       | Cycles with at least one uop delivered by the LSD and none from the decoder.  | CMSK1     |
| A8H        | 01H         | LSD.CYCLES_4_UOPS                       | Cycles with 4 uops delivered by the LSD and none from the decoder.  | CMSK4     |
| ABH        | 02H         | DSB2MITE_SWITCHES.PENALTY_CYCLES        | DSB-to-MITE switch true penalty cycles.   |           |
| AEH        | 01H         | ITLB.ITLB_FLUSH                         | Flushing of the Instruction TLB (ITLB) pages, includes 4k/2M/4M pages.  |           |
| B0H        | 01H         | OFFCORE_REQUESTS.DEMAND_DATA_RD         | Demand data read requests sent to uncore.   |           |
| B0H        | 02H         | OFFCORE_REQUESTS.DEMAND_CODE_RD         | Demand code read requests sent to uncore.   |           |
| B0H        | 04H         | OFFCORE_REQUESTS.DEMAND_RFO             | Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.   |           |
| B0H        | 08H         | OFFCORE_REQUESTS.ALL_DATA_RD            | Data read requests sent to uncore (demand and prefetch).  |           |
| B0H        | 10H         | OFFCORE_REQUESTS.L3_MISS_DEMAND_DATA_RD | Demand data read requests that missed L3.   |           |
| B0H        | 80H         | OFFCORE_REQUESTS.ALL_REQUESTS           | Any memory transaction that reached the SQ.   |           |
| B1H        | 01H         | UOPS_EXECUTED.THREAD                    | Counts the number of uops that begin execution across all ports.  |           |
| B1H        | 01H         | UOPS_EXECUTED.STALL_CYCLES              | Cycles where there were no uops that began execution.   | CMSK, INV |
| B1H        | 01H         | UOPS_EXECUTED.CYCLES_GE_1_UOP_EXEC      | Cycles where there was at least one uop that began execution.   | CMSK1     |
| B1H        | 01H         | UOPS_EXECUTED.CYCLES_GE_2_UOP_EXEC      | Cycles where there were at least two uops that began execution.   | CMSK2     |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                | Description   | Comment            |
|------------|-------------|------------------------------------|---|--------------------|
| B1H        | 01H         | UOPS_EXECUTED.CYCLES_GE_3_UOP_EXEC | Cycles where there were at least three uops that began execution.   | CMSK3              |
| B1H        | 01H         | UOPS_EXECUTED.CYCLES_GE_4_UOP_EXEC | Cycles where there were at least four uops that began execution.  | CMSK4              |
| B1H        | 02H         | UOPS_EXECUTED.CORE                 | Counts the number of uops from any logical processor in this core that begin execution.   |                    |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_GE_1     | Cycles where there was at least one uop, from any logical processor in this core, that began execution.                                     | CMSK1              |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_GE_2     | Cycles where there were at least two uops, from any logical processor in this core, that began execution.                                   | CMSK2              |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_GE_3     | Cycles where there were at least three uops, from any logical processor in this core, that began execution.                                 | CMSK3              |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_GE_4     | Cycles where there were at least four uops, from any logical processor in this core, that began execution.                                  | CMSK4              |
| B1H        | 02H         | UOPS_EXECUTED.CORE_CYCLES_NONE     | Cycles where there were no uops from any logical processor in this core that began execution.   | CMSK1, INV         |
| B1H        | 10H         | UOPS_EXECUTED.X87                  | Counts the number of X87 uops that begin execution.   |                    |
| B2H        | 01H         | OFF_CORE_REQUEST_BUFFER.SQ_FULL    | Offcore requests buffer cannot take more entries for this core.   |                    |
| B7H        | 01H         | OFF_CORE_RESPONSE_0                | See Section 18.3.4.5, "Off-core Response Performance Monitoring".   | Requires MSR 01A6H |
| BBH        | 01H         | OFF_CORE_RESPONSE_1                | See Section 18.3.4.5, "Off-core Response Performance Monitoring".   | Requires MSR 01A7H |
| BDH        | 01H         | TLB_FLUSH.DTLB_THREAD              | DTLB flush attempts of the thread-specific entries.   |                    |
| BDH        | 01H         | TLB_FLUSH.STLB_ANY                 | STLB flush attempts.  |                    |
| COH        | 00H         | INST_RETIRED.ANY_P                 | Number of instructions at retirement.   | See Table 19-1.    |
| COH        | 01H         | INST_RETIRED.PREC_DIST             | Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.   | PMC1 only;         |
| COH        | 01H         | INST_RETIRED.TOTAL_CYCLES          | Number of cycles using always true condition applied to PEBS instructions retired event.  | CMSK10, PS         |
| C1H        | 3FH         | OTHER_ASSISTS.ANY                  | Number of times a microcode assist is invoked by HW other than FP-assist. Examples include AD (page Access Dirty) and AVX* related assists. |                    |
| C2H        | 01H         | UOPS_RETIRED.STALL_CYCLES          | Cycles without actually retired uops.   | CMSK1, INV         |
| C2H        | 01H         | UOPS_RETIRED.TOTAL_CYCLES          | Cycles with less than 10 actually retired uops.   | CMSK10, INV        |
| C2H        | 02H         | UOPS_RETIRED.RETIRE_SLOTS          | Retirement slots used.  |                    |
| C3H        | 01H         | MACHINE_CLEAR.SMC                  | Number of machine clears of any type.   | CMSK1, EDG         |
| C3H        | 02H         | MACHINE_CLEAR.MEMORY_ORDERING      | Counts the number of machine clears due to memory order conflicts.  |                    |
| C3H        | 04H         | MACHINE_CLEAR.SMC                  | Number of self-modifying-code machine clears detected.  |                    |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES       | Branch instructions that retired.   | See Table 19-1.    |
| C4H        | 01H         | BR_INST_RETIRED.CONDITIONAL        | Counts the number of conditional branch instructions retired.   | PS                 |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                            | Description  | Comment                                       |
|------------|-------------|--|--|---|
| C4H        | 02H         | BR_INST_RETIRED.NEAR_CALL                      | Direct and indirect near call instructions retired.  | PS  |
| C4H        | 04H         | BR_INST_RETIRED.ALL_BRANC<br>HES               | Counts the number of branch instructions retired.  | PS  |
| C4H        | 08H         | BR_INST_RETIRED.NEAR_RETU<br>RN                | Counts the number of near return instructions retired.   | PS  |
| C4H        | 10H         | BR_INST_RETIRED.NOT_TAKEN                      | Counts the number of not taken branch instructions retired.  |   |
| C4H        | 20H         | BR_INST_RETIRED.NEAR_TAKE<br>N                 | Number of near taken branches retired.   | PS  |
| C4H        | 40H         | BR_INST_RETIRED.FAR_BRANC<br>H                 | Number of far branches retired.  | PS  |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANC<br>HES               | Mispredicted branch instructions at retirement.  | See Table 19-1.                               |
| C5H        | 01H         | BR_MISP_RETIRED.CONDITIONA<br>L                | Mispredicted conditional branch instructions retired.  | PS  |
| C5H        | 04H         | BR_MISP_RETIRED.ALL_BRANC<br>HES               | Mispredicted macro branch instructions retired.  | PS  |
| C5H        | 20H         | BR_MISP_RETIRED.NEAR_TAKE<br>N                 | Number of near branch instructions retired that were mispredicted and taken.   | PS  |
| C6H        | 01H         | FRONTEND_RETIRED.DSB_MISS                      | Retired instructions which experienced DSB miss. Specify MSR_PEBS_FRONTEND.EVTSEL=11H.   | PS  |
| C6H        | 01H         | FRONTEND_RETIRED.L1I_MISS                      | Retired instructions which experienced instruction L1 cache true miss. Specify MSR_PEBS_FRONTEND.EVTSEL=12H.   | PS  |
| C6H        | 01H         | FRONTEND_RETIRED.L2_MISS                       | Retired instructions which experienced L2 cache true miss. Specify MSR_PEBS_FRONTEND.EVTSEL=13H.   | PS  |
| C6H        | 01H         | FRONTEND_RETIRED.ITLB_MISS                     | Retired instructions which experienced ITLB true miss. Specify MSR_PEBS_FRONTEND.EVTSEL=14H.   | PS  |
| C6H        | 01H         | FRONTEND_RETIRED.STLB_MIS<br>S                 | Retired instructions which experienced STLB true miss. Specify MSR_PEBS_FRONTEND.EVTSEL=15H.   | PS  |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_<br>GE_16             | Retired instructions that are fetched after an interval where the front end delivered no uops for at least 16 cycles. Specify the following fields in MSR_PEBS_FRONTEND: EVTSEL=16H, IDQ_Bubble_Length =16, IDQ_Bubble_Width = 4.                  | PS  |
| C6H        | 01H         | FRONTEND_RETIRED.LATENCY_<br>GE_2_BUBBLES_GE_m | Retired instructions that are fetched after an interval where the front end had 'm' IDQ slots delivered, no uops for at least 2 cycles. Specify the following fields in MSR_PEBS_FRONTEND: EVTSEL=16H, IDQ_Bubble_Length =2, IDQ_Bubble_Width = m. | PS, m = 1, 2, 3                               |
| C7H        | 01H         | FP_ARITH_INST_RETIRED.SCAL<br>AR_DOUBLE        | Number of double-precision, floating-point, scalar SSE/AVX computational instructions that are retired. Each scalar FMA instruction counts as 2.   | Software may treat each count as one DP FLOP. |
| C7H        | 02H         | FP_ARITH_INST_RETIRED.SCAL<br>AR_SINGLE        | Number of single-precision, floating-point, scalar SSE/AVX computational instructions that are retired. Each scalar FMA instruction counts as 2.   | Software may treat each count as one SP FLOP. |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                      | Description  | Comment  |
|------------|-------------|--|--|--|
| C7H        | 04H         | FP_ARITH_INST_RETIRED.128B_PACKED_DOUBLE | Number of double-precision, floating-point, 128-bit SSE/AVX computational instructions that are retired. Each 128-bit FMA or (V)DPPD instruction counts as 2.  | Software may treat each count as two DP FLOPs.   |
| C7H        | 08H         | FP_ARITH_INST_RETIRED.128B_PACKED_SINGLE | Number of single-precision, floating-point, 128-bit SSE/AVX computational instructions that are retired. Each 128-bit FMA or (V)DPPS instruction counts as 2.  | Software may treat each count as four SP FLOPs.  |
| C7H        | 10H         | FP_ARITH_INST_RETIRED.256B_PACKED_DOUBLE | Number of double-precision, floating-point, 256-bit SSE/AVX computational instructions that are retired. Each 256-bit FMA instruction counts as 2.   | Software may treat each count as four DP FLOPs.  |
| C7H        | 20H         | FP_ARITH_INST_RETIRED.256B_PACKED_SINGLE | Number of single-precision, floating-point, 256-bit SSE/AVX computational instructions that are retired. Each 256-bit FMA or VDPPS instruction counts as 2.  | Software may treat each count as eight SP FLOPs. |
| CAH        | 1EH         | FP_ASSIST.ANY                            | Cycles with any input/output SSE* or FP assists.   | CMSK1  |
| CBH        | 01H         | HW_INTERRUPTS.RECEIVED                   | Number of hardware interrupts received by the processor.   |  |
| CCH        | 20H         | ROB_MISC_EVENTS.LBR_INSERTS              | Increments when an entry is added to the Last Branch Record (LBR) array (or removed from the array in case of RETURNS in call stack mode). The event requires LBR enable via IA32_DEBUGCTL MSR and branch type selection via MSR_LBR_SELECT. |  |
| CDH        | 01H         | MEM_TRANS_RETIRED.LOAD_LATENCY           | Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization.  | Specify threshold in MSR 3F6H.<br>PSDLA          |
| DOH        | 11H         | MEM_INST_RETIRED.STLB_MISS_LOADS         | Retired load instructions that miss the STLB.  | PSDLA  |
| DOH        | 12H         | MEM_INST_RETIRED.STLB_MISS_STORES        | Retired store instructions that miss the STLB.   | PSDLA  |
| DOH        | 21H         | MEM_INST_RETIRED.LOCK_LOADS              | Retired load instructions with locked access.  | PSDLA  |
| DOH        | 41H         | MEM_INST_RETIRED.SPLIT_LOADS             | Number of load instructions retired with cache-line splits that may impact performance.  | PSDLA  |
| DOH        | 42H         | MEM_INST_RETIRED.SPLIT_STORES            | Number of store instructions retired with line-split.  | PSDLA  |
| DOH        | 81H         | MEM_INST_RETIRED.ALL_LOADS               | All retired load instructions.   | PSDLA  |
| DOH        | 82H         | MEM_INST_RETIRED.ALL_STORES              | All retired store instructions.  | PSDLA  |
| D1H        | 01H         | MEM_LOAD_RETIRED.L1_HIT                  | Retired load instructions with L1 cache hits as data sources.  | PSDLA  |
| D1H        | 02H         | MEM_LOAD_RETIRED.L2_HIT                  | Retired load instructions with L2 cache hits as data sources.  | PSDLA  |
| D1H        | 04H         | MEM_LOAD_RETIRED.L3_HIT                  | Retired load instructions with L3 cache hits as data sources.  | PSDLA  |
| D1H        | 08H         | MEM_LOAD_RETIRED.L1_MISS                 | Retired load instructions missed L1 cache as data sources.   | PSDLA  |
| D1H        | 10H         | MEM_LOAD_RETIRED.L2_MISS                 | Retired load instructions missed L2. Unknown data source excluded.   | PSDLA  |

**Table 19-4. Performance Events of the Processor Core Supported by Skylake Microarchitecture and Kaby Lake Microarchitecture (Contd.)**

| Event Num.  | Umask Value | Event Mask Mnemonic                | Description  | Comment |
|---|-------------|------------------------------------|--|---------|
| D1H   | 20H         | MEM_LOAD_RETIRED.L3_MISS           | Retired load instructions missed L3. Excludes unknown data source.   | PSDLA   |
| D1H   | 40H         | MEM_LOAD_RETIRED.FB_HIT            | Retired load instructions where data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready. | PSDLA   |
| D2H   | 01H         | MEM_LOAD_L3_HIT_RETIRED.X_SNP_MISS | Retired load instructions where data sources were L3 hit and cross-core snoop missed in on-pkg core cache.   | PSDLA   |
| D2H   | 02H         | MEM_LOAD_L3_HIT_RETIRED.X_SNP_HIT  | Retired load Instructions where data sources were L3 and cross-core snoop hits in on-pkg core cache.   | PSDLA   |
| D2H   | 04H         | MEM_LOAD_L3_HIT_RETIRED.X_SNP_HITM | Retired load instructions where data sources were HitM responses from shared L3.   | PSDLA   |
| D2H   | 08H         | MEM_LOAD_L3_HIT_RETIRED.X_SNP_NONE | Retired load instructions where data sources were hits in L3 without snoops required.  | PSDLA   |
| E6H   | 01H         | BACLEAR.S.ANY                      | Number of front end re-steers due to BPU misprediction.  |         |
| FOH   | 40H         | L2_TRANS.L2_WB                     | L2 writebacks that access L2 cache.  |         |
| F1H   | 07H         | L2_LINES_IN.ALL                    | L2 cache lines filling L2.   |         |
| CMSK1: Counter Mask = 1 required; CMSK4: CounterMask = 4 required; CMSK6: CounterMask = 6 required; CMSK8: CounterMask = 8 required; CMSK10: CounterMask = 10 required; CMSK12: CounterMask = 12 required; CMSK16: CounterMask = 16 required; CMSK20: CounterMask = 20 required.<br>AnyT: AnyThread = 1 required.<br>INV: Invert = 1 required.<br>EDG: EDGE = 1 required.<br>PSDLA: Also supports PEBS and DataLA.<br>PS: Also supports PEBS. |             |                                    |  |         |

Table 19-10 lists performance events supporting Intel TSX (see Section 18.3.6.5) and the events are applicable to processors based on Skylake microarchitecture. Where Skylake microarchitecture implements TSX-related event semantics that differ from Table 19-10, they are listed in Table 19-5.

**Table 19-5. Intel® TSX Performance Event Addendum in Processors based on Skylake Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic   | Description   | Comment |
|------------|-------------|-----------------------|---|---------|
| 54H        | 02H         | TX_MEM.ABORT_CAPACITY | Number of times a transactional abort was signaled due to a data capacity limitation for transactional reads or writes. |         |

## 19.4 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON PHI™ PROCESSOR 3200, 5200, 7200 SERIES

Intel® Xeon Phi™ processors 3200/5200/7200 series are based on the Knights Landing microarchitecture. Model-specific performance monitoring events in the processor core are listed in Table 19-6. The events in Table 19-6 apply to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following value 06\_57H.

**Table 19-6. Performance Events of the Processor Core Supported by Knights Landing Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic                | Description  | Comment      |
|------------|-------------|------------------------------------|--|--------------|
| 03H        | 01H         | RECYCLEQ.LD_BLOCK_ST_FORWARD       | Counts the number of occurrences a retired load gets blocked because its address partially overlaps with a store.                                  | PSDLA        |
| 03H        | 02H         | RECYCLEQ.LD_BLOCK_STD_NOT_READY    | Counts the number of occurrences a retired load gets blocked because its address overlaps with a store whose data is not ready.                    |              |
| 03H        | 04H         | RECYCLEQ.ST_SPLITS                 | Counts the number of occurrences a retired store that is a cache line split. Each split should be counted only once.                               |              |
| 03H        | 08H         | RECYCLEQ.LD_SPLITS                 | Counts the number of occurrences a retired load that is a cache line split. Each split should be counted only once.                                | PSDLA        |
| 03H        | 10H         | RECYCLEQ.LOCK                      | Counts all the retired locked loads. It does not include stores because we would double count if we count stores.                                  |              |
| 03H        | 20H         | RECYCLEQ.STA_FULL                  | Counts the store micro-ops retired that were pushed in the recycle queue because the store address buffer is full.                                 |              |
| 03H        | 40H         | RECYCLEQ.ANY_LD                    | Counts any retired load that was pushed into the recycle queue for any reason.   |              |
| 03H        | 80H         | RECYCLEQ.ANY_ST                    | Counts any retired store that was pushed into the recycle queue for any reason.  |              |
| 04H        | 01H         | MEM_UOPS_RETIRED.L1_MISS_LOADS     | Counts the number of load micro-ops retired that miss in L1 D cache.   |              |
| 04H        | 02H         | MEM_UOPS_RETIRED.L2_HIT_LOADS      | Counts the number of load micro-ops retired that hit in the L2.  | PSDLA        |
| 04H        | 04H         | MEM_UOPS_RETIRED.L2_MISS_LOADS     | Counts the number of load micro-ops retired that miss in the L2.   | PSDLA        |
| 04H        | 08H         | MEM_UOPS_RETIRED.DTLB_MISSES_LOADS | Counts the number of load micro-ops retired that cause a DTLB miss.  | PSDLA        |
| 04H        | 10H         | MEM_UOPS_RETIRED.UTLB_MISSES_LOADS | Counts the number of load micro-ops retired that caused micro TLB miss.  |              |
| 04H        | 20H         | MEM_UOPS_RETIRED.HITM              | Counts the loads retired that get the data from the other core in the same tile in M state.  |              |
| 04H        | 40H         | MEM_UOPS_RETIRED.ALL_LOADS         | Counts all the load micro-ops retired.   |              |
| 04H        | 80H         | MEM_UOPS_RETIRED.ALL_STORES        | Counts all the store micro-ops retired.  |              |
| 05H        | 01H         | PAGE_WALKS.D_SIDE_WALKS            | Counts the total D-side page walks that are completed or started. The page walks started in the speculative path will also be counted.             | EdgeDetect=1 |
| 05H        | 01H         | PAGE_WALKS.D_SIDE_CYCLES           | Counts the total number of core cycles for all the D-side page walks. The cycles for page walks started in speculative path will also be included. |              |
| 05H        | 02H         | PAGE_WALKS.I_SIDE_WALKS            | Counts the total I-side page walks that are completed.   | EdgeDetect=1 |

**Table 19-6. Performance Events of the Processor Core Supported by Knights Landing Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description   | Comment   |
|------------|-------------|--|---|---|
| 05H        | 02H         | PAGE_WALKS.I_SIDE_CYCLES               | Counts the total number of core cycles for all the I-side page walks. The cycles for page walks started in speculative path will also be included.  |   |
| 05H        | 03H         | PAGE_WALKS.WALKS                       | Counts the total page walks that are completed (I-side and D-side).   | EdgeDetect=1  |
| 05H        | 03H         | PAGE_WALKS.CYCLES                      | Counts the total number of core cycles for all the page walks. The cycles for page walks started in speculative path will also be included.   |   |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS                 | Counts the number of L2 cache misses. Also called L2_REQUESTS_MISS.   |   |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFERENCE            | Counts the total number of L2 cache references. Also called L2_REQUESTS_REFERENCE.  |   |
| 30H        | 00H         | L2_REQUESTS_REJECT.ALL                 | Counts the number of MEC requests from the L2Q that reference a cache line (cacheable requests) excluding SW prefetches filling only to L2 cache and L1 evictions (automatically excludes L2HWP, UC, WC) that were rejected - Multiple repeated rejects should be counted multiple times. |   |
| 31H        | 00H         | CORE_REJECT_L2Q.ALL                    | Counts the number of MEC requests that were not accepted into the L2Q because of any L2 queue reject condition. There is no concept of at-ret here. It might include requests due to instructions in the speculative path.  |   |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P              | Counts the number of unhalting core clock cycles.   |   |
| 3CH        | 01H         | CPU_CLK_UNHALTED.REF                   | Counts the number of unhalting reference clock cycles.  |   |
| 3EH        | 04H         | L2_PREFETCHER.ALLOC_XQ                 | Counts the number of L2HWP allocated into XQ GP.  |   |
| 80H        | 01H         | ICACHE.HIT                             | Counts all instruction fetches that hit the instruction cache.  |   |
| 80H        | 02H         | ICACHE.MISSES                          | Counts all instruction fetches that miss the instruction cache or produce memory requests. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.   |   |
| 80H        | 03H         | ICACHE.ACCESSSES                       | Counts all instruction fetches, including uncacheable fetches.  |   |
| 86H        | 04H         | FETCH_STALL.ICACHE_FILL_PENDING_CYCLES | Counts the number of core cycles the fetch stalls because of an icache miss. This is a cumulative count of core cycles the fetch stalled for all icache misses.   |   |
| B7H        | 01H         | OFFCORE_RESPONSE_0                     | See Section 18.4.1.1.2.   | Requires MSR_OFFCORE_RESP 0 to specify request type and response. |
| B7H        | 02H         | OFFCORE_RESPONSE_1                     | See Section 18.4.1.1.2.   | Requires MSR_OFFCORE_RESP 1 to specify request type and response. |
| C0H        | 00H         | INST_RETIRED.ANY_P                     | Counts the total number of instructions retired.  | PS  |

**Table 19-6. Performance Events of the Processor Core Supported by Knights Landing Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description  | Comment |
|------------|-------------|--------------------------------|--|---------|
| C2H        | 01H         | UOPS_RETIRED.MS                | Counts the number of micro-ops retired that are from the complex flows issued by the micro-sequencer (MS).   |         |
| C2H        | 10H         | UOPS_RETIRED.ALL               | Counts the number of micro-ops retired.  |         |
| C2H        | 20H         | UOPS_RETIRED.SCALAR_SIMD       | Counts the number of scalar SSE, AVX, AVX2, and AVX-512 micro-ops except for loads (memory-to-register mov-type micro ops), division and sqrt.   |         |
| C2H        | 40H         | UOPS_RETIRED.PACKED_SIMD       | Counts the number of packed SSE, AVX, AVX2, and AVX-512 micro-ops (both floating point and integer) except for loads (memory-to-register mov-type micro-ops), packed byte and word multiplies. |         |
| C3H        | 01H         | MACHINE_CLEARS.SMC             | Counts the number of times that the machine clears due to program modifying data within 1K of a recently fetched code page.  |         |
| C3H        | 02H         | MACHINE_CLEARS.MEMORY_ORDERING | Counts the number of times the machine clears due to memory ordering hazards.  |         |
| C3H        | 04H         | MACHINE_CLEARS.FP_ASSIST       | Counts the number of floating operations retired that required microcode assists.  |         |
| C3H        | 08H         | MACHINE_CLEARS.ALL             | Counts all machine clears.   |         |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES   | Counts the number of branch instructions retired.  | PS      |
| C4H        | 7EH         | BR_INST_RETIRED.JCC            | Counts the number of JCC branch instructions retired.  | PS      |
| C4H        | BFH         | BR_INST_RETIRED.FAR_BRANCH     | Counts the number of far branch instructions retired.  | PS      |
| C4H        | EBH         | BR_INST_RETIRED.NON_RETURN_IND | Counts the number of branch instructions retired that were near indirect CALL or near indirect JMP.  | PS      |
| C4H        | F7H         | BR_INST_RETIRED.RETURN         | Counts the number of near RET branch instructions retired.   | PS      |
| C4H        | F9H         | BR_INST_RETIRED.CALL           | Counts the number of near CALL branch instructions retired.  | PS      |
| C4H        | FBH         | BR_INST_RETIRED.IND_CALL       | Counts the number of near indirect CALL branch instructions retired.   | PS      |
| C4H        | FDH         | BR_INST_RETIRED.REL_CALL       | Counts the number of near relative CALL branch instructions retired.   | PS      |
| C4H        | FEH         | BR_INST_RETIRED.TAKEN_JCC      | Counts the number of branch instructions retired that were taken conditional jumps.  | PS      |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANCHES   | Counts the number of mispredicted branch instructions retired.   | PS      |
| C5H        | 7EH         | BR_MISP_RETIRED.JCC            | Counts the number of mispredicted JCC branch instructions retired.   | PS      |
| C5H        | BFH         | BR_MISP_RETIRED.FAR_BRANCH     | Counts the number of mispredicted far branch instructions retired.   | PS      |
| C5H        | EBH         | BR_MISP_RETIRED.NON_RETURN_IND | Counts the number of mispredicted branch instructions retired that were near indirect CALL or near indirect JMP.   | PS      |
| C5H        | F7H         | BR_MISP_RETIRED.RETURN         | Counts the number of mispredicted near RET branch instructions retired.  | PS      |

**Table 19-6. Performance Events of the Processor Core Supported by Knights Landing Microarchitecture**

| Event Num.   | Umask Value | Event Mask Mnemonic           | Description   | Comment |
|--|-------------|-------------------------------|---|---------|
| C5H  | F9H         | BR_MISP_RETIRED.CALL          | Counts the number of mispredicted near CALL branch instructions retired.  | PS      |
| C5H  | FBH         | BR_MISP_RETIRED.IND_CALL      | Counts the number of mispredicted near indirect CALL branch instructions retired.   | PS      |
| C5H  | FDH         | BR_MISP_RETIRED.REL_CALL      | Counts the number of mispredicted near relative CALL branch instructions retired.   | PS      |
| C5H  | FEH         | BR_MISP_RETIRED.TAKEN_JCC     | Counts the number of mispredicted branch instructions retired that were taken conditional jumps.  | PS      |
| CAH  | 01H         | NO_ALLOC_CYCLES.ROB_FULL      | Counts the number of core cycles when no micro-ops are allocated and the ROB is full.   |         |
| CAH  | 04H         | NO_ALLOC_CYCLES.MISPREDICT S  | Counts the number of core cycles when no micro-ops are allocated and the alloc pipe is stalled waiting for a mispredicted branch to retire.   |         |
| CAH  | 20H         | NO_ALLOC_CYCLES.RAT_STALL     | Counts the number of core cycles when no micro-ops are allocated and a RATstall (caused by reservation station full) is asserted.             |         |
| CAH  | 90H         | NO_ALLOC_CYCLES.NOT_DELIVERED | Counts the number of core cycles when no micro-ops are allocated, the IQ is empty, and no other condition is blocking allocation.             |         |
| CAH  | 7FH         | NO_ALLOC_CYCLES.ALL           | Counts the total number of core cycles when no micro-ops are allocated for any reason.  |         |
| CBH  | 01H         | RS_FULL_STALL.MEC             | Counts the number of core cycles when allocation pipeline is stalled and is waiting for a free MEC reservation station entry.                 |         |
| CBH  | 1FH         | RS_FULL_STALL.ALL             | Counts the total number of core cycles the allocation pipeline is stalled when any one of the reservation stations is full.                   |         |
| CDH  | 01H         | CYCLES_DIV_BUSY.ALL           | Cycles the number of core cycles when divider is busy. Does not imply a stall waiting for the divider.  |         |
| E6H  | 01H         | BACLEAR.S.ALL                 | Counts the number of times the front end resteers for any branch as a result of another branch handling mechanism in the front end.           |         |
| E6H  | 08H         | BACLEAR.S.RETURN              | Counts the number of times the front end resteers for RET branches as a result of another branch handling mechanism in the front end.         |         |
| E6H  | 10H         | BACLEAR.S.COND                | Counts the number of times the front end resteers for conditional branches as a result of another branch handling mechanism in the front end. |         |
| E7H  | 01H         | MS_DECODED.MS_ENTRY           | Counts the number of times the MSROM starts a flow of uops.   |         |
| PS: Also supports PEBS.<br>PSDLA: Also supports PEBS and DataLA. |             |                               |   |         |

## 19.5 PERFORMANCE MONITORING EVENTS FOR THE INTEL® CORE™ M AND 5TH GENERATION INTEL® CORE™ PROCESSORS

The Intel® Core™ M processors, the 5th generation Intel® Core™ processors and the Intel Xeon processor E3 1200 v4 product family are based on the Broadwell microarchitecture. They support the architectural performance monitoring events listed in Table 19-1. Model-specific performance monitoring events in the processor core are listed in Table 19-7. The events in Table 19-7 apply to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following values: 06\_3DH and 06\_47H. Table 19-10 lists performance events supporting Intel TSX (see Section 18.3.6.5) and the events are available on processors based on Broadwell microarchitecture. Fixed counters in the core PMU support the architecture events defined in Table 19-2.

Model-specific performance monitoring events that are located in the uncore sub-system are implementation specific between different platforms using processors based on Broadwell microarchitecture and with different DisplayFamily\_DisplayModel signatures. Processors with CPUID signature of DisplayFamily\_DisplayModel 06\_3DH and 06\_47H support uncore performance events listed in Table 19-11.

**Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic                 | Description   | Comment   |
|------------|-------------|-------------------------------------|---|---|
| 03H        | 02H         | LD_BLOCKS.STORE_FORWARD             | Loads blocked by overlapping with store buffer that cannot be forwarded.  |   |
| 03H        | 08H         | LD_BLOCKS.NO_SR                     | The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.                                  |   |
| 05H        | 01H         | MISALIGN_MEM_REF.LOADS              | Speculative cache-line split load uops dispatched to L1D.   |   |
| 05H        | 02H         | MISALIGN_MEM_REF.STORES             | Speculative cache-line split store-address uops dispatched to L1D.  |   |
| 07H        | 01H         | LD_BLOCKS_PARTIAL.ADDRESS_ALIAS     | False dependencies in MOB due to partial compare on address.  |   |
| 08H        | 01H         | DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK | Load misses in all TLB levels that cause a page walk of any page size.  |   |
| 08H        | 02H         | DTLB_LOAD_MISSES.WALK_COMPLETED_4K  | Completed page walks due to demand load misses that caused 4K page walks in any TLB levels.   |   |
| 08H        | 10H         | DTLB_LOAD_MISSES.WALK_DURATION      | Cycle PMH is busy with a walk.  |   |
| 08H        | 20H         | DTLB_LOAD_MISSES.STLB_HIT_4K        | Load misses that missed DTLB but hit STLB (4K).   |   |
| 0DH        | 03H         | INT_MISC.RECOVERY_CYCLES            | Cycles waiting to recover after Machine Clears except JEClear. Set Cmask = 1.   | Set Edge to count occurrences.                  |
| 0EH        | 01H         | UOPS_ISSUED.ANY                     | Increments each cycle the # of uops issued by the RAT to RS. Set Cmask = 1, Inv = 1, Any = 1 to count stalled cycles of this core.  | Set Cmask = 1, Inv = 1 to count stalled cycles. |
| 0EH        | 10H         | UOPS_ISSUED.FLAGS_MERGE             | Number of flags-merge uops allocated. Such uops add delay.  |   |
| 0EH        | 20H         | UOPS_ISSUED.SLOW_LEA                | Number of slow LEA or similar uops allocated. Such uop has 3 sources (for example, 2 sources + immediate) regardless of whether it is a result of LEA instruction or not. |   |
| 0EH        | 40H         | UOPS_ISSUED.SINGLE_MUL              | Number of multiply packed/scalar single precision uops allocated.   |   |

**Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                  | Description  | Comment   |
|------------|-------------|--------------------------------------|--|---|
| 14H        | 01H         | ARITH.FPU_DIV_ACTIVE                 | Cycles when divider is busy executing divide operations.   |   |
| 24H        | 21H         | L2_RQSTS.DEMAND_DATA_RD_MISS         | Demand data read requests that missed L2, no rejects.  |   |
| 24H        | 41H         | L2_RQSTS.DEMAND_DATA_RD_HIT          | Demand data read requests that hit L2 cache.   |   |
| 24H        | 50H         | L2_RQSTS.L2_PF_HIT                   | Counts all L2 HW prefetcher requests that hit L2.  |   |
| 24H        | 30H         | L2_RQSTS.L2_PF_MISS                  | Counts all L2 HW prefetcher requests that missed L2.   |   |
| 24H        | E1H         | L2_RQSTS.ALL_DEMAND_DATA_RD          | Counts any demand and L1 HW prefetch data load requests to L2.   |   |
| 24H        | E2H         | L2_RQSTS.ALL_RFO                     | Counts all L2 store RFO requests.  |   |
| 24H        | E4H         | L2_RQSTS.ALL_CODE_RD                 | Counts all L2 code requests.   |   |
| 24H        | F8H         | L2_RQSTS.ALL_PF                      | Counts all L2 HW prefetcher requests.  |   |
| 27H        | 50H         | L2_DEMAND_RQSTS.WB_HIT               | Not rejected writebacks that hit L2 cache.   |   |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFERENCE          | This event counts requests originating from the core that reference a cache line in the last level cache.  | See Table 19-1.                                   |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS               | This event counts each cache miss condition for references to the last level cache.  | See Table 19-1.                                   |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P            | Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling. | See Table 19-1.                                   |
| 3CH        | 01H         | CPU_CLK_THREAD_UNHALTED.REF_XCLK     | Increments at the frequency of XCLK (100 MHz) when not halted.   | See Table 19-1.                                   |
| 48H        | 01H         | L1D_PEND_MISS.PENDING                | Increments the number of outstanding L1D misses every cycle. Set Cmask = 1 and Edge = 1 to count occurrences.  | Counter 2 only.<br>Set Cmask = 1 to count cycles. |
| 49H        | 01H         | DTLB_STORE_MISSES.MISS_CAUSES_A_WALK | Miss in all TLB levels causes a page walk of any page size (4K/2M/4M/1G).  |   |
| 49H        | 02H         | DTLB_STORE_MISSES.WALK_COMPLETED_4K  | Completed page walks due to store misses in one or more TLB levels of 4K page structure.   |   |
| 49H        | 10H         | DTLB_STORE_MISSES.WALK_DURATION      | Cycles PMH is busy with this walk.   |   |
| 49H        | 20H         | DTLB_STORE_MISSES.STLB_HIT_4K        | Store misses that missed DTLB but hit STLB (4K).   |   |
| 4CH        | 02H         | LOAD_HIT_PRE.HW_PF                   | Non-SW-prefetch load dispatches that hit fill buffer allocated for H/W prefetch.   |   |
| 4FH        | 10H         | EPT.WALK_CYCLES                      | Cycles of Extended Page Table walks.   |   |
| 51H        | 01H         | L1D.REPLACEMENT                      | Counts the number of lines brought into the L1 data cache.   |   |
| 58H        | 04H         | MOVE_ELIMINATION.INT_NOT_ELIMINATED  | Number of integer move elimination candidate uops that were not eliminated.  |   |

**Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                         | Description  | Comment                        |
|------------|-------------|---|--|--------------------------------|
| 58H        | 08H         | MOVE_ELIMINATION.SIMD_NOT_ELIMINATED        | Number of SIMD move elimination candidate uops that were not eliminated.   |                                |
| 58H        | 01H         | MOVE_ELIMINATION.INT_ELIMINATED             | Number of integer move elimination candidate uops that were eliminated.  |                                |
| 58H        | 02H         | MOVE_ELIMINATION.SIMD_ELIMINATED            | Number of SIMD move elimination candidate uops that were eliminated.   |                                |
| 5CH        | 01H         | CPL_CYCLES.RING0                            | Unhalted core cycles when the thread is in ring 0.   | Use Edge to count transition.  |
| 5CH        | 02H         | CPL_CYCLES.RING123                          | Unhalted core cycles when the thread is not in ring 0.   |                                |
| 5EH        | 01H         | RS_EVENTS.EMPTY_CYCLES                      | Cycles the RS is empty for the thread.   |                                |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD | Offcore outstanding demand data read transactions in SQ to uncore. Set Cmask=1 to count cycles.  | Use only when HTT is off.      |
| 60H        | 02H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_CODE_RD | Offcore outstanding demand code read transactions in SQ to uncore. Set Cmask=1 to count cycles.  | Use only when HTT is off.      |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO     | Offcore outstanding RFO store transactions in SQ to uncore. Set Cmask=1 to count cycles.   | Use only when HTT is off.      |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD    | Offcore outstanding cacheable data read transactions in SQ to uncore. Set Cmask=1 to count cycles.                                     | Use only when HTT is off.      |
| 63H        | 01H         | LOCK_CYCLES.SPLIT_LOCK_UC_LOCK_DURATION     | Cycles in which the L1D and L2 are locked, due to a UC lock or split lock.   |                                |
| 63H        | 02H         | LOCK_CYCLES.CACHE_LOCK_DURATION             | Cycles in which the L1D is locked.   |                                |
| 79H        | 02H         | IDQ.EMPTY                                   | Counts cycles the IDQ is empty.  |                                |
| 79H        | 04H         | IDQ.MITE_UOPS                               | Increment each cycle # of uops delivered to IDQ from MITE path. Set Cmask = 1 to count cycles.   | Can combine Umask 04H and 20H. |
| 79H        | 08H         | IDQ.DSB_UOPS                                | Increment each cycle # of uops delivered to IDQ from DSB path. Set Cmask = 1 to count cycles.  | Can combine Umask 08H and 10H. |
| 79H        | 10H         | IDQ.MS_DSB_UOPS                             | Increment each cycle # of uops delivered to IDQ when MS_busy by DSB. Set Cmask = 1 to count cycles. Add Edge=1 to count # of delivery. | Can combine Umask 04H, 08H.    |
| 79H        | 20H         | IDQ.MS_MITE_UOPS                            | Increment each cycle # of uops delivered to IDQ when MS_busy by MITE. Set Cmask = 1 to count cycles.                                   | Can combine Umask 04H, 08H.    |
| 79H        | 30H         | IDQ.MS_UOPS                                 | Increment each cycle # of uops delivered to IDQ from MS by either DSB or MITE. Set Cmask = 1 to count cycles.                          | Can combine Umask 04H, 08H.    |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_ANY_UOPS                 | Counts cycles DSB is delivered at least one uops. Set Cmask = 1.   |                                |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_4_UOPS                   | Counts cycles DSB is delivered four uops. Set Cmask = 4.   |                                |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_ANY_UOPS                | Counts cycles MITE is delivered at least one uop. Set Cmask = 1.   |                                |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_4_UOPS                  | Counts cycles MITE is delivered four uops. Set Cmask = 4.  |                                |
| 79H        | 3CH         | IDQ.MITE_ALL_UOPS                           | Number of uops delivered to IDQ from any path.   |                                |

**Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description  | Comment                           |
|------------|-------------|--|--|-----------------------------------|
| 80H        | 02H         | ICACHE.MISSES                          | Number of Instruction Cache, Streaming Buffer and Victim Cache Misses. Includes UC accesses.           |                                   |
| 85H        | 01H         | ITLB_MISSES.MISS_CAUSES_A_WALK         | Misses in ITLB that cause a page walk of any page size.  |                                   |
| 85H        | 02H         | ITLB_MISSES.WALK_COMPLETE_D_4K         | Completed page walks due to misses in ITLB 4K page entries.  |                                   |
| 85H        | 10H         | ITLB_MISSES.WALK_DURATION              | Cycle PMH is busy with a walk.   |                                   |
| 85H        | 20H         | ITLB_MISSES.STLB_HIT_4K                | ITLB misses that hit STLB (4K).  |                                   |
| 87H        | 01H         | ILD_STALL.LCP                          | Stalls caused by changing prefix length of the instruction.  |                                   |
| 88H        | 01H         | BR_INST_EXEC.COND                      | Qualify conditional near branch instructions executed, but not necessarily retired.                    | Must combine with umask 40H, 80H. |
| 88H        | 02H         | BR_INST_EXEC.DIRECT_JMP                | Qualify all unconditional near branch instructions excluding calls and indirect branches.              | Must combine with umask 80H.      |
| 88H        | 04H         | BR_INST_EXEC.INDIRECT_JMP_NON_CALL_RET | Qualify executed indirect near branch instructions that are not calls or returns.                      | Must combine with umask 80H.      |
| 88H        | 08H         | BR_INST_EXEC.RETURN_NEAR               | Qualify indirect near branches that have a return mnemonic.  | Must combine with umask 80H.      |
| 88H        | 10H         | BR_INST_EXEC.DIRECT_NEAR_CALL          | Qualify unconditional near call branch instructions, excluding non-call branch, executed.              | Must combine with umask 80H.      |
| 88H        | 20H         | BR_INST_EXEC.INDIRECT_NEAR_CALL        | Qualify indirect near calls, including both register and memory indirect, executed.                    | Must combine with umask 80H.      |
| 88H        | 40H         | BR_INST_EXEC.NONTAKEN                  | Qualify non-taken near branches executed.  | Applicable to umask 01H only.     |
| 88H        | 80H         | BR_INST_EXEC.TAKEN                     | Qualify taken near branches executed. Must combine with 01H,02H, 04H, 08H, 10H, 20H.                   |                                   |
| 88H        | FFH         | BR_INST_EXEC.ALL_BRANCHES              | Counts all near executed branches (not necessarily retired).   |                                   |
| 89H        | 01H         | BR_MISP_EXEC.COND                      | Qualify conditional near branch instructions mispredicted.   | Must combine with umask 40H, 80H. |
| 89H        | 04H         | BR_MISP_EXEC.INDIRECT_JMP_NON_CALL_RET | Qualify mispredicted indirect near branch instructions that are not calls or returns.                  | Must combine with umask 80H.      |
| 89H        | 08H         | BR_MISP_EXEC.RETURN_NEAR               | Qualify mispredicted indirect near branches that have a return mnemonic.                               | Must combine with umask 80H.      |
| 89H        | 10H         | BR_MISP_EXEC.DIRECT_NEAR_CALL          | Qualify mispredicted unconditional near call branch instructions, excluding non-call branch, executed. | Must combine with umask 80H.      |
| 89H        | 20H         | BR_MISP_EXEC.INDIRECT_NEAR_CALL        | Qualify mispredicted indirect near calls, including both register and memory indirect, executed.       | Must combine with umask 80H.      |
| 89H        | 40H         | BR_MISP_EXEC.NONTAKEN                  | Qualify mispredicted non-taken near branches executed.   | Applicable to umask 01H only.     |
| 89H        | 80H         | BR_MISP_EXEC.TAKEN                     | Qualify mispredicted taken near branches executed. Must combine with 01H,02H, 04H, 08H, 10H, 20H.      |                                   |
| 89H        | FFH         | BR_MISP_EXEC.ALL_BRANCHES              | Counts all near executed branches (not necessarily retired).   |                                   |

**Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                  | Description   | Comment                          |
|------------|-------------|--------------------------------------|---|----------------------------------|
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CO<br>RE      | Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back end stall. | Use Cmask to qualify uop b/w.    |
| A1H        | 01H         | UOPS_DISPATCHED_PORT.PORT<br>_0      | Counts the number of cycles in which a uop is dispatched to port 0.   | Set AnyThread to count per core. |
| A1H        | 02H         | UOPS_DISPATCHED_PORT.PORT<br>_1      | Counts the number of cycles in which a uop is dispatched to port 1.   | Set AnyThread to count per core. |
| A1H        | 04H         | UOPS_DISPATCHED_PORT.PORT<br>_2      | Counts the number of cycles in which a uop is dispatched to port 2.   | Set AnyThread to count per core. |
| A1H        | 08H         | UOPS_DISPATCHED_PORT.PORT<br>_3      | Counts the number of cycles in which a uop is dispatched to port 3.   | Set AnyThread to count per core. |
| A1H        | 10H         | UOPS_DISPATCHED_PORT.PORT<br>_4      | Counts the number of cycles in which a uop is dispatched to port 4.   | Set AnyThread to count per core. |
| A1H        | 20H         | UOPS_DISPATCHED_PORT.PORT<br>_5      | Counts the number of cycles in which a uop is dispatched to port 5.   | Set AnyThread to count per core. |
| A1H        | 40H         | UOPS_DISPATCHED_PORT.PORT<br>_6      | Counts the number of cycles in which a uop is dispatched to port 6.   | Set AnyThread to count per core. |
| A1H        | 80H         | UOPS_DISPATCHED_PORT.PORT<br>_7      | Counts the number of cycles in which a uop is dispatched to port 7.   | Set AnyThread to count per core. |
| A2H        | 01H         | RESOURCE_STALLS.ANY                  | Cycles Allocation is stalled due to resource related reason.  |                                  |
| A2H        | 04H         | RESOURCE_STALLS.RS                   | Cycles stalled due to no eligible RS entry available.   |                                  |
| A2H        | 08H         | RESOURCE_STALLS.SB                   | Cycles stalled due to no store buffers available (not including draining from sync).                                      |                                  |
| A2H        | 10H         | RESOURCE_STALLS.ROB                  | Cycles stalled due to re-order buffer full.   |                                  |
| A8H        | 01H         | LSD.UOPS                             | Number of uops delivered by the LSD.  |                                  |
| ABH        | 02H         | DSB2MITE_SWITCHES.PENALTY<br>_CYCLES | Cycles of delay due to Decode Stream Buffer to MITE switches.   |                                  |
| AEH        | 01H         | ITLB.ITLB_FLUSH                      | Counts the number of ITLB flushes; includes 4k/2M/4M pages.   |                                  |
| B0H        | 01H         | OFFCORE_REQUESTS.DEMAND_<br>DATA_RD  | Demand data read requests sent to uncore.   | Use only when HTT is off.        |
| B0H        | 02H         | OFFCORE_REQUESTS.DEMAND_<br>CODE_RD  | Demand code read requests sent to uncore.   | Use only when HTT is off.        |
| B0H        | 04H         | OFFCORE_REQUESTS.DEMAND_<br>RFO      | Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.   | Use only when HTT is off.        |
| B0H        | 08H         | OFFCORE_REQUESTS.ALL_DATA<br>_RD     | Data read requests sent to uncore (demand and prefetch).  | Use only when HTT is off.        |
| B1H        | 01H         | UOPS_EXECUTED.THREAD                 | Counts total number of uops to be executed per-logical-processor each cycle.  | Use Cmask to count stall cycles. |
| B1H        | 02H         | UOPS_EXECUTED.CORE                   | Counts total number of uops to be executed per-core each cycle.   | Do not need to set ANY.          |
| B7H        | 01H         | OFF_CORE_RESPONSE_0                  | See Section 18.3.4.5, "Off-core Response Performance Monitoring".   | Requires MSR 01A6H.              |

**Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description  | Comment  |
|------------|-------------|--------------------------------|--|--|
| BBH        | 01H         | OFF_CORE_RESPONSE_1            | See Section 18.3.4.5, "Off-core Response Performance Monitoring".  | Requires MSR 01A7H.                                    |
| BCH        | 11H         | PAGE_WALKER_LOADS.DTLB_L1      | Number of DTLB page walker loads that hit in the L1+FB.  |  |
| BCH        | 21H         | PAGE_WALKER_LOADS.ITLB_L1      | Number of ITLB page walker loads that hit in the L1+FB.  |  |
| BCH        | 12H         | PAGE_WALKER_LOADS.DTLB_L2      | Number of DTLB page walker loads that hit in the L2.   |  |
| BCH        | 22H         | PAGE_WALKER_LOADS.ITLB_L2      | Number of ITLB page walker loads that hit in the L2.   |  |
| BCH        | 14H         | PAGE_WALKER_LOADS.DTLB_L3      | Number of DTLB page walker loads that hit in the L3.   |  |
| BCH        | 24H         | PAGE_WALKER_LOADS.ITLB_L3      | Number of ITLB page walker loads that hit in the L3.   |  |
| BCH        | 18H         | PAGE_WALKER_LOADS.DTLB_MEMORY  | Number of DTLB page walker loads from memory.  |  |
| COH        | 00H         | INST_RETIRED.ANY_P             | Number of instructions at retirement.  | See Table 19-1.  |
| COH        | 01H         | INST_RETIRED.PREC_DIST         | Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.                                | PMC1 only.   |
| COH        | 02H         | INST_RETIRED.X87               | FP operations retired. X87 FP operations that have no exceptions.  |  |
| C1H        | 08H         | OTHER_ASSISTS.AVX_TO_SSE       | Number of transitions from AVX-256 to legacy SSE when penalty applicable.  |  |
| C1H        | 10H         | OTHER_ASSISTS.SSE_TO_AVX       | Number of transitions from SSE to AVX-256 when penalty applicable.   |  |
| C1H        | 40H         | OTHER_ASSISTS.ANY_WB_ASSIST    | Number of microcode assists invoked by HW upon uop writeback.  |  |
| C2H        | 01H         | UOPS_RETIRED.ALL               | Counts the number of micro-ops retired.<br>Use cmask=1 and invert to count active cycles or stalled cycles.                  | Supports PEBS and DataLA, use Any=1 for core granular. |
| C2H        | 02H         | UOPS_RETIRED.RETIRE_SLOTS      | Counts the number of retirement slots used each cycle.   | Supports PEBS.   |
| C3H        | 01H         | MACHINE_CLEARS.CYCLES          | Counts cycles while a machine clears stalled forward progress of a logical processor or a processor core.                    |  |
| C3H        | 02H         | MACHINE_CLEARS.MEMORY_ORDERING | Counts the number of machine clears due to memory order conflicts.   |  |
| C3H        | 04H         | MACHINE_CLEARS.SMC             | Number of self-modifying-code machine clears detected.   |  |
| C3H        | 20H         | MACHINE_CLEARS.MASKMOV         | Counts the number of executed AVX masked load operations that refer to an illegal address range with the mask bits set to 0. |  |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES   | Branch instructions at retirement.   | See Table 19-1.  |
| C4H        | 01H         | BR_INST_RETIRED.CONDITIONAL    | Counts the number of conditional branch instructions retired.  | Supports PEBS.   |
| C4H        | 02H         | BR_INST_RETIRED.NEAR_CALL      | Direct and indirect near call instructions retired.  | Supports PEBS.   |
| C4H        | 04H         | BR_INST_RETIRED.ALL_BRANCHES   | Counts the number of branch instructions retired.  | Supports PEBS.   |

**Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                 | Description   | Comment                        |
|------------|-------------|-------------------------------------|---|--------------------------------|
| C4H        | 08H         | BR_INST_RETIRED.NEAR_RETURN         | Counts the number of near return instructions retired.  | Supports PEBS.                 |
| C4H        | 10H         | BR_INST_RETIRED.NOT_TAKEN           | Counts the number of not taken branch instructions retired.   |                                |
| C4H        | 20H         | BR_INST_RETIRED.NEAR_TAKEN          | Number of near taken branches retired.  | Supports PEBS.                 |
| C4H        | 40H         | BR_INST_RETIRED.FAR_BRANCH          | Number of far branches retired.   |                                |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANCHES        | Mispredicted branch instructions at retirement.   | See Table 19-1.                |
| C5H        | 01H         | BR_MISP_RETIRED.CONDITIONAL         | Mispredicted conditional branch instructions retired.   | Supports PEBS.                 |
| C5H        | 04H         | BR_MISP_RETIRED.ALL_BRANCHES        | Mispredicted macro branch instructions retired.   | Supports PEBS.                 |
| CAH        | 02H         | FP_ASSIST.X87_OUTPUT                | Number of X87 FP assists due to output values.  |                                |
| CAH        | 04H         | FP_ASSIST.X87_INPUT                 | Number of X87 FP assists due to input values.   |                                |
| CAH        | 08H         | FP_ASSIST.SIMD_OUTPUT               | Number of SIMD FP assists due to output values.   |                                |
| CAH        | 10H         | FP_ASSIST.SIMD_INPUT                | Number of SIMD FP assists due to input values.  |                                |
| CAH        | 1EH         | FP_ASSIST.ANY                       | Cycles with any input/output SSE* or FP assists.  |                                |
| CCH        | 20H         | ROB_MISC_EVENTS.LBR_INSERTS         | Count cases of saving new LBR records by hardware.  |                                |
| CDH        | 01H         | MEM_TRANS_RETIRED.LOAD_LATENCY      | Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization. | Specify threshold in MSR 3F6H. |
| D0H        | 11H         | MEM_UOPS_RETIRED.STLB_MISSES_LOADS  | Retired load uops that miss the STLB.   | Supports PEBS and DataLA.      |
| D0H        | 12H         | MEM_UOPS_RETIRED.STLB_MISSES_STORES | Retired store uops that miss the STLB.  | Supports PEBS and DataLA.      |
| D0H        | 21H         | MEM_UOPS_RETIRED.LOCK_LOADS         | Retired load uops with locked access.   | Supports PEBS and DataLA.      |
| D0H        | 41H         | MEM_UOPS_RETIRED.SPLIT_LOADS        | Retired load uops that split across a cacheline boundary.   | Supports PEBS and DataLA.      |
| D0H        | 42H         | MEM_UOPS_RETIRED.SPLIT_STORES       | Retired store uops that split across a cacheline boundary.  | Supports PEBS and DataLA.      |
| D0H        | 81H         | MEM_UOPS_RETIRED.ALL_LOADS          | All retired load uops.  | Supports PEBS and DataLA.      |
| D0H        | 82H         | MEM_UOPS_RETIRED.ALL_STORES         | All retired store uops.   | Supports PEBS and DataLA.      |
| D1H        | 01H         | MEM_LOAD_UOPS_RETIRED.L1_HIT        | Retired load uops with L1 cache hits as data sources.   | Supports PEBS and DataLA.      |
| D1H        | 02H         | MEM_LOAD_UOPS_RETIRED.L2_HIT        | Retired load uops with L2 cache hits as data sources.   | Supports PEBS and DataLA.      |
| D1H        | 04H         | MEM_LOAD_UOPS_RETIRED.L3_HIT        | Retired load uops with L3 cache hits as data sources.   | Supports PEBS and DataLA.      |
| D1H        | 08H         | MEM_LOAD_UOPS_RETIRED.L1_MISS       | Retired load uops missed L1 cache as data sources.  | Supports PEBS and DataLA.      |

**Table 19-7. Performance Events of the Processor Core Supported by Broadwell Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                      | Description  | Comment                          |
|------------|-------------|--|--|----------------------------------|
| D1H        | 10H         | MEM_LOAD_UOPS_RETIRED.L2_MISS            | Retired load uops missed L2. Unknown data source excluded.   | Supports PEBS and DataLA.        |
| D1H        | 20H         | MEM_LOAD_UOPS_RETIRED.L3_MISS            | Retired load uops missed L3. Excludes unknown data source.   | Supports PEBS and DataLA.        |
| D1H        | 40H         | MEM_LOAD_UOPS_RETIRED.HIT_LFB            | Retired load uops where data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready. | Supports PEBS and DataLA.        |
| D2H        | 01H         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_MISS   | Retired load uops where data sources were L3 hit and cross-core snoop missed in on-pkg core cache.   | Supports PEBS and DataLA.        |
| D2H        | 02H         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HIT    | Retired load uops where data sources were L3 and cross-core snoop hits in on-pkg core cache.   | Supports PEBS and DataLA.        |
| D2H        | 04H         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HITM   | Retired load uops where data sources were HitM responses from shared L3.   | Supports PEBS and DataLA.        |
| D2H        | 08H         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_NONE   | Retired load uops where data sources were hits in L3 without snoops required.  | Supports PEBS and DataLA.        |
| D3H        | 01H         | MEM_LOAD_UOPS_L3_MISS_RETIRED.LOCAL_DRAM | Retired load uops where data sources missed L3 but serviced from local dram.   | Supports PEBS and DataLA.        |
| F0H        | 01H         | L2_TRANS.DEMAND_DATA_RD                  | Demand data read requests that access L2 cache.  |                                  |
| F0H        | 02H         | L2_TRANS.RFO                             | RFO requests that access L2 cache.   |                                  |
| F0H        | 04H         | L2_TRANS.CODE_RD                         | L2 cache accesses when fetching instructions.  |                                  |
| F0H        | 08H         | L2_TRANS.ALL_PF                          | Any MLC or L3 HW prefetch accessing L2, including rejects.   |                                  |
| F0H        | 10H         | L2_TRANS.L1D_WB                          | L1D writebacks that access L2 cache.   |                                  |
| F0H        | 20H         | L2_TRANS.L2_FILL                         | L2 fill requests that access L2 cache.   |                                  |
| F0H        | 40H         | L2_TRANS.L2_WB                           | L2 writebacks that access L2 cache.  |                                  |
| F0H        | 80H         | L2_TRANS.ALL_REQUESTS                    | Transactions accessing L2 pipe.  |                                  |
| F1H        | 01H         | L2_LINES_IN.I                            | L2 cache lines in I state filling L2.  | Counting does not cover rejects. |
| F1H        | 02H         | L2_LINES_IN.S                            | L2 cache lines in S state filling L2.  | Counting does not cover rejects. |
| F1H        | 04H         | L2_LINES_IN.E                            | L2 cache lines in E state filling L2.  | Counting does not cover rejects. |
| F1H        | 07H         | L2_LINES_IN.ALL                          | L2 cache lines filling L2.   | Counting does not cover rejects. |
| F2H        | 05H         | L2_LINES_OUT.DEMAND_CLEAN                | Clean L2 cache lines evicted by demand.  |                                  |

Table 19-10 lists performance events supporting Intel TSX (see Section 18.3.6.5) and the events are applicable to processors based on Broadwell microarchitecture. Where Broadwell microarchitecture implements TSX-related event semantics that differ from Table 19-10, they are listed in Table 19-8.

**Table 19-8. Intel® TSX Performance Event Addendum in Processors Based on Broadwell Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic   | Description   | Comment |
|------------|-------------|-----------------------|---|---------|
| 54H        | 02H         | TX_MEM.ABORT_CAPACITY | Number of times a transactional abort was signaled due to a data capacity limitation for transactional reads or writes. |         |

## 19.6 PERFORMANCE MONITORING EVENTS FOR THE 4TH GENERATION INTEL® CORE™ PROCESSORS

4th generation Intel® Core™ processors and Intel Xeon processor E3-1200 v3 product family are based on the Haswell microarchitecture. They support the architectural performance monitoring events listed in Table 19-1. Model-specific performance monitoring events in the processor core are listed in Table 19-9. The events in Table 19-9 apply to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following values: 06\_3CH, 06\_45H and 06\_46H. Table 19-10 lists performance events focused on supporting Intel TSX (see Section 18.3.6.5). Fixed counters in the core PMU support the architecture events defined in Table 19-2.

Additional information on event specifics (e.g., derivative events using specific IA32\_PERFVTSELx modifiers, limitations, special notes and recommendations) can be found at <https://software.intel.com/en-us/forums/software-tuning-performance-optimization-platform-monitoring>.

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors**

| Event Num. | Umask Value | Event Mask Mnemonic                   | Description  | Comment   |
|------------|-------------|---------------------------------------|--|---|
| 03H        | 02H         | LD_BLOCKS.STORE_FORWARD               | Loads blocked by overlapping with store buffer that cannot be forwarded.   |   |
| 03H        | 08H         | LD_BLOCKS.NO_SR                       | The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use. |   |
| 05H        | 01H         | MISALIGN_MEM_REF.LOADS                | Speculative cache-line split load uops dispatched to L1D.  |   |
| 05H        | 02H         | MISALIGN_MEM_REF.STORES               | Speculative cache-line split store-address uops dispatched to L1D.   |   |
| 07H        | 01H         | LD_BLOCKS_PARTIAL_ADDRESS_ALIAS       | False dependencies in MOB due to partial compare on address.   |   |
| 08H        | 01H         | DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK   | Misses in all TLB levels that cause a page walk of any page size.  |   |
| 08H        | 02H         | DTLB_LOAD_MISSES.WALK_COMPLETED_4K    | Completed page walks due to demand load misses that caused 4K page walks in any TLB levels.  |   |
| 08H        | 04H         | DTLB_LOAD_MISSES.WALK_COMPLETED_2M_4M | Completed page walks due to demand load misses that caused 2M/4M page walks in any TLB levels.   |   |
| 08H        | 0EH         | DTLB_LOAD_MISSES.WALK_COMPLETED       | Completed page walks in any TLB of any page size due to demand load misses.  |   |
| 08H        | 10H         | DTLB_LOAD_MISSES.WALK_DURATION        | Cycle PMH is busy with a walk.   |   |
| 08H        | 20H         | DTLB_LOAD_MISSES.STLB_HIT_4K          | Load misses that missed DTLB but hit STLB (4K).  |   |
| 08H        | 40H         | DTLB_LOAD_MISSES.STLB_HIT_2M          | Load misses that missed DTLB but hit STLB (2M).  |   |
| 08H        | 60H         | DTLB_LOAD_MISSES.STLB_HIT             | Number of cache load STLB hits. No page walk.  |   |
| 08H        | 80H         | DTLB_LOAD_MISSES.PDE_CACHE_MISS       | DTLB demand load misses with low part of linear-to-physical address translation missed.  |   |
| 0DH        | 03H         | INT_MISC.RECOVERY_CYCLES              | Cycles waiting to recover after Machine Clears except JEClear. Set Cmask= 1.   | Set Edge to count occurrences.                  |
| 0EH        | 01H         | UOPS_ISSUED.ANY                       | Increments each cycle the # of uops issued by the RAT to RS. Set Cmask = 1, Inv = 1, Any= 1 to count stalled cycles of this core.        | Set Cmask = 1, Inv = 1 to count stalled cycles. |
| 0EH        | 10H         | UOPS_ISSUED.FLAGS_MERGE               | Number of flags-merge uops allocated. Such uops add delay.   |   |

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic              | Description  | Comment   |
|------------|-------------|----------------------------------|--|---|
| 0EH        | 20H         | UOPS_ISSUED.SLOW_LEA             | Number of slow LEA or similar uops allocated. Such uop has 3 sources (for example, 2 sources + immediate) regardless of whether it is a result of LEA instruction or not.  |   |
| 0EH        | 40H         | UOPS_ISSUED.SINGLE_MUL           | Number of multiply packed/scalar single precision uops allocated.  |   |
| 24H        | 21H         | L2_RQSTS.DEMAND_DATA_RD_MISS     | Demand data read requests that missed L2, no rejects.  |   |
| 24H        | 41H         | L2_RQSTS.DEMAND_DATA_RD_HIT      | Demand data read requests that hit L2 cache.   |   |
| 24H        | E1H         | L2_RQSTS.ALL_DEMAND_DATA_RD      | Counts any demand and L1 HW prefetch data load requests to L2.   |   |
| 24H        | 42H         | L2_RQSTS.RFO_HIT                 | Counts the number of store RFO requests that hit the L2 cache.   |   |
| 24H        | 22H         | L2_RQSTS.RFO_MISS                | Counts the number of store RFO requests that miss the L2 cache.  |   |
| 24H        | E2H         | L2_RQSTS.ALL_RFO                 | Counts all L2 store RFO requests.  |   |
| 24H        | 44H         | L2_RQSTS.CODE_RD_HIT             | Number of instruction fetches that hit the L2 cache.   |   |
| 24H        | 24H         | L2_RQSTS.CODE_RD_MISS            | Number of instruction fetches that missed the L2 cache.  |   |
| 24H        | 27H         | L2_RQSTS.ALL_DEMAND_MISS         | Demand requests that miss L2 cache.  |   |
| 24H        | E7H         | L2_RQSTS.ALL_DEMAND_REFERENCES   | Demand requests to L2 cache.   |   |
| 24H        | E4H         | L2_RQSTS.ALL_CODE_RD             | Counts all L2 code requests.   |   |
| 24H        | 50H         | L2_RQSTS.L2_PF_HIT               | Counts all L2 HW prefetcher requests that hit L2.  |   |
| 24H        | 30H         | L2_RQSTS.L2_PF_MISS              | Counts all L2 HW prefetcher requests that missed L2.   |   |
| 24H        | F8H         | L2_RQSTS.ALL_PF                  | Counts all L2 HW prefetcher requests.  |   |
| 24H        | 3FH         | L2_RQSTS.MISS                    | All requests that missed L2.   |   |
| 24H        | FFH         | L2_RQSTS.REFERENCES              | All requests to L2 cache.  |   |
| 27H        | 50H         | L2_DEMAND_RQSTS.WB_HIT           | Not rejected writebacks that hit L2 cache.   |   |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFERENCE      | This event counts requests originating from the core that reference a cache line in the last level cache.  | See Table 19-1.                                   |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS           | This event counts each cache miss condition for references to the last level cache.  | See Table 19-1.                                   |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P        | Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling. | See Table 19-1.                                   |
| 3CH        | 01H         | CPU_CLK_THREAD_UNHALTED.REF_XCLK | Increments at the frequency of XCLK (100 MHz) when not halted.   | See Table 19-1.                                   |
| 48H        | 01H         | L1D_PEND_MISS.PENDING            | Increments the number of outstanding L1D misses every cycle. Set Cmask = 1 and Edge = 1 to count occurrences.  | Counter 2 only.<br>Set Cmask = 1 to count cycles. |

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                         | Description  | Comment                       |
|------------|-------------|---|--|-------------------------------|
| 49H        | 01H         | DTLB_STORE_MISSES.MISS_CAUSES_A_WALK        | Miss in all TLB levels causes a page walk of any page size (4K/2M/4M/1G).                          |                               |
| 49H        | 02H         | DTLB_STORE_MISSES.WALK_COMPLETED_4K         | Completed page walks due to store misses in one or more TLB levels of 4K page structure.           |                               |
| 49H        | 04H         | DTLB_STORE_MISSES.WALK_COMPLETED_2M_4M      | Completed page walks due to store misses in one or more TLB levels of 2M/4M page structure.        |                               |
| 49H        | 0EH         | DTLB_STORE_MISSES.WALK_COMPLETED            | Completed page walks due to store miss in any TLB levels of any page size (4K/2M/4M/1G).           |                               |
| 49H        | 10H         | DTLB_STORE_MISSES.WALK_DURATION             | Cycles PMH is busy with this walk.   |                               |
| 49H        | 20H         | DTLB_STORE_MISSES.STLB_HIT_4K               | Store misses that missed DTLB but hit STLB (4K).   |                               |
| 49H        | 40H         | DTLB_STORE_MISSES.STLB_HIT_2M               | Store misses that missed DTLB but hit STLB (2M).   |                               |
| 49H        | 60H         | DTLB_STORE_MISSES.STLB_HIT                  | Store operations that miss the first TLB level but hit the second and do not cause page walks.     |                               |
| 49H        | 80H         | DTLB_STORE_MISSES.PDE_CACHE_MISS            | DTLB store misses with low part of linear-to-physical address translation missed.                  |                               |
| 4CH        | 01H         | LOAD_HIT_PRE.SW_PF                          | Non-SW-prefetch load dispatches that hit fill buffer allocated for S/W prefetch.                   |                               |
| 4CH        | 02H         | LOAD_HIT_PRE.HW_PF                          | Non-SW-prefetch load dispatches that hit fill buffer allocated for H/W prefetch.                   |                               |
| 51H        | 01H         | L1D.REPLACEMENT                             | Counts the number of lines brought into the L1 data cache.   |                               |
| 58H        | 04H         | MOVE_ELIMINATION.INT_NOT_ELIMINATED         | Number of integer move elimination candidate uops that were not eliminated.                        |                               |
| 58H        | 08H         | MOVE_ELIMINATION.SIMD_NOT_ELIMINATED        | Number of SIMD move elimination candidate uops that were not eliminated.                           |                               |
| 58H        | 01H         | MOVE_ELIMINATION.INT_ELIMINATED             | Number of integer move elimination candidate uops that were eliminated.                            |                               |
| 58H        | 02H         | MOVE_ELIMINATION.SIMD_ELIMINATED            | Number of SIMD move elimination candidate uops that were eliminated.                               |                               |
| 5CH        | 01H         | CPL_CYCLES.RING0                            | Unhalted core cycles when the thread is in ring 0.   | Use Edge to count transition. |
| 5CH        | 02H         | CPL_CYCLES.RING123                          | Unhalted core cycles when the thread is not in ring 0.   |                               |
| 5EH        | 01H         | RS_EVENTS.EMPTY_CYCLES                      | Cycles the RS is empty for the thread.   |                               |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD | Offcore outstanding demand data read transactions in SQ to uncore. Set Cmask=1 to count cycles.    | Use only when HTT is off.     |
| 60H        | 02H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_CODE_RD | Offcore outstanding Demand code Read transactions in SQ to uncore. Set Cmask=1 to count cycles.    | Use only when HTT is off.     |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO     | Offcore outstanding RFO store transactions in SQ to uncore. Set Cmask=1 to count cycles.           | Use only when HTT is off.     |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD    | Offcore outstanding cacheable data read transactions in SQ to uncore. Set Cmask=1 to count cycles. | Use only when HTT is off.     |
| 63H        | 01H         | LOCK_CYCLES.SPLIT_LOCK_UC_LOCK_DURATION     | Cycles in which the L1D and L2 are locked, due to a UC lock or split lock.                         |                               |

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic               | Description  | Comment                           |
|------------|-------------|-----------------------------------|--|-----------------------------------|
| 63H        | 02H         | LOCK_CYCLES.CACHE_LOCK_DURATION   | Cycles in which the L1D is locked.   |                                   |
| 79H        | 02H         | IDQ.EMPTY                         | Counts cycles the IDQ is empty.  |                                   |
| 79H        | 04H         | IDQ.MITE_UOPS                     | Increment each cycle # of uops delivered to IDQ from MITE path. Set Cmask = 1 to count cycles.   | Can combine Umask 04H and 20H.    |
| 79H        | 08H         | IDQ.DSB_UOPS                      | Increment each cycle. # of uops delivered to IDQ from DSB path. Set Cmask = 1 to count cycles.   | Can combine Umask 08H and 10H.    |
| 79H        | 10H         | IDQ.MS_DSB_UOPS                   | Increment each cycle # of uops delivered to IDQ when MS_busy by DSB. Set Cmask = 1 to count cycles. Add Edge=1 to count # of delivery. | Can combine Umask 04H, 08H.       |
| 79H        | 20H         | IDQ.MS_MITE_UOPS                  | Increment each cycle # of uops delivered to IDQ when MS_busy by MITE. Set Cmask = 1 to count cycles.                                   | Can combine Umask 04H, 08H.       |
| 79H        | 30H         | IDQ.MS_UOPS                       | Increment each cycle # of uops delivered to IDQ from MS by either DSB or MITE. Set Cmask = 1 to count cycles.                          | Can combine Umask 04H, 08H.       |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_ANY_UOPS       | Counts cycles DSB is delivered at least one uops. Set Cmask = 1.   |                                   |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_4_UOPS         | Counts cycles DSB is delivered four uops. Set Cmask = 4.   |                                   |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_ANY_UOPS      | Counts cycles MITE is delivered at least one uop. Set Cmask = 1.   |                                   |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_4_UOPS        | Counts cycles MITE is delivered four uops. Set Cmask = 4.  |                                   |
| 79H        | 3CH         | IDQ.MITE_ALL_UOPS                 | # of uops delivered to IDQ from any path.  |                                   |
| 80H        | 02H         | ICACHE.MISSES                     | Number of Instruction Cache, Streaming Buffer and Victim Cache Misses. Includes UC accesses.   |                                   |
| 85H        | 01H         | ITLB_MISSES.MISS_CAUSES_A_WALK    | Misses in ITLB that causes a page walk of any page size.   |                                   |
| 85H        | 02H         | ITLB_MISSES.WALK_COMPLETE_D_4K    | Completed page walks due to misses in ITLB 4K page entries.  |                                   |
| 85H        | 04H         | ITLB_MISSES.WALK_COMPLETE_D_2M_4M | Completed page walks due to misses in ITLB 2M/4M page entries.   |                                   |
| 85H        | 0EH         | ITLB_MISSES.WALK_COMPLETE_D       | Completed page walks in ITLB of any page size.   |                                   |
| 85H        | 10H         | ITLB_MISSES.WALK_DURATION         | Cycle PMH is busy with a walk.   |                                   |
| 85H        | 20H         | ITLB_MISSES.STLB_HIT_4K           | ITLB misses that hit STLB (4K).  |                                   |
| 85H        | 40H         | ITLB_MISSES.STLB_HIT_2M           | ITLB misses that hit STLB (2M).  |                                   |
| 85H        | 60H         | ITLB_MISSES.STLB_HIT              | ITLB misses that hit STLB. No page walk.   |                                   |
| 87H        | 01H         | ILD_STALL.LCP                     | Stalls caused by changing prefix length of the instruction.  |                                   |
| 87H        | 04H         | ILD_STALL.IQ_FULL                 | Stall cycles due to IQ is full.  |                                   |
| 88H        | 01H         | BR_INST_EXEC.COND                 | Qualify conditional near branch instructions executed, but not necessarily retired.  | Must combine with umask 40H, 80H. |
| 88H        | 02H         | BR_INST_EXEC.DIRECT_JMP           | Qualify all unconditional near branch instructions excluding calls and indirect branches.  | Must combine with umask 80H.      |

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description   | Comment                           |
|------------|-------------|--|---|-----------------------------------|
| 88H        | 04H         | BR_INST_EXEC.INDIRECT_JMP_NON_CALL_RET | Qualify executed indirect near branch instructions that are not calls or returns.   | Must combine with umask 80H.      |
| 88H        | 08H         | BR_INST_EXEC.RETURN_NEAR               | Qualify indirect near branches that have a return mnemonic.   | Must combine with umask 80H.      |
| 88H        | 10H         | BR_INST_EXEC.DIRECT_NEAR_CALL          | Qualify unconditional near call branch instructions, excluding non-call branch, executed.                                 | Must combine with umask 80H.      |
| 88H        | 20H         | BR_INST_EXEC.INDIRECT_NEAR_CALL        | Qualify indirect near calls, including both register and memory indirect, executed.                                       | Must combine with umask 80H.      |
| 88H        | 40H         | BR_INST_EXEC.NONTAKEN                  | Qualify non-taken near branches executed.   | Applicable to umask 01H only.     |
| 88H        | 80H         | BR_INST_EXEC.TAKEN                     | Qualify taken near branches executed. Must combine with 01H, 02H, 04H, 08H, 10H, 20H.                                     |                                   |
| 88H        | FFH         | BR_INST_EXEC.ALL_BRANCHES              | Counts all near executed branches (not necessarily retired).  |                                   |
| 89H        | 01H         | BR_MISP_EXEC.COND                      | Qualify conditional near branch instructions mispredicted.  | Must combine with umask 40H, 80H. |
| 89H        | 04H         | BR_MISP_EXEC.INDIRECT_JMP_NON_CALL_RET | Qualify mispredicted indirect near branch instructions that are not calls or returns.                                     | Must combine with umask 80H.      |
| 89H        | 08H         | BR_MISP_EXEC.RETURN_NEAR               | Qualify mispredicted indirect near branches that have a return mnemonic.  | Must combine with umask 80H.      |
| 89H        | 10H         | BR_MISP_EXEC.DIRECT_NEAR_CALL          | Qualify mispredicted unconditional near call branch instructions, excluding non-call branch, executed.                    | Must combine with umask 80H.      |
| 89H        | 20H         | BR_MISP_EXEC.INDIRECT_NEAR_CALL        | Qualify mispredicted indirect near calls, including both register and memory indirect, executed.                          | Must combine with umask 80H.      |
| 89H        | 40H         | BR_MISP_EXEC.NONTAKEN                  | Qualify mispredicted non-taken near branches executed.  | Applicable to umask 01H only.     |
| 89H        | 80H         | BR_MISP_EXEC.TAKEN                     | Qualify mispredicted taken near branches executed. Must combine with 01H, 02H, 04H, 08H, 10H, 20H.                        |                                   |
| 89H        | FFH         | BR_MISP_EXEC.ALL_BRANCHES              | Counts all near executed branches (not necessarily retired).  |                                   |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CORE            | Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back-end stall. | Use Cmask to qualify uop b/w.     |
| A1H        | 01H         | UOPS_EXECUTED_PORT.PORT_0              | Cycles which a uop is dispatched on port 0 in this thread.  | Set AnyThread to count per core.  |
| A1H        | 02H         | UOPS_EXECUTED_PORT.PORT_1              | Cycles which a uop is dispatched on port 1 in this thread.  | Set AnyThread to count per core.  |
| A1H        | 04H         | UOPS_EXECUTED_PORT.PORT_2              | Cycles which a uop is dispatched on port 2 in this thread.  | Set AnyThread to count per core.  |
| A1H        | 08H         | UOPS_EXECUTED_PORT.PORT_3              | Cycles which a uop is dispatched on port 3 in this thread.  | Set AnyThread to count per core.  |
| A1H        | 10H         | UOPS_EXECUTED_PORT.PORT_4              | Cycles which a uop is dispatched on port 4 in this thread.  | Set AnyThread to count per core.  |
| A1H        | 20H         | UOPS_EXECUTED_PORT.PORT_5              | Cycles which a uop is dispatched on port 5 in this thread.  | Set AnyThread to count per core.  |
| A1H        | 40H         | UOPS_EXECUTED_PORT.PORT_6              | Cycles which a uop is dispatched on port 6 in this thread.  | Set AnyThread to count per core.  |

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic               | Description  | Comment                          |
|------------|-------------|-----------------------------------|--|----------------------------------|
| A1H        | 80H         | UOPS_EXECUTED.PORT.PORT_7         | Cycles which a uop is dispatched on port 7 in this thread                            | Set AnyThread to count per core. |
| A2H        | 01H         | RESOURCE_STALLS.ANY               | Cycles allocation is stalled due to resource related reason.                         |                                  |
| A2H        | 04H         | RESOURCE_STALLS.RS                | Cycles stalled due to no eligible RS entry available.                                |                                  |
| A2H        | 08H         | RESOURCE_STALLS.SB                | Cycles stalled due to no store buffers available (not including draining from sync). |                                  |
| A2H        | 10H         | RESOURCE_STALLS.ROB               | Cycles stalled due to re-order buffer full.  |                                  |
| A3H        | 01H         | CYCLE_ACTIVITY.CYCLES_L2_PENDING  | Cycles with pending L2 miss loads. Set Cmask=2 to count cycle.                       | Use only when HTT is off.        |
| A3H        | 02H         | CYCLE_ACTIVITY.CYCLES_LDM_PENDING | Cycles with pending memory loads. Set Cmask=2 to count cycle.                        |                                  |
| A3H        | 05H         | CYCLE_ACTIVITY.STALLS_L2_PENDING  | Number of loads missed L2.   | Use only when HTT is off.        |
| A3H        | 08H         | CYCLE_ACTIVITY.CYCLES_L1D_PENDING | Cycles with pending L1 data cache miss loads. Set Cmask=8 to count cycle.            | PMC2 only.                       |
| A3H        | 0CH         | CYCLE_ACTIVITY.STALLS_L1D_PENDING | Execution stalls due to L1 data cache miss loads. Set Cmask=0CH.                     | PMC2 only.                       |
| A8H        | 01H         | LSD.UOPS                          | Number of uops delivered by the LSD.   |                                  |
| AEH        | 01H         | ITLB.ITLB_FLUSH                   | Counts the number of ITLB flushes, includes 4k/2M/4M pages.                          |                                  |
| B0H        | 01H         | OFFCORE_REQUESTS.DEMAND_DATA_RD   | Demand data read requests sent to uncore.  | Use only when HTT is off.        |
| B0H        | 02H         | OFFCORE_REQUESTS.DEMAND_CODE_RD   | Demand code read requests sent to uncore.  | Use only when HTT is off.        |
| B0H        | 04H         | OFFCORE_REQUESTS.DEMAND_RFO       | Demand RFO read requests sent to uncore, including regular RFOs, locks, ltoM.        | Use only when HTT is off.        |
| B0H        | 08H         | OFFCORE_REQUESTS.ALL_DATA_RD      | Data read requests sent to uncore (demand and prefetch).                             | Use only when HTT is off.        |
| B1H        | 02H         | UOPS_EXECUTED.CORE                | Counts total number of uops to be executed per-core each cycle.                      | Do not need to set ANY.          |
| B7H        | 01H         | OFF_CORE_RESPONSE_0               | See Table 18-28 or Table 18-29.  | Requires MSR 01A6H.              |
| BBH        | 01H         | OFF_CORE_RESPONSE_1               | See Table 18-28 or Table 18-29.  | Requires MSR 01A7H.              |
| BCH        | 11H         | PAGE_WALKER_LOADS.DTLB_L1         | Number of DTLB page walker loads that hit in the L1+FB.                              |                                  |
| BCH        | 21H         | PAGE_WALKER_LOADS.ITLB_L1         | Number of ITLB page walker loads that hit in the L1+FB.                              |                                  |
| BCH        | 12H         | PAGE_WALKER_LOADS.DTLB_L2         | Number of DTLB page walker loads that hit in the L2.                                 |                                  |
| BCH        | 22H         | PAGE_WALKER_LOADS.ITLB_L2         | Number of ITLB page walker loads that hit in the L2.                                 |                                  |
| BCH        | 14H         | PAGE_WALKER_LOADS.DTLB_L3         | Number of DTLB page walker loads that hit in the L3.                                 |                                  |
| BCH        | 24H         | PAGE_WALKER_LOADS.ITLB_L3         | Number of ITLB page walker loads that hit in the L3.                                 |                                  |
| BCH        | 18H         | PAGE_WALKER_LOADS.DTLB_MEMORY     | Number of DTLB page walker loads from memory.  |                                  |
| BCH        | 28H         | PAGE_WALKER_LOADS.ITLB_MEMORY     | Number of ITLB page walker loads from memory.  |                                  |

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description  | Comment  |
|------------|-------------|--------------------------------|--|--|
| BDH        | 01H         | TLB_FLUSH.DTLB_THREAD          | DTLB flush attempts of the thread-specific entries.  |  |
| BDH        | 20H         | TLB_FLUSH.STLB_ANY             | Count number of STLB flush attempts.   |  |
| COH        | 00H         | INST_RETIRED.ANY_P             | Number of instructions at retirement.  | See Table 19-1.  |
| COH        | 01H         | INST_RETIRED.PREC_DIST         | Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.                                | PMC1 only.   |
| C1H        | 08H         | OTHER_ASSISTS.AVX_TO_SSE       | Number of transitions from AVX-256 to legacy SSE when penalty applicable.  |  |
| C1H        | 10H         | OTHER_ASSISTS.SSE_TO_AVX       | Number of transitions from SSE to AVX-256 when penalty applicable.   |  |
| C1H        | 40H         | OTHER_ASSISTS.ANY_WB_ASSIST    | Number of microcode assists invoked by HW upon uop writeback.  |  |
| C2H        | 01H         | UOPS_RETIRED.ALL               | Counts the number of micro-ops retired. Use Cmask=1 and invert to count active cycles or stalled cycles.                     | Supports PEBS and DataLA; use Any=1 for core granular. |
| C2H        | 02H         | UOPS_RETIRED.RETIRE_SLOTS      | Counts the number of retirement slots used each cycle.   | Supports PEBS.   |
| C3H        | 02H         | MACHINE_CLEARS.MEMORY_ORDERING | Counts the number of machine clears due to memory order conflicts.   |  |
| C3H        | 04H         | MACHINE_CLEARS.SMC             | Number of self-modifying-code machine clears detected.   |  |
| C3H        | 20H         | MACHINE_CLEARS.MASKMOV         | Counts the number of executed AVX masked load operations that refer to an illegal address range with the mask bits set to 0. |  |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES   | Branch instructions at retirement.   | See Table 19-1.  |
| C4H        | 01H         | BR_INST_RETIRED.CONDITIONAL    | Counts the number of conditional branch instructions retired.  | Supports PEBS.   |
| C4H        | 02H         | BR_INST_RETIRED.NEAR_CALL      | Direct and indirect near call instructions retired.  | Supports PEBS.   |
| C4H        | 04H         | BR_INST_RETIRED.ALL_BRANCHES   | Counts the number of branch instructions retired.  | Supports PEBS.   |
| C4H        | 08H         | BR_INST_RETIRED.NEAR_RETURN    | Counts the number of near return instructions retired.   | Supports PEBS.   |
| C4H        | 10H         | BR_INST_RETIRED.NOT_TAKEN      | Counts the number of not taken branch instructions retired.  |  |
| C4H        | 20H         | BR_INST_RETIRED.NEAR_TAKEN     | Number of near taken branches retired.   | Supports PEBS.   |
| C4H        | 40H         | BR_INST_RETIRED.FAR_BRANCH     | Number of far branches retired.  |  |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANCHES   | Mispredicted branch instructions at retirement.  | See Table 19-1.  |
| C5H        | 01H         | BR_MISP_RETIRED.CONDITIONAL    | Mispredicted conditional branch instructions retired.  | Supports PEBS.   |
| C5H        | 04H         | BR_MISP_RETIRED.ALL_BRANCHES   | Mispredicted macro branch instructions retired.  | Supports PEBS.   |
| C5H        | 20H         | BR_MISP_RETIRED.NEAR_TAKEN     | Number of near branch instructions retired that were taken but mispredicted.   |  |

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description   | Comment                        |
|------------|-------------|--|---|--------------------------------|
| CAH        | 02H         | FP_ASSIST.X87_OUTPUT                   | Number of X87 FP assists due to output values.  |                                |
| CAH        | 04H         | FP_ASSIST.X87_INPUT                    | Number of X87 FP assists due to input values.   |                                |
| CAH        | 08H         | FP_ASSIST.SIMD_OUTPUT                  | Number of SIMD FP assists due to output values.   |                                |
| CAH        | 10H         | FP_ASSIST.SIMD_INPUT                   | Number of SIMD FP assists due to input values.  |                                |
| CAH        | 1EH         | FP_ASSIST.ANY                          | Cycles with any input/output SSE* or FP assists.  |                                |
| CCH        | 20H         | ROB_MISC_EVENTS.LBR_INSERTS            | Count cases of saving new LBR records by hardware.  |                                |
| CDH        | 01H         | MEM_TRANS_RETIRED.LOAD_LATENCY         | Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization. | Specify threshold in MSR 3F6H. |
| DOH        | 11H         | MEM_UOPS_RETIRED.STLB_MISSES_LOADS     | Retired load uops that miss the STLB.   | Supports PEBS and DataLA.      |
| DOH        | 12H         | MEM_UOPS_RETIRED.STLB_MISSES_STORES    | Retired store uops that miss the STLB.  | Supports PEBS and DataLA.      |
| DOH        | 21H         | MEM_UOPS_RETIRED.LOCK_LOADS            | Retired load uops with locked access.   | Supports PEBS and DataLA.      |
| DOH        | 41H         | MEM_UOPS_RETIRED.SPLIT_LOADS           | Retired load uops that split across a cacheline boundary.   | Supports PEBS and DataLA.      |
| DOH        | 42H         | MEM_UOPS_RETIRED.SPLIT_STORES          | Retired store uops that split across a cacheline boundary.  | Supports PEBS and DataLA.      |
| DOH        | 81H         | MEM_UOPS_RETIRED.ALL_LOADS             | All retired load uops.  | Supports PEBS and DataLA.      |
| DOH        | 82H         | MEM_UOPS_RETIRED.ALL_STORES            | All retired store uops.   | Supports PEBS and DataLA.      |
| D1H        | 01H         | MEM_LOAD_UOPS_RETIRED.L1_HIT           | Retired load uops with L1 cache hits as data sources.   | Supports PEBS and DataLA.      |
| D1H        | 02H         | MEM_LOAD_UOPS_RETIRED.L2_HIT           | Retired load uops with L2 cache hits as data sources.   | Supports PEBS and DataLA.      |
| D1H        | 04H         | MEM_LOAD_UOPS_RETIRED.L3_HIT           | Retired load uops with L3 cache hits as data sources.   | Supports PEBS and DataLA.      |
| D1H        | 08H         | MEM_LOAD_UOPS_RETIRED.L1_MISS          | Retired load uops missed L1 cache as data sources.  | Supports PEBS and DataLA.      |
| D1H        | 10H         | MEM_LOAD_UOPS_RETIRED.L2_MISS          | Retired load uops missed L2. Unknown data source excluded.  | Supports PEBS and DataLA.      |
| D1H        | 20H         | MEM_LOAD_UOPS_RETIRED.L3_MISS          | Retired load uops missed L3. Excludes unknown data source.  | Supports PEBS and DataLA.      |
| D1H        | 40H         | MEM_LOAD_UOPS_RETIRED.HIT_LFB          | Retired load uops which data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready.      | Supports PEBS and DataLA.      |
| D2H        | 01H         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_MISS | Retired load uops which data sources were L3 hit and cross-core snoop missed in on-pkg core cache.  | Supports PEBS and DataLA.      |
| D2H        | 02H         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HIT  | Retired load uops which data sources were L3 and cross-core snoop hits in on-pkg core cache.  | Supports PEBS and DataLA.      |
| D2H        | 04H         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_HITM | Retired load uops which data sources were HitM responses from shared L3.  | Supports PEBS and DataLA.      |

**Table 19-9. Performance Events in the Processor Core of 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                      | Description   | Comment                          |
|------------|-------------|--|---|----------------------------------|
| D2H        | 08H         | MEM_LOAD_UOPS_L3_HIT_RETIRED.XSNP_NONE   | Retired load uops which data sources were hits in L3 without snoops required. | Supports PEBS and DataLA.        |
| D3H        | 01H         | MEM_LOAD_UOPS_L3_MISS_RETIRED.LOCAL_DRAM | Retired load uops which data sources missed L3 but serviced from local dram.  | Supports PEBS and DataLA.        |
| E6H        | 1FH         | BACLEAR.S.ANY                            | Number of front end re-steers due to BPU misprediction.                       |                                  |
| F0H        | 01H         | L2_TRANS.DEMAND_DATA_RD                  | Demand data read requests that access L2 cache.                               |                                  |
| F0H        | 02H         | L2_TRANS.RFO                             | RFO requests that access L2 cache.  |                                  |
| F0H        | 04H         | L2_TRANS.CODE_RD                         | L2 cache accesses when fetching instructions.                                 |                                  |
| F0H        | 08H         | L2_TRANS.ALL_PF                          | Any MLC or L3 HW prefetch accessing L2, including rejects.                    |                                  |
| F0H        | 10H         | L2_TRANS.L1D_WB                          | L1D writebacks that access L2 cache.  |                                  |
| F0H        | 20H         | L2_TRANS.L2_FILL                         | L2 fill requests that access L2 cache.  |                                  |
| F0H        | 40H         | L2_TRANS.L2_WB                           | L2 writebacks that access L2 cache.   |                                  |
| F0H        | 80H         | L2_TRANS.ALL_REQUESTS                    | Transactions accessing L2 pipe.   |                                  |
| F1H        | 01H         | L2_LINES_IN.I                            | L2 cache lines in I state filling L2.   | Counting does not cover rejects. |
| F1H        | 02H         | L2_LINES_IN.S                            | L2 cache lines in S state filling L2.   | Counting does not cover rejects. |
| F1H        | 04H         | L2_LINES_IN.E                            | L2 cache lines in E state filling L2.   | Counting does not cover rejects. |
| F1H        | 07H         | L2_LINES_IN.ALL                          | L2 cache lines filling L2.  | Counting does not cover rejects. |
| F2H        | 05H         | L2_LINES_OUT.DEMAND_CLEAN                | Clean L2 cache lines evicted by demand.                                       |                                  |
| F2H        | 06H         | L2_LINES_OUT.DEMAND_DIRTY                | Dirty L2 cache lines evicted by demand.                                       |                                  |

**Table 19-10. Intel TSX Performance Events in Processors Based on Haswell Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic                                   | Description  | Comment |
|------------|-------------|---|--|---------|
| 54H        | 01H         | TX_MEM.ABORT_CONFLICT                                 | Number of times a transactional abort was signaled due to a data conflict on a transactionally accessed address.                                     |         |
| 54H        | 02H         | TX_MEM.ABORT_CAPACITY_WRITE                           | Number of times a transactional abort was signaled due to a data capacity limitation for transactional writes.                                       |         |
| 54H        | 04H         | TX_MEM.ABORT_HLE_STORE_TO_ELIDED_LOCK                 | Number of times a HLE transactional region aborted due to a non XRELEASE prefixed instruction writing to an elided lock in the elision buffer.       |         |
| 54H        | 08H         | TX_MEM.ABORT_HLE_ELISION_BUFFER_NOT_EMPTY             | Number of times an HLE transactional execution aborted due to NoAllocatedElisionBuffer being non-zero.   |         |
| 54H        | 10H         | TX_MEM.ABORT_HLE_ELISION_BUFFER_MISMATCH              | Number of times an HLE transactional execution aborted due to XRELEASE lock not satisfying the address and value requirements in the elision buffer. |         |
| 54H        | 20H         | TX_MEM.ABORT_HLE_ELISION_BUFFER_UNSUPPORTED_ALIGNMENT | Number of times an HLE transactional execution aborted due to an unsupported read alignment from the elision buffer.                                 |         |

**Table 19-10. Intel TSX Performance Events in Processors Based on Haswell Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic             | Description  | Comment              |
|------------|-------------|---------------------------------|--|----------------------|
| 54H        | 40H         | TX_MEM.HLE_ELISION_BUFFER_FULL  | Number of times HLE lock could not be elided due to ElisionBufferAvailable being zero.   |                      |
| 5DH        | 01H         | TX_EXEC.MISC1                   | Counts the number of times a class of instructions that may cause a transactional abort was executed. Since this is the count of execution, it may not always cause a transactional abort. |                      |
| 5DH        | 02H         | TX_EXEC.MISC2                   | Counts the number of times a class of instructions (for example, vzeroupper) that may cause a transactional abort was executed inside a transactional region.                              |                      |
| 5DH        | 04H         | TX_EXEC.MISC3                   | Counts the number of times an instruction execution caused the transactional nest count supported to be exceeded.  |                      |
| 5DH        | 08H         | TX_EXEC.MISC4                   | Counts the number of times an XBEGIN instruction was executed inside an HLE transactional region.  |                      |
| 5DH        | 10H         | TX_EXEC.MISC5                   | Counts the number of times an instruction with HLE-XACQUIRE semantic was executed inside an RTM transactional region.  |                      |
| C8H        | 01H         | HLE_RETIRED.START               | Number of times an HLE execution started.  | If HLE is supported. |
| C8H        | 02H         | HLE_RETIRED.COMMIT              | Number of times an HLE execution successfully committed.   |                      |
| C8H        | 04H         | HLE_RETIRED.ABORTED             | Number of times an HLE execution aborted due to any reasons (multiple categories may count as one). Supports PEBS.   |                      |
| C8H        | 08H         | HLE_RETIRED.ABORTED_MEM         | Number of times an HLE execution aborted due to various memory events (for example, read/write capacity and conflicts).  |                      |
| C8H        | 10H         | HLE_RETIRED.ABORTED_TIME        | Number of times an HLE execution aborted due to uncommon conditions.   |                      |
| C8H        | 20H         | HLE_RETIRED.ABORTED_UNFRIENDLY  | Number of times an HLE execution aborted due to HLE-unfriendly instructions.   |                      |
| C8H        | 40H         | HLE_RETIRED.ABORTED_MEMORY_TYPE | Number of times an HLE execution aborted due to incompatible memory type.  |                      |
| C8H        | 80H         | HLE_RETIRED.ABORTED_OTHER       | Number of times an HLE execution aborted due to none of the previous 4 categories (for example, interrupts).   |                      |
| C9H        | 01H         | RTM_RETIRED.START               | Number of times an RTM execution started.  | If RTM is supported. |
| C9H        | 02H         | RTM_RETIRED.COMMIT              | Number of times an RTM execution successfully committed.   |                      |
| C9H        | 04H         | RTM_RETIRED.ABORTED             | Number of times an RTM execution aborted due to any reasons (multiple categories may count as one). Supports PEBS.   |                      |

**Table 19-10. Intel TSX Performance Events in Processors Based on Haswell Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description   | Comment              |
|------------|-------------|--------------------------------|---|----------------------|
| C9H        | 08H         | RTM_RETIREDA.BORTED_MEM        | Number of times an RTM execution aborted due to various memory events (for example, read/write capacity and conflicts). | If RTM is supported. |
| C9H        | 10H         | RTM_RETIREDA.BORTED_TIME R     | Number of times an RTM execution aborted due to uncommon conditions.  |                      |
| C9H        | 20H         | RTM_RETIREDA.BORTED_UNFRIENDLY | Number of times an RTM execution aborted due to HLE-unfriendly instructions.  |                      |
| C9H        | 40H         | RTM_RETIREDA.BORTED_MEMTYPE    | Number of times an RTM execution aborted due to incompatible memory type.   |                      |
| C9H        | 80H         | RTM_RETIREDA.BORTED_EVENTS     | Number of times an RTM execution aborted due to none of the previous 4 categories (for example, interrupt).             |                      |

Model-specific performance monitoring events that are located in the uncore sub-system are implementation specific between different platforms using processors based on Haswell microarchitecture and with different DisplayFamily\_DisplayModel signatures. Processors with CPUID signature of DisplayFamily\_DisplayModel 06\_3CH and 06\_45H support performance events listed in Table 19-11.

**Table 19-11. Uncore Performance Events in the 4th Generation Intel® Core™ Processors**

| Event Num. <sup>1</sup> | Umask Value | Event Mask Mnemonic                   | Description   | Comment  |
|-------------------------|-------------|---------------------------------------|---|--|
| 22H                     | 01H         | UNC_CBO_XSNP_RESPONSE.MISS            | A snoop misses in some processor core.  | Must combine with one of the umask values of 20H, 40H, 80H.      |
| 22H                     | 02H         | UNC_CBO_XSNP_RESPONSE.INVALID         | A snoop invalidates a non-modified line in some processor core.   |  |
| 22H                     | 04H         | UNC_CBO_XSNP_RESPONSE.HIT             | A snoop hits a non-modified line in some processor core.  |  |
| 22H                     | 08H         | UNC_CBO_XSNP_RESPONSE.HITM            | A snoop hits a modified line in some processor core.  |  |
| 22H                     | 10H         | UNC_CBO_XSNP_RESPONSE.INVALID_M       | A snoop invalidates a modified line in some processor core.   |  |
| 22H                     | 20H         | UNC_CBO_XSNP_RESPONSE.EXTERNAL_FILTER | Filter on cross-core snoops initiated by this Cbox due to external snoop request.                                 | Must combine with at least one of 01H, 02H, 04H, 08H, 10H.       |
| 22H                     | 40H         | UNC_CBO_XSNP_RESPONSE.CORE_FILTER     | Filter on cross-core snoops initiated by this Cbox due to processor core memory request.                          |  |
| 22H                     | 80H         | UNC_CBO_XSNP_RESPONSE.EVICTION_FILTER | Filter on cross-core snoops initiated by this Cbox due to L3 eviction.  |  |
| 34H                     | 01H         | UNC_CBO_CACHE_LOOKUP.M                | L3 lookup request that access cache and found line in M-state.  | Must combine with one of the umask values of 10H, 20H, 40H, 80H. |
| 34H                     | 06H         | UNC_CBO_CACHE_LOOKUP.E                | L3 lookup request that access cache and found line in E or S state.   |  |
| 34H                     | 08H         | UNC_CBO_CACHE_LOOKUP.I                | L3 lookup request that access cache and found line in I-state.  |  |
| 34H                     | 10H         | UNC_CBO_CACHE_LOOKUP.READ_FILTER      | Filter on processor core initiated cacheable read requests. Must combine with at least one of 01H, 02H, 04H, 08H. |  |

**Table 19-11. Uncore Performance Events in the 4th Generation Intel® Core™ Processors (Contd.)**

| Event Num. <sup>1</sup> | Umask Value | Event Mask Mnemonic                     | Description  | Comment         |
|-------------------------|-------------|---|--|-----------------|
| 34H                     | 20H         | UNC_CBO_CACHE_LOOKUP.WRITE_FILTER       | Filter on processor core initiated cacheable write requests. Must combine with at least one of 01H, 02H, 04H, 08H.   |                 |
| 34H                     | 40H         | UNC_CBO_CACHE_LOOKUP.EXTSNP_FILTER      | Filter on external snoop requests. Must combine with at least one of 01H, 02H, 04H, 08H.   |                 |
| 34H                     | 80H         | UNC_CBO_CACHE_LOOKUP.ANY_REQUEST_FILTER | Filter on any IRQ or IPQ initiated requests including uncacheable, non-coherent requests. Must combine with at least one of 01H, 02H, 04H, 08H.  |                 |
| 80H                     | 01H         | UNC_ARB_TRK_OCCUPANCY.ALL               | Counts cycles weighted by the number of requests waiting for data returning from the memory controller. Accounts for coherent and non-coherent requests initiated by IA cores, processor graphic units, or L3. | Counter 0 only. |
| 81H                     | 01H         | UNC_ARB_TRK_REQUEST.ALL                 | Counts the number of coherent and in-coherent requests initiated by IA cores, processor graphic units, or L3.  |                 |
| 81H                     | 20H         | UNC_ARB_TRK_REQUEST.WRITES              | Counts the number of allocated write entries, include full, partial, and L3 evictions.   |                 |
| 81H                     | 80H         | UNC_ARB_TRK_REQUEST.EVICTIONS           | Counts the number of L3 evictions allocated.   |                 |
| 83H                     | 01H         | UNC_ARB_COH_TRK_OCCUPANCY.ALL           | Cycles weighted by number of requests pending in Coherency Tracker.  | Counter 0 only. |
| 84H                     | 01H         | UNC_ARB_COH_TRK_REQUEST.ALL             | Number of requests allocated in Coherency Tracker.   |                 |

**NOTES:**

1. The uncore events must be programmed using MSRs located in specific performance monitoring units in the uncore. UNC\_CBO\* events are supported using MSR\_UNC\_CBO\* MSRs; UNC\_ARB\* events are supported using MSR\_UNC\_ARB\* MSRs.

## 19.6.1 Performance Monitoring Events in the Processor Core of Intel Xeon Processor E5 v3 Family

Model-specific performance monitoring events in the processor core that are applicable only to Intel Xeon processor E5 v3 family based on the Haswell-E microarchitecture, with CPUID signature of DisplayFamily\_DisplayModel 06\_3FH, are listed in Table 19-12. The performance events listed in Table 19-9 and Table 19-10 also apply Intel Xeon processor E5 v3 family, except that the OFF\_CORE\_RESPONSE\_x event listed in Table 19-9 should reference Table 18-30.

Uncore performance monitoring events for Intel Xeon Processor E5 v3 families are described in “Intel® Xeon® Processor E5 v3 Uncore Performance Monitoring Programming Reference Manual”.

**Table 19-12. Performance Events Applicable only to the Processor Core of Intel® Xeon® Processor E5 v3 Family**

| Event Num. | Umask Value | Event Mask Mnemonic                       | Description   | Comment        |
|------------|-------------|---|---|----------------|
| D3H        | 04H         | MEM_LOAD_UOPS_L3_MISS_RETIRED.REMOTE_DRAM | Retired load uops whose data sources were remote DRAM (snoop not needed, Snoop Miss). | Supports PEBS. |
| D3H        | 10H         | MEM_LOAD_UOPS_L3_MISS_RETIRED.REMOTE_HITM | Retired load uops whose data sources were remote cache HITM.                          | Supports PEBS. |
| D3H        | 20H         | MEM_LOAD_UOPS_L3_MISS_RETIRED.REMOTE_FWD  | Retired load uops whose data sources were forwards from a remote cache.               | Supports PEBS. |

## 19.7 PERFORMANCE MONITORING EVENTS FOR 3RD GENERATION INTEL® CORE™ PROCESSORS

3rd generation Intel® Core™ processors and Intel Xeon processor E3-1200 v2 product family are based on Intel microarchitecture code name Ivy Bridge. They support architectural performance monitoring events listed in Table 19-1. Model-specific performance monitoring events in the processor core are listed in Table 19-13. The events in Table 19-13 apply to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following values: 06\_3AH. Fixed counters in the core PMU support the architecture events defined in Table 19-24.

Additional information on event specifics (e.g. derivative events using specific IA32\_PERFECTSELx modifiers, limitations, special notes and recommendations) can be found at <https://software.intel.com/en-us/forums/software-tuning-performance-optimization-platform-monitoring>.

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors**

| Event Num. | Umask Value | Event Mask Mnemonic                       | Description  | Comment   |
|------------|-------------|---|--|---|
| 03H        | 02H         | LD_BLOCKS.STORE_FORWARD                   | Loads blocked by overlapping with store buffer that cannot be forwarded.   |   |
| 03H        | 08H         | LD_BLOCKS.NO_SR                           | The number of times that split load operations are temporarily blocked because all resources for handling the split accesses are in use.               |   |
| 05H        | 01H         | MISALIGN_MEM_REF.LOADS                    | Speculative cache-line split load uops dispatched to L1D.  |   |
| 05H        | 02H         | MISALIGN_MEM_REF.STORES                   | Speculative cache-line split Store-address uops dispatched to L1D.   |   |
| 07H        | 01H         | LD_BLOCKS_PARTIAL.ADDRESS_ALIAS           | False dependencies in MOB due to partial compare on address.   |   |
| 08H        | 81H         | DTLB_LOAD_MISSES.MISS_CAUSE_S_A_WALK      | Misses in all TLB levels that cause a page walk of any page size from demand loads.  |   |
| 08H        | 82H         | DTLB_LOAD_MISSES.WALK_COMPLETED           | Misses in all TLB levels that caused page walk completed of any size by demand loads.  |   |
| 08H        | 84H         | DTLB_LOAD_MISSES.WALK_DURATION            | Cycle PMH is busy with a walk due to demand loads.   |   |
| 08H        | 88H         | DTLB_LOAD_MISSES.LARGE_PAGE_WALK_DURATION | Page walk for a large page completed for Demand load.  |   |
| 0EH        | 01H         | UOPS_ISSUED.ANY                           | Increments each cycle the # of Uops issued by the RAT to RS. Set Cmask = 1, Inv = 1, Any = 1 to count stalled cycles of this core.                     | Set Cmask = 1, Inv = 1 to count stalled cycles. |
| 0EH        | 10H         | UOPS_ISSUED.FLAGS_MERGE                   | Number of flags-merge uops allocated. Such uops adds delay.  |   |
| 0EH        | 20H         | UOPS_ISSUED.SLOW_LEA                      | Number of slow LEA or similar uops allocated. Such uop has 3 sources (e.g. 2 sources + immediate) regardless if as a result of LEA instruction or not. |   |
| 0EH        | 40H         | UOPS_ISSUED.SINGLE_MUL                    | Number of multiply packed/scalar single precision uops allocated.  |   |
| 10H        | 01H         | FP_COMP_OPS_EXE.X87                       | Counts number of X87 uops executed.  |   |
| 10H        | 10H         | FP_COMP_OPS_EXE.SSE_FP_PACKED_DOUBLE      | Counts number of SSE* or AVX-128 double precision FP packed uops executed.   |   |
| 10H        | 20H         | FP_COMP_OPS_EXE.SSE_FP_SCALAR_SINGLE      | Counts number of SSE* or AVX-128 single precision FP scalar uops executed.   |   |
| 10H        | 40H         | FP_COMP_OPS_EXE.SSE_PACKED_SINGLE         | Counts number of SSE* or AVX-128 single precision FP packed uops executed.   |   |

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic               | Description  | Comment         |
|------------|-------------|-----------------------------------|--|-----------------|
| 10H        | 80H         | FP_COMP_OPS_EXE.SSE_SCALAR_DOUBLE | Counts number of SSE* or AVX-128 double precision FP scalar uops executed.   |                 |
| 11H        | 01H         | SIMD_FP_256.PACKED_SINGLE         | Counts 256-bit packed single-precision floating-point instructions.  |                 |
| 11H        | 02H         | SIMD_FP_256.PACKED_DOUBLE         | Counts 256-bit packed double-precision floating-point instructions.  |                 |
| 14H        | 01H         | ARITH.FPU_DIV_ACTIVE              | Cycles that the divider is active, includes INT and FP. Set 'edge =1, cmask=1' to count the number of divides.   |                 |
| 24H        | 01H         | L2_RQSTS.DEMAND_DATA_RD_HIT       | Demand Data Read requests that hit L2 cache.   |                 |
| 24H        | 03H         | L2_RQSTS.ALL_DEMAND_DATA_RD       | Counts any demand and L1 HW prefetch data load requests to L2.   |                 |
| 24H        | 04H         | L2_RQSTS.RFO_HITS                 | Counts the number of store RFO requests that hit the L2 cache.   |                 |
| 24H        | 08H         | L2_RQSTS.RFO_MISS                 | Counts the number of store RFO requests that miss the L2 cache.  |                 |
| 24H        | 0CH         | L2_RQSTS.ALL_RFO                  | Counts all L2 store RFO requests.  |                 |
| 24H        | 10H         | L2_RQSTS.CODE_RD_HIT              | Number of instruction fetches that hit the L2 cache.   |                 |
| 24H        | 20H         | L2_RQSTS.CODE_RD_MISS             | Number of instruction fetches that missed the L2 cache.  |                 |
| 24H        | 30H         | L2_RQSTS.ALL_CODE_RD              | Counts all L2 code requests.   |                 |
| 24H        | 40H         | L2_RQSTS.PF_HIT                   | Counts all L2 HW prefetcher requests that hit L2.  |                 |
| 24H        | 80H         | L2_RQSTS.PF_MISS                  | Counts all L2 HW prefetcher requests that missed L2.   |                 |
| 24H        | C0H         | L2_RQSTS.ALL_PF                   | Counts all L2 HW prefetcher requests.  |                 |
| 27H        | 01H         | L2_STORE_LOCK_RQSTS.MISS          | RFOs that miss cache lines.  |                 |
| 27H        | 08H         | L2_STORE_LOCK_RQSTS.HIT_M         | RFOs that hit cache lines in M state.  |                 |
| 27H        | 0FH         | L2_STORE_LOCK_RQSTS.ALL           | RFOs that access cache lines in any state.   |                 |
| 28H        | 01H         | L2_L1D_WB_RQSTS.MISS              | Not rejected writebacks that missed LLC.   |                 |
| 28H        | 04H         | L2_L1D_WB_RQSTS.HIT_E             | Not rejected writebacks from L1D to L2 cache lines in E state.   |                 |
| 28H        | 08H         | L2_L1D_WB_RQSTS.HIT_M             | Not rejected writebacks from L1D to L2 cache lines in M state.   |                 |
| 28H        | 0FH         | L2_L1D_WB_RQSTS.ALL               | Not rejected writebacks from L1D to L2 cache lines in any state.   |                 |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFERENCE       | This event counts requests originating from the core that reference a cache line in the last level cache.  | See Table 19-1  |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS            | This event counts each cache miss condition for references to the last level cache.  | See Table 19-1  |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P         | Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling. | See Table 19-1. |

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                             | Description   | Comment                                      |
|------------|-------------|---|---|--|
| 3CH        | 01H         | CPU_CLK_THREAD_UNHALTED.R<br>EF_XCLK            | Increments at the frequency of XCLK (100 MHz) when not halted.  | See Table 19-1.                              |
| 48H        | 01H         | L1D_PEND_MISS.PENDING                           | Increments the number of outstanding L1D misses every cycle. Set Cmask = 1 and Edge = 1 to count occurrences. | PMC2 only;<br>Set Cmask = 1 to count cycles. |
| 49H        | 01H         | DTLB_STORE_MISSES.MISS_CAUS<br>ES_A_WALK        | Miss in all TLB levels causes a page walk of any page size (4K/2M/4M/1G).                                     |  |
| 49H        | 02H         | DTLB_STORE_MISSES.WALK_CO<br>MPLETED            | Miss in all TLB levels causes a page walk that completes of any page size (4K/2M/4M/1G).                      |  |
| 49H        | 04H         | DTLB_STORE_MISSES.WALK_DUR<br>ATION             | Cycles PMH is busy with this walk.  |  |
| 49H        | 10H         | DTLB_STORE_MISSES.STLB_HIT                      | Store operations that miss the first TLB level but hit the second and do not cause page walks.                |  |
| 4CH        | 01H         | LOAD_HIT_PRE.SW_PF                              | Non-SW-prefetch load dispatches that hit fill buffer allocated for S/W prefetch.                              |  |
| 4CH        | 02H         | LOAD_HIT_PRE.HW_PF                              | Non-SW-prefetch load dispatches that hit fill buffer allocated for H/W prefetch.                              |  |
| 51H        | 01H         | L1D.REPLACEMENT                                 | Counts the number of lines brought into the L1 data cache.  |  |
| 58H        | 04H         | MOVE_ELIMINATION.INT_NOT_EL<br>IMINATED         | Number of integer Move Elimination candidate uops that were not eliminated.                                   |  |
| 58H        | 08H         | MOVE_ELIMINATION.SIMD_NOT_E<br>LIMINATED        | Number of SIMD Move Elimination candidate uops that were not eliminated.                                      |  |
| 58H        | 01H         | MOVE_ELIMINATION.INT_ELIMINA<br>TED             | Number of integer Move Elimination candidate uops that were eliminated.                                       |  |
| 58H        | 02H         | MOVE_ELIMINATION.SIMD_ELIMIN<br>ATED            | Number of SIMD Move Elimination candidate uops that were eliminated.  |  |
| 5CH        | 01H         | CPL_CYCLES.RING0                                | Unhalted core cycles when the thread is in ring 0.  | Use Edge to count transition.                |
| 5CH        | 02H         | CPL_CYCLES.RING123                              | Unhalted core cycles when the thread is not in ring 0.  |  |
| 5EH        | 01H         | RS_EVENTS.EMPTY_CYCLES                          | Cycles the RS is empty for the thread.  |  |
| 5FH        | 04H         | DTLB_LOAD_MISSES.STLB_HIT                       | Counts load operations that missed 1st level DTLB but hit the 2nd level.                                      |  |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTAN<br>DING.DEMAND_DATA_RD | Offcore outstanding Demand Data Read transactions in SQ to uncore. Set Cmask=1 to count cycles.               |  |
| 60H        | 02H         | OFFCORE_REQUESTS_OUTSTAN<br>DING.DEMAND_CODE_RD | Offcore outstanding Demand Code Read transactions in SQ to uncore. Set Cmask=1 to count cycles.               |  |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTAN<br>DING.DEMAND_RFO     | Offcore outstanding RFO store transactions in SQ to uncore. Set Cmask=1 to count cycles.                      |  |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTAN<br>DING.ALL_DATA_RD    | Offcore outstanding cacheable data read transactions in SQ to uncore. Set Cmask=1 to count cycles.            |  |
| 63H        | 01H         | LOCK_CYCLES.SPLIT_LOCK_UC_L<br>OCK_DURATION     | Cycles in which the L1D and L2 are locked, due to a UC lock or split lock.                                    |  |

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description  | Comment                           |
|------------|-------------|--|--|-----------------------------------|
| 63H        | 02H         | LOCK_CYCLES.CACHE_LOCK_DURATION        | Cycles in which the L1D is locked.   |                                   |
| 79H        | 02H         | IDQ.EMPTY                              | Counts cycles the IDQ is empty.  |                                   |
| 79H        | 04H         | IDQ.MITE_UOPS                          | Increment each cycle # of uops delivered to IDQ from MITE path. Set Cmask = 1 to count cycles.   | Can combine Umask 04H and 20H.    |
| 79H        | 08H         | IDQ.DSB_UOPS                           | Increment each cycle. # of uops delivered to IDQ from DSB path. Set Cmask = 1 to count cycles.   | Can combine Umask 08H and 10H.    |
| 79H        | 10H         | IDQ.MS_DSB_UOPS                        | Increment each cycle # of uops delivered to IDQ when MS_busy by DSB. Set Cmask = 1 to count cycles. Add Edge=1 to count # of delivery. | Can combine Umask 04H, 08H.       |
| 79H        | 20H         | IDQ.MS_MITE_UOPS                       | Increment each cycle # of uops delivered to IDQ when MS_busy by MITE. Set Cmask = 1 to count cycles.                                   | Can combine Umask 04H, 08H.       |
| 79H        | 30H         | IDQ.MS_UOPS                            | Increment each cycle # of uops delivered to IDQ from MS by either DSB or MITE. Set Cmask = 1 to count cycles.                          | Can combine Umask 04H, 08H.       |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_ANY_UOPS            | Counts cycles DSB is delivered at least one uops. Set Cmask = 1.   |                                   |
| 79H        | 18H         | IDQ.ALL_DSB_CYCLES_4_UOPS              | Counts cycles DSB is delivered four uops. Set Cmask = 4.   |                                   |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_ANY_UOPS           | Counts cycles MITE is delivered at least one uops. Set Cmask = 1.  |                                   |
| 79H        | 24H         | IDQ.ALL_MITE_CYCLES_4_UOPS             | Counts cycles MITE is delivered four uops. Set Cmask = 4.  |                                   |
| 79H        | 3CH         | IDQ.MITE_ALL_UOPS                      | # of uops delivered to IDQ from any path.  |                                   |
| 80H        | 04H         | ICACHE.IFETCH_STALL                    | Cycles where a code-fetch stalled due to L1 instruction-cache miss or an iTLB miss.  |                                   |
| 80H        | 02H         | ICACHE.MISSES                          | Number of Instruction Cache, Streaming Buffer and Victim Cache Misses. Includes UC accesses.   |                                   |
| 85H        | 01H         | ITLB_MISSES.MISS_CAUSES_A_WALK         | Misses in all ITLB levels that cause page walks.   |                                   |
| 85H        | 02H         | ITLB_MISSES.WALK_COMPLETED             | Misses in all ITLB levels that cause completed page walks.   |                                   |
| 85H        | 04H         | ITLB_MISSES.WALK_DURATION              | Cycle PMH is busy with a walk.   |                                   |
| 85H        | 10H         | ITLB_MISSES.STLB_HIT                   | Number of cache load STLB hits. No page walk.  |                                   |
| 87H        | 01H         | ILD_STALL.LCP                          | Stalls caused by changing prefix length of the instruction.  |                                   |
| 87H        | 04H         | ILD_STALL.IQ_FULL                      | Stall cycles due to IQ is full.  |                                   |
| 88H        | 01H         | BR_INST_EXEC.COND                      | Qualify conditional near branch instructions executed, but not necessarily retired.  | Must combine with umask 40H, 80H. |
| 88H        | 02H         | BR_INST_EXEC.DIRECT_JMP                | Qualify all unconditional near branch instructions excluding calls and indirect branches.  | Must combine with umask 80H.      |
| 88H        | 04H         | BR_INST_EXEC.INDIRECT_JMP_NON_CALL_RET | Qualify executed indirect near branch instructions that are not calls or returns.  | Must combine with umask 80H.      |
| 88H        | 08H         | BR_INST_EXEC.RETURN_NEAR               | Qualify indirect near branches that have a return mnemonic.  | Must combine with umask 80H.      |

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description   | Comment                           |
|------------|-------------|--|---|-----------------------------------|
| 88H        | 10H         | BR_INST_EXEC.DIRECT_NEAR_CALL          | Qualify unconditional near call branch instructions, excluding non-call branch, executed.                                 | Must combine with umask 80H.      |
| 88H        | 20H         | BR_INST_EXEC.INDIRECT_NEAR_CALL        | Qualify indirect near calls, including both register and memory indirect, executed.                                       | Must combine with umask 80H.      |
| 88H        | 40H         | BR_INST_EXEC.NONTAKEN                  | Qualify non-taken near branches executed.   | Applicable to umask 01H only.     |
| 88H        | 80H         | BR_INST_EXEC.TAKEN                     | Qualify taken near branches executed. Must combine with 01H, 02H, 04H, 08H, 10H, 20H.                                     |                                   |
| 88H        | FFH         | BR_INST_EXEC.ALL_BRANCHES              | Counts all near executed branches (not necessarily retired).  |                                   |
| 89H        | 01H         | BR_MISP_EXEC.COND                      | Qualify conditional near branch instructions mispredicted.  | Must combine with umask 40H, 80H. |
| 89H        | 04H         | BR_MISP_EXEC.INDIRECT_JMP_NON_CALL_RET | Qualify mispredicted indirect near branch instructions that are not calls or returns.                                     | Must combine with umask 80H.      |
| 89H        | 08H         | BR_MISP_EXEC.RETURN_NEAR               | Qualify mispredicted indirect near branches that have a return mnemonic.  | Must combine with umask 80H.      |
| 89H        | 10H         | BR_MISP_EXEC.DIRECT_NEAR_CALL          | Qualify mispredicted unconditional near call branch instructions, excluding non-call branch, executed.                    | Must combine with umask 80H.      |
| 89H        | 20H         | BR_MISP_EXEC.INDIRECT_NEAR_CALL        | Qualify mispredicted indirect near calls, including both register and memory indirect, executed.                          | Must combine with umask 80H.      |
| 89H        | 40H         | BR_MISP_EXEC.NONTAKEN                  | Qualify mispredicted non-taken near branches executed.  | Applicable to umask 01H only.     |
| 89H        | 80H         | BR_MISP_EXEC.TAKEN                     | Qualify mispredicted taken near branches executed. Must combine with 01H, 02H, 04H, 08H, 10H, 20H.                        |                                   |
| 89H        | FFH         | BR_MISP_EXEC.ALL_BRANCHES              | Counts all near executed branches (not necessarily retired).  |                                   |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CORE            | Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back-end stall. | Use Cmask to qualify uop b/w.     |
| A1H        | 01H         | UOPS_DISPATCHED_PORT.PORT_0            | Cycles which a Uop is dispatched on port 0.   |                                   |
| A1H        | 02H         | UOPS_DISPATCHED_PORT.PORT_1            | Cycles which a Uop is dispatched on port 1.   |                                   |
| A1H        | 0CH         | UOPS_DISPATCHED_PORT.PORT_2            | Cycles which a Uop is dispatched on port 2.   |                                   |
| A1H        | 30H         | UOPS_DISPATCHED_PORT.PORT_3            | Cycles which a Uop is dispatched on port 3.   |                                   |
| A1H        | 40H         | UOPS_DISPATCHED_PORT.PORT_4            | Cycles which a Uop is dispatched on port 4.   |                                   |
| A1H        | 80H         | UOPS_DISPATCHED_PORT.PORT_5            | Cycles which a Uop is dispatched on port 5.   |                                   |
| A2H        | 01H         | RESOURCE_STALLS.ANY                    | Cycles Allocation is stalled due to Resource Related reason.  |                                   |
| A2H        | 04H         | RESOURCE_STALLS.RS                     | Cycles stalled due to no eligible RS entry available.   |                                   |
| A2H        | 08H         | RESOURCE_STALLS.SB                     | Cycles stalled due to no store buffers available (not including draining from sync).                                      |                                   |
| A2H        | 10H         | RESOURCE_STALLS.ROB                    | Cycles stalled due to re-order buffer full.   |                                   |

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic               | Description  | Comment  |
|------------|-------------|-----------------------------------|--|--|
| A3H        | 01H         | CYCLE_ACTIVITY.CYCLES_L2_PENDING  | Cycles with pending L2 miss loads. Set AnyThread to count per core.  |  |
| A3H        | 02H         | CYCLE_ACTIVITY.CYCLES_LDM_PENDING | Cycles with pending memory loads. Set AnyThread to count per core.   | Restricted to counters 0-3 when HTT is disabled. |
| A3H        | 04H         | CYCLE_ACTIVITY.CYCLES_NO_EXECUTE  | Cycles of dispatch stalls. Set AnyThread to count per core.  | Restricted to counters 0-3 when HTT is disabled. |
| A3H        | 05H         | CYCLE_ACTIVITY.STALLS_L2_PENDING  | Number of loads missed L2.   | Restricted to counters 0-3 when HTT is disabled. |
| A3H        | 06H         | CYCLE_ACTIVITY.STALLS_LDM_PENDING |  | Restricted to counters 0-3 when HTT is disabled. |
| A3H        | 08H         | CYCLE_ACTIVITY.CYCLES_L1D_PENDING | Cycles with pending L1 cache miss loads. Set AnyThread to count per core.                                      | PMC2 only.                                       |
| A3H        | 0CH         | CYCLE_ACTIVITY.STALLS_L1D_PENDING | Execution stalls due to L1 data cache miss loads. Set Cmask=0CH.   | PMC2 only.                                       |
| A8H        | 01H         | LSD.UOPS                          | Number of Uops delivered by the LSD.   |  |
| ABH        | 01H         | DSB2MITE_SWITCHES.COUNT           | Number of DSB to MITE switches.  |  |
| ABH        | 02H         | DSB2MITE_SWITCHES.PENALTY_CYCLES  | Cycles DSB to MITE switches caused delay.  |  |
| ACH        | 08H         | DSB_FILL.EXCEED_DSB_LINES         | DSB Fill encountered > 3 DSB lines.  |  |
| AEH        | 01H         | ITLB.ITLB_FLUSH                   | Counts the number of ITLB flushes, includes 4k/2M/4M pages.  |  |
| BOH        | 01H         | OFFCORE_REQUESTS.DEMAND_DATA_RD   | Demand data read requests sent to uncore.  |  |
| BOH        | 02H         | OFFCORE_REQUESTS.DEMAND_CODE_RD   | Demand code read requests sent to uncore.  |  |
| BOH        | 04H         | OFFCORE_REQUESTS.DEMAND_RFO       | Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.                                  |  |
| BOH        | 08H         | OFFCORE_REQUESTS.ALL_DATA_RD      | Data read requests sent to uncore (demand and prefetch).   |  |
| B1H        | 01H         | UOPS_EXECUTED.THREAD              | Counts total number of uops to be executed per-thread each cycle. Set Cmask = 1, INV =1 to count stall cycles. |  |
| B1H        | 02H         | UOPS_EXECUTED.CORE                | Counts total number of uops to be executed per-core each cycle.  | Do not need to set ANY.                          |
| B7H        | 01H         | OFFCORE_RESPONSE_0                | See Section 18.3.4.5, "Off-core Response Performance Monitoring".  | Requires MSR 01A6H.                              |
| BBH        | 01H         | OFFCORE_RESPONSE_1                | See Section 18.3.4.5, "Off-core Response Performance Monitoring".  | Requires MSR 01A7H.                              |
| BDH        | 01H         | TLB_FLUSH.DTLB_THREAD             | DTLB flush attempts of the thread-specific entries.  |  |
| BDH        | 20H         | TLB_FLUSH.STLB_ANY                | Count number of STLB flush attempts.   |  |
| COH        | 00H         | INST_RETIRED.ANY_P                | Number of instructions at retirement.  | See Table 19-1.                                  |
| COH        | 01H         | INST_RETIRED.PREC_DIST            | Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.                  | PMC1 only.                                       |
| C1H        | 08H         | OTHER_ASSISTS.AVX_STORE           | Number of assists associated with 256-bit AVX store operations.  |  |

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description  | Comment                                     |
|------------|-------------|--------------------------------|--|---|
| C1H        | 10H         | OTHER_ASSISTS.AVX_TO_SSE       | Number of transitions from AVX-256 to legacy SSE when penalty applicable.  |   |
| C1H        | 20H         | OTHER_ASSISTS.SSE_TO_AVX       | Number of transitions from SSE to AVX-256 when penalty applicable.   |   |
| C1H        | 80H         | OTHER_ASSISTS.WB               | Number of times microcode assist is invoked by hardware upon uop writeback.  |   |
| C2H        | 01H         | UOPS_RETIRED.ALL               | Counts the number of micro-ops retired, Use cmask=1 and invert to count active cycles or stalled cycles.                     | Supports PEBS, use Any=1 for core granular. |
| C2H        | 02H         | UOPS_RETIRED.RETIRE_SLOTS      | Counts the number of retirement slots used each cycle.   | Supports PEBS.                              |
| C3H        | 02H         | MACHINE_CLEARS.MEMORY_ORDERING | Counts the number of machine clears due to memory order conflicts.   |   |
| C3H        | 04H         | MACHINE_CLEARS.SMC             | Number of self-modifying-code machine clears detected.   |   |
| C3H        | 20H         | MACHINE_CLEARS.MASKMOV         | Counts the number of executed AVX masked load operations that refer to an illegal address range with the mask bits set to 0. |   |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES   | Branch instructions at retirement.   | See Table 19-1.                             |
| C4H        | 01H         | BR_INST_RETIRED.CONDITIONAL    | Counts the number of conditional branch instructions retired.  | Supports PEBS.                              |
| C4H        | 02H         | BR_INST_RETIRED.NEAR_CALL      | Direct and indirect near call instructions retired.  | Supports PEBS.                              |
| C4H        | 04H         | BR_INST_RETIRED.ALL_BRANCHES   | Counts the number of branch instructions retired.  | Supports PEBS.                              |
| C4H        | 08H         | BR_INST_RETIRED.NEAR_RETURN    | Counts the number of near return instructions retired.   | Supports PEBS.                              |
| C4H        | 10H         | BR_INST_RETIRED.NOT_TAKEN      | Counts the number of not taken branch instructions retired.  | Supports PEBS.                              |
| C4H        | 20H         | BR_INST_RETIRED.NEAR_TAKEN     | Number of near taken branches retired.   | Supports PEBS.                              |
| C4H        | 40H         | BR_INST_RETIRED.FAR_BRANCH     | Number of far branches retired.  | Supports PEBS.                              |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANCHES   | Mispredicted branch instructions at retirement.  | See Table 19-1.                             |
| C5H        | 01H         | BR_MISP_RETIRED.CONDITIONAL    | Mispredicted conditional branch instructions retired.  | Supports PEBS.                              |
| C5H        | 04H         | BR_MISP_RETIRED.ALL_BRANCHES   | Mispredicted macro branch instructions retired.  | Supports PEBS.                              |
| C5H        | 20H         | BR_MISP_RETIRED.NEAR_TAKEN     | Mispredicted taken branch instructions retired.  | Supports PEBS.                              |
| CAH        | 02H         | FP_ASSIST.X87_OUTPUT           | Number of X87 FP assists due to output values.   | Supports PEBS.                              |
| CAH        | 04H         | FP_ASSIST.X87_INPUT            | Number of X87 FP assists due to input values.  | Supports PEBS.                              |
| CAH        | 08H         | FP_ASSIST.SIMD_OUTPUT          | Number of SIMD FP assists due to output values.  | Supports PEBS.                              |
| CAH        | 10H         | FP_ASSIST.SIMD_INPUT           | Number of SIMD FP assists due to input values.   |   |
| CAH        | 1EH         | FP_ASSIST.ANY                  | Cycles with any input/output SSE* or FP assists.   |   |
| CCH        | 20H         | ROB_MISC_EVENTS.LBR_INSERTS    | Count cases of saving new LBR records by hardware.   |   |

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                       | Description   | Comment   |
|------------|-------------|---|---|---|
| CDH        | 01H         | MEM_TRANS_RETIRED.LOAD_LATENCY            | Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization. | Specify threshold in MSR 3F6H. PMC 3 only.                      |
| CDH        | 02H         | MEM_TRANS_RETIRED.PRECISE_STORE           | Sample stores and collect precise store operation via PEBS record. PMC3 only.   | See Section 18.3.4.4.3.   |
| D0H        | 11H         | MEM_UOPS_RETIRED.STLB_MISS_LOADS          | Retired load uops that miss the STLB.   | Supports PEBS.  |
| D0H        | 12H         | MEM_UOPS_RETIRED.STLB_MISS_STORES         | Retired store uops that miss the STLB.  | Supports PEBS.  |
| D0H        | 21H         | MEM_UOPS_RETIRED.LOCK_LOADS               | Retired load uops with locked access.   | Supports PEBS.  |
| D0H        | 41H         | MEM_UOPS_RETIRED.SPLIT_LOADS              | Retired load uops that split across a cacheline boundary.   | Supports PEBS.  |
| D0H        | 42H         | MEM_UOPS_RETIRED.SPLIT_STORES             | Retired store uops that split across a cacheline boundary.  | Supports PEBS.  |
| D0H        | 81H         | MEM_UOPS_RETIRED.ALL_LOADS                | All retired load uops.  | Supports PEBS.  |
| D0H        | 82H         | MEM_UOPS_RETIRED.ALL_STORES               | All retired store uops.   | Supports PEBS.  |
| D1H        | 01H         | MEM_LOAD_UOPS_RETIRED.L1_HIT              | Retired load uops with L1 cache hits as data sources.   | Supports PEBS.  |
| D1H        | 02H         | MEM_LOAD_UOPS_RETIRED.L2_HIT              | Retired load uops with L2 cache hits as data sources.   | Supports PEBS.  |
| D1H        | 04H         | MEM_LOAD_UOPS_RETIRED.LLC_HIT             | Retired load uops whose data source was LLC hit with no snoop required.   | Supports PEBS.  |
| D1H        | 08H         | MEM_LOAD_UOPS_RETIRED.L1_MISS             | Retired load uops whose data source followed an L1 miss.  | Supports PEBS.  |
| D1H        | 10H         | MEM_LOAD_UOPS_RETIRED.L2_MISS             | Retired load uops that missed L2, excluding unknown sources.  | Supports PEBS.  |
| D1H        | 20H         | MEM_LOAD_UOPS_RETIRED.LLC_MISS            | Retired load uops whose data source is LLC miss.  | Supports PEBS. Restricted to counters 0-3 when HTT is disabled. |
| D1H        | 40H         | MEM_LOAD_UOPS_RETIRED.HIT_LFB             | Retired load uops which data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready.      | Supports PEBS.  |
| D2H        | 01H         | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_MISS   | Retired load uops whose data source was an on-package core cache LLC hit and cross-core snoop missed.   | Supports PEBS.  |
| D2H        | 02H         | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HIT    | Retired load uops whose data source was an on-package LLC hit and cross-core snoop hits.  | Supports PEBS.  |
| D2H        | 04H         | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HITM   | Retired load uops whose data source was an on-package core cache with HitM responses.   | Supports PEBS.  |
| D2H        | 08H         | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_NONE   | Retired load uops whose data source was LLC hit with no snoop required.   | Supports PEBS.  |
| D3H        | 01H         | MEM_LOAD_UOPS_LLC_MISS_RETIRED.LOCAL_DRAM | Retired load uops whose data source was local memory (cross-socket snoop not needed or missed).   | Supports PEBS.  |
| E6H        | 1FH         | BACLEARS.ANY                              | Number of front end re-steers due to BPU misprediction.   |   |

**Table 19-13. Performance Events In the Processor Core of 3rd Generation Intel® Core™ i7, i5, i3 Processors (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic       | Description   | Comment                          |
|------------|-------------|---------------------------|---|----------------------------------|
| F0H        | 01H         | L2_TRANS.DEMAND_DATA_RD   | Demand Data Read requests that access L2 cache.             |                                  |
| F0H        | 02H         | L2_TRANS.RFO              | RFO requests that access L2 cache.                          |                                  |
| F0H        | 04H         | L2_TRANS.CODE_RD          | L2 cache accesses when fetching instructions.               |                                  |
| F0H        | 08H         | L2_TRANS.ALL_PF           | Any MLC or LLC HW prefetch accessing L2, including rejects. |                                  |
| F0H        | 10H         | L2_TRANS.L1D_WB           | L1D writebacks that access L2 cache.                        |                                  |
| F0H        | 20H         | L2_TRANS.L2_FILL          | L2 fill requests that access L2 cache.                      |                                  |
| F0H        | 40H         | L2_TRANS.L2_WB            | L2 writebacks that access L2 cache.                         |                                  |
| F0H        | 80H         | L2_TRANS.ALL_REQUESTS     | Transactions accessing L2 pipe.                             |                                  |
| F1H        | 01H         | L2_LINES_IN.I             | L2 cache lines in I state filling L2.                       | Counting does not cover rejects. |
| F1H        | 02H         | L2_LINES_IN.S             | L2 cache lines in S state filling L2.                       | Counting does not cover rejects. |
| F1H        | 04H         | L2_LINES_IN.E             | L2 cache lines in E state filling L2.                       | Counting does not cover rejects. |
| F1H        | 07H         | L2_LINES_IN.ALL           | L2 cache lines filling L2.                                  | Counting does not cover rejects. |
| F2H        | 01H         | L2_LINES_OUT.DEMAND_CLEAN | Clean L2 cache lines evicted by demand.                     |                                  |
| F2H        | 02H         | L2_LINES_OUT.DEMAND_DIRTY | Dirty L2 cache lines evicted by demand.                     |                                  |
| F2H        | 04H         | L2_LINES_OUT.PF_CLEAN     | Clean L2 cache lines evicted by the MLC prefetcher.         |                                  |
| F2H        | 08H         | L2_LINES_OUT.PF_DIRTY     | Dirty L2 cache lines evicted by the MLC prefetcher.         |                                  |
| F2H        | 0AH         | L2_LINES_OUT.DIRTY_ALL    | Dirty L2 cache lines filling the L2.                        | Counting does not cover rejects. |

### 19.7.1 Performance Monitoring Events in the Processor Core of Intel Xeon Processor E5 v2 Family and Intel Xeon Processor E7 v2 Family

Model-specific performance monitoring events in the processor core that are applicable only to Intel Xeon processor E5 v2 family and Intel Xeon processor E7 v2 family based on the Ivy Bridge-E microarchitecture, with CPUID signature of DisplayFamily\_DisplayModel 06\_3EH, are listed in Table 19-14.

**Table 19-14. Performance Events Applicable Only to the Processor Core of Intel® Xeon® Processor E5 v2 Family and Intel® Xeon® Processor E7 v2 Family**

| Event Num. | Umask Value | Event Mask Mnemonic                        | Description   | Comment        |
|------------|-------------|--|---|----------------|
| D3H        | 03H         | MEM_LOAD_UOPS_LLC_MISS_RETIRED.LOCAL_DRAM  | Retired load uops whose data sources were local DRAM (snoop not needed, Snoop Miss, or Snoop Hit data not forwarded). | Supports PEBS. |
| D3H        | 0CH         | MEM_LOAD_UOPS_LLC_MISS_RETIRED.REMOTE_DRAM | Retired load uops whose data source was remote DRAM (snoop not needed, Snoop Miss, or Snoop Hit data not forwarded).  | Supports PEBS. |
| D3H        | 10H         | MEM_LOAD_UOPS_LLC_MISS_RETIRED.REMOTE_HITM | Retired load uops whose data sources were remote HITM.  | Supports PEBS. |
| D3H        | 20H         | MEM_LOAD_UOPS_LLC_MISS_RETIRED.REMOTE_FWD  | Retired load uops whose data sources were forwards from a remote cache.   | Supports PEBS. |

## 19.8 PERFORMANCE MONITORING EVENTS FOR 2ND GENERATION INTEL® CORE™ I7-2XXX, INTEL® CORE™ I5-2XXX, INTEL® CORE™ I3-2XXX PROCESSOR SERIES

2nd generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx processor series, and Intel Xeon processor E3-1200 product family are based on the Intel microarchitecture code name Sandy Bridge. They support architectural performance monitoring events listed in Table 19-1. Model-specific performance monitoring events in the processor core are listed in Table 19-15, Table 19-16, and Table 19-17. The events in Table 19-15 apply to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following values: 06\_2AH and 06\_2DH. The events in Table 19-16 apply to processors with CPUID signature 06\_2AH. The events in Table 19-17 apply to processors with CPUID signature 06\_2DH. Fixed counters in the core PMU support the architecture events defined in Table 19-2.

Additional information on event specifics (e.g. derivative events using specific IA32\_PERFECTSELx modifiers, limitations, special notes and recommendations) can be found at <https://software.intel.com/en-us/forums/software-tuning-performance-optimization-platform-monitoring>.

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family**

| Event Num. | Umask Value | Event Mask Mnemonic                 | Description   | Comment                        |
|------------|-------------|-------------------------------------|---|--------------------------------|
| 03H        | 01H         | LD_BLOCKS.DATA_UNKNOWN              | Blocked loads due to store buffer blocks with unknown data.   |                                |
| 03H        | 02H         | LD_BLOCKS.STORE_FORWARD             | Loads blocked by overlapping with store buffer that cannot be forwarded.  |                                |
| 03H        | 08H         | LD_BLOCKS.NO_SR                     | # of Split loads blocked due to resource not available.   |                                |
| 03H        | 10H         | LD_BLOCKS.ALL_BLOCK                 | Number of cases where any load is blocked but has no DCU miss.  |                                |
| 05H        | 01H         | MISALIGN_MEM_REF.LOADS              | Speculative cache-line split load uops dispatched to L1D.   |                                |
| 05H        | 02H         | MISALIGN_MEM_REF.STORES             | Speculative cache-line split Store-address uops dispatched to L1D.  |                                |
| 07H        | 01H         | LD_BLOCKS_PARTIAL.ADDRESS_ALIAS     | False dependencies in MOB due to partial compare on address.  |                                |
| 07H        | 08H         | LD_BLOCKS_PARTIAL.ALL_STORE_BLOCK   | The number of times that load operations are temporarily blocked because of older stores, with addresses that are not yet known. A load operation may incur more than one block of this type. |                                |
| 08H        | 01H         | DTLB_LOAD_MISSES.MISS_CAUSES_A_WALK | Misses in all TLB levels that cause a page walk of any page size.   |                                |
| 08H        | 02H         | DTLB_LOAD_MISSES.WALK_COMPLETED     | Misses in all TLB levels that caused page walk completed of any size.   |                                |
| 08H        | 04H         | DTLB_LOAD_MISSES.WALK_DURATION      | Cycle PMH is busy with a walk.  |                                |
| 08H        | 10H         | DTLB_LOAD_MISSES.STLB_HIT           | Number of cache load STLB hits. No page walk.   |                                |
| 0DH        | 03H         | INT_MISC.RECOVERY_CYCLES            | Cycles waiting to recover after Machine Clears or JEClear. Set Cmask= 1.  | Set Edge to count occurrences. |
| 0DH        | 40H         | INT_MISC.RAT_STALL_CYCLES           | Cycles RAT external stall is sent to IDQ for this thread.   |                                |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                  | Description   | Comment   |
|------------|-------------|--------------------------------------|---|---|
| 0EH        | 01H         | UOPS_ISSUED.ANY                      | Increments each cycle the # of Uops issued by the RAT to RS. Set Cmask = 1, Inv = 1, Any= 1 to count stalled cycles of this core. | Set Cmask = 1, Inv = 1 to count stalled cycles. |
| 10H        | 01H         | FP_COMP_OPS_EXE.X87                  | Counts number of X87 uops executed.   |   |
| 10H        | 10H         | FP_COMP_OPS_EXE.SSE_FP_PACKED_DOUBLE | Counts number of SSE* double precision FP packed uops executed.   |   |
| 10H        | 20H         | FP_COMP_OPS_EXE.SSE_FP_SCALAR_SINGLE | Counts number of SSE* single precision FP scalar uops executed.   |   |
| 10H        | 40H         | FP_COMP_OPS_EXE.SSE_PACKED_SINGLE    | Counts number of SSE* single precision FP packed uops executed.   |   |
| 10H        | 80H         | FP_COMP_OPS_EXE.SSE_SCALAR_DOUBLE    | Counts number of SSE* double precision FP scalar uops executed.   |   |
| 11H        | 01H         | SIMD_FP_256.PACKED_SINGLE            | Counts 256-bit packed single-precision floating-point instructions.   |   |
| 11H        | 02H         | SIMD_FP_256.PACKED_DOUBLE            | Counts 256-bit packed double-precision floating-point instructions.   |   |
| 14H        | 01H         | ARITH.FPU_DIV_ACTIVE                 | Cycles that the divider is active, includes INT and FP. Set 'edge =1, cmask=1' to count the number of divides.                    |   |
| 17H        | 01H         | INSTS_WRITTEN_TO_IQ.INSTS            | Counts the number of instructions written into the IQ every cycle.  |   |
| 24H        | 01H         | L2_RQSTS.DEMAND_DATA_READ_HIT        | Demand Data Read requests that hit L2 cache.  |   |
| 24H        | 03H         | L2_RQSTS.ALL_DEMAND_DATA_READ        | Counts any demand and L1 HW prefetch data load requests to L2.  |   |
| 24H        | 04H         | L2_RQSTS.RFO_HITS                    | Counts the number of store RFO requests that hit the L2 cache.  |   |
| 24H        | 08H         | L2_RQSTS.RFO_MISS                    | Counts the number of store RFO requests that miss the L2 cache.   |   |
| 24H        | 0CH         | L2_RQSTS.ALL_RFO                     | Counts all L2 store RFO requests.   |   |
| 24H        | 10H         | L2_RQSTS.CODE_READ_HIT               | Number of instruction fetches that hit the L2 cache.  |   |
| 24H        | 20H         | L2_RQSTS.CODE_READ_MISS              | Number of instruction fetches that missed the L2 cache.   |   |
| 24H        | 30H         | L2_RQSTS.ALL_CODE_READ               | Counts all L2 code requests.  |   |
| 24H        | 40H         | L2_RQSTS.PF_HIT                      | Requests from L2 Hardware prefetcher that hit L2.   |   |
| 24H        | 80H         | L2_RQSTS.PF_MISS                     | Requests from L2 Hardware prefetcher that missed L2.  |   |
| 24H        | COH         | L2_RQSTS.ALL_PF                      | Any requests from L2 Hardware prefetchers.  |   |
| 27H        | 01H         | L2_STORE_LOCK_RQSTS.MISS             | RFOs that miss cache lines.   |   |
| 27H        | 04H         | L2_STORE_LOCK_RQSTS.HIT_E            | RFOs that hit cache lines in E state.   |   |
| 27H        | 08H         | L2_STORE_LOCK_RQSTS.HIT_M            | RFOs that hit cache lines in M state.   |   |
| 27H        | 0FH         | L2_STORE_LOCK_RQSTS.ALL              | RFOs that access cache lines in any state.  |   |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                  | Description  | Comment   |
|------------|-------------|--------------------------------------|--|---|
| 28H        | 01H         | L2_L1D_WB_RQSTS.MISS                 | Not rejected writebacks from L1D to L2 cache lines that missed L2.   |   |
| 28H        | 02H         | L2_L1D_WB_RQSTS.HIT_S                | Not rejected writebacks from L1D to L2 cache lines in S state.   |   |
| 28H        | 04H         | L2_L1D_WB_RQSTS.HIT_E                | Not rejected writebacks from L1D to L2 cache lines in E state.   |   |
| 28H        | 08H         | L2_L1D_WB_RQSTS.HIT_M                | Not rejected writebacks from L1D to L2 cache lines in M state.   |   |
| 28H        | 0FH         | L2_L1D_WB_RQSTS.ALL                  | Not rejected writebacks from L1D to L2 cache.  |   |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFERENCE          | This event counts requests originating from the core that reference a cache line in the last level cache.  | See Table 19-1.   |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS               | This event counts each cache miss condition for references to the last level cache.  | See Table 19-1.   |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P            | Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling. | See Table 19-1.   |
| 3CH        | 01H         | CPU_CLK_THREAD_UNHALTED.REF_XCLK     | Increments at the frequency of XCLK (100 MHz) when not halted.   | See Table 19-1.   |
| 48H        | 01H         | L1D_PEND_MISS.PENDING                | Increments the number of outstanding L1D misses every cycle. Set Cmask = 1 and Edge = 1 to count occurrences.  | PMC2 only;<br>Set Cmask = 1 to count cycles.                          |
| 49H        | 01H         | DTLB_STORE_MISSES.MISS_CAUSES_A_WALK | Miss in all TLB levels causes a page walk of any page size (4K/2M/4M/1G).  |   |
| 49H        | 02H         | DTLB_STORE_MISSES.WALK_COMPLETED     | Miss in all TLB levels causes a page walk that completes of any page size (4K/2M/4M/1G).   |   |
| 49H        | 04H         | DTLB_STORE_MISSES.WALK_DURATION      | Cycles PMH is busy with this walk.   |   |
| 49H        | 10H         | DTLB_STORE_MISSES.STLB_HIT           | Store operations that miss the first TLB level but hit the second and do not cause page walks.   |   |
| 4CH        | 01H         | LOAD_HIT_PRE.SW_PF                   | Not SW-prefetch load dispatches that hit fill buffer allocated for S/W prefetch.   |   |
| 4CH        | 02H         | LOAD_HIT_PRE.HW_PF                   | Not SW-prefetch load dispatches that hit fill buffer allocated for H/W prefetch.   |   |
| 4EH        | 02H         | HW_PRE_REQ.DL1_MISS                  | Hardware Prefetch requests that miss the L1D cache. A request is being counted each time it access the cache & miss it, including if a block is applicable or if hit the Fill Buffer for example.  | This accounts for both L1 streamer and IP-based (IPP) HW prefetchers. |
| 51H        | 01H         | L1D.REPLACEMENT                      | Counts the number of lines brought into the L1 data cache.   |   |
| 51H        | 02H         | L1D.ALLOCATED_IN_M                   | Counts the number of allocations of modified L1D cache lines.  |   |
| 51H        | 04H         | L1D.EVICTION                         | Counts the number of modified lines evicted from the L1 data cache due to replacement.   |   |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                         | Description   | Comment                        |
|------------|-------------|---|---|--------------------------------|
| 51H        | 08H         | L1D.ALL_M_REPLACEMENT                       | Cache lines in M state evicted out of L1D due to Snoop HitM or dirty line replacement.  |                                |
| 59H        | 20H         | PARTIAL_RAT_STALLS.FLAGS_MERGE_UOP          | Increments the number of flags-merge uops in flight each cycle. Set Cmask = 1 to count cycles.  |                                |
| 59H        | 40H         | PARTIAL_RAT_STALLS.SLOW_LEA_WINDOW          | Cycles with at least one slow LEA uop allocated.  |                                |
| 59H        | 80H         | PARTIAL_RAT_STALLS.MUL_SINGLE_UOP           | Number of Multiply packed/scalar single precision uops allocated.   |                                |
| 5BH        | 0CH         | RESOURCE_STALLS2.ALL_FL_EMPTY               | Cycles stalled due to free list empty.  | PMCO-3 only regardless HTT.    |
| 5BH        | 0FH         | RESOURCE_STALLS2.ALL_PRF_CONTROL            | Cycles stalled due to control structures full for physical registers.   |                                |
| 5BH        | 40H         | RESOURCE_STALLS2.BOB_FULL                   | Cycles Allocator is stalled due Branch Order Buffer.  |                                |
| 5BH        | 4FH         | RESOURCE_STALLS2.OOO_RESOURCE               | Cycles stalled due to out of order resources full.  |                                |
| 5CH        | 01H         | CPL_CYCLES.RING0                            | Unhalted core cycles when the thread is in ring 0.  | Use Edge to count transition.  |
| 5CH        | 02H         | CPL_CYCLES.RING123                          | Unhalted core cycles when the thread is not in ring 0.  |                                |
| 5EH        | 01H         | RS_EVENTS.EMPTY_CYCLES                      | Cycles the RS is empty for the thread.  |                                |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_DATA_RD | Offcore outstanding Demand Data Read transactions in SQ to uncore. Set Cmask=1 to count cycles.   |                                |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND_RFO     | Offcore outstanding RFO store transactions in SQ to uncore. Set Cmask=1 to count cycles.  |                                |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTANDING.ALL_DATA_RD    | Offcore outstanding cacheable data read transactions in SQ to uncore. Set Cmask=1 to count cycles.  |                                |
| 63H        | 01H         | LOCK_CYCLES.SPLIT_LOCK_UC_LOCK_DURATION     | Cycles in which the L1D and L2 are locked, due to a UC lock or split lock.  |                                |
| 63H        | 02H         | LOCK_CYCLES.CACHE_LOCK_DURATION             | Cycles in which the L1D is locked.  |                                |
| 79H        | 02H         | IDQ.EMPTY                                   | Counts cycles the IDQ is empty.   |                                |
| 79H        | 04H         | IDQ.MITE_UOPS                               | Increment each cycle # of uops delivered to IDQ from MITE path. Set Cmask = 1 to count cycles.  | Can combine Umask 04H and 20H. |
| 79H        | 08H         | IDQ.DSB_UOPS                                | Increment each cycle. # of uops delivered to IDQ from DSB path. Set Cmask = 1 to count cycles.  | Can combine Umask 08H and 10H. |
| 79H        | 10H         | IDQ.MS_DSB_UOPS                             | Increment each cycle # of uops delivered to IDQ when MS busy by DSB. Set Cmask = 1 to count cycles MS is busy. Set Cmask=1 and Edge =1 to count MS activations. | Can combine Umask 08H and 10H. |
| 79H        | 20H         | IDQ.MS_MITE_UOPS                            | Increment each cycle # of uops delivered to IDQ when MS is busy by MITE. Set Cmask = 1 to count cycles.   | Can combine Umask 04H and 20H. |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                           | Description   | Comment                             |
|------------|-------------|---|---|-------------------------------------|
| 79H        | 30H         | IDQ.MS_UOPS                                   | Increment each cycle # of uops delivered to IDQ from MS by either DSB or MITE. Set Cmask = 1 to count cycles. | Can combine Umask 04H, 08H and 30H. |
| 80H        | 02H         | ICACHE.MISSES                                 | Number of Instruction Cache, Streaming Buffer and Victim Cache Misses. Includes UC accesses.                  |                                     |
| 85H        | 01H         | ITLB_MISSES.MISS_CAUSES_A_WALK                | Misses in all ITLB levels that cause page walks.  |                                     |
| 85H        | 02H         | ITLB_MISSES.WALK_COMPLETED                    | Misses in all ITLB levels that cause completed page walks.  |                                     |
| 85H        | 04H         | ITLB_MISSES.WALK_DURATION                     | Cycle PMH is busy with a walk.  |                                     |
| 85H        | 10H         | ITLB_MISSES.STLB_HIT                          | Number of cache load STLB hits. No page walk.   |                                     |
| 87H        | 01H         | ILD_STALL.LCP                                 | Stalls caused by changing prefix length of the instruction.   |                                     |
| 87H        | 04H         | ILD_STALL.IQ_FULL                             | Stall cycles due to IQ is full.   |                                     |
| 88H        | 41H         | BR_INST_EXEC.NONTAKEN_CONDITIONAL             | Not-taken macro conditional branches.   |                                     |
| 88H        | 81H         | BR_INST_EXEC.TAKEN_CONDITIONAL                | Taken speculative and retired conditional branches.   |                                     |
| 88H        | 82H         | BR_INST_EXEC.TAKEN_DIRECT_JUMP                | Taken speculative and retired conditional branches excluding calls and indirects.                             |                                     |
| 88H        | 84H         | BR_INST_EXEC.TAKEN_INDIRECT_JUMP_NON_CALL_RET | Taken speculative and retired indirect branches excluding calls and returns.                                  |                                     |
| 88H        | 88H         | BR_INST_EXEC.TAKEN_INDIRECT_NEAR_RETURN       | Taken speculative and retired indirect branches that are returns.   |                                     |
| 88H        | 90H         | BR_INST_EXEC.TAKEN_DIRECT_NEAR_CALL           | Taken speculative and retired direct near calls.  |                                     |
| 88H        | A0H         | BR_INST_EXEC.TAKEN_INDIRECT_NEAR_CALL         | Taken speculative and retired indirect near calls.  |                                     |
| 88H        | C1H         | BR_INST_EXEC.ALL_CONDITIONAL                  | Speculative and retired conditional branches.   |                                     |
| 88H        | C2H         | BR_INST_EXEC.ALL_DIRECT_JUMP                  | Speculative and retired conditional branches excluding calls and indirects.                                   |                                     |
| 88H        | C4H         | BR_INST_EXEC.ALL_INDIRECT_JUMP_NON_CALL_RET   | Speculative and retired indirect branches excluding calls and returns.  |                                     |
| 88H        | C8H         | BR_INST_EXEC.ALL_INDIRECT_NEAR_RETURN         | Speculative and retired indirect branches that are returns.   |                                     |
| 88H        | D0H         | BR_INST_EXEC.ALL_NEAR_CALL                    | Speculative and retired direct near calls.  |                                     |
| 88H        | FFH         | BR_INST_EXEC.ALL_BRANCHES                     | Speculative and retired branches.   |                                     |
| 89H        | 41H         | BR_MISP_EXEC.NONTAKEN_CONDITIONAL             | Not-taken mispredicted macro conditional branches.  |                                     |
| 89H        | 81H         | BR_MISP_EXEC.TAKEN_CONDITIONAL                | Taken speculative and retired mispredicted conditional branches.  |                                     |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                           | Description   | Comment                       |
|------------|-------------|---|---|-------------------------------|
| 89H        | 84H         | BR_MISP_EXEC.TAKEN_INDIRECT_JUMP_NON_CALL_RET | Taken speculative and retired mispredicted indirect branches excluding calls and returns.                                 |                               |
| 89H        | 88H         | BR_MISP_EXEC.TAKEN_RETURN_NEAR                | Taken speculative and retired mispredicted indirect branches that are returns.  |                               |
| 89H        | 90H         | BR_MISP_EXEC.TAKEN_DIRECT_NEAR_CALL           | Taken speculative and retired mispredicted direct near calls.   |                               |
| 89H        | A0H         | BR_MISP_EXEC.TAKEN_INDIRECT_NEAR_CALL         | Taken speculative and retired mispredicted indirect near calls.   |                               |
| 89H        | C1H         | BR_MISP_EXEC.ALL_CONDITIONAL                  | Speculative and retired mispredicted conditional branches.  |                               |
| 89H        | C4H         | BR_MISP_EXEC.ALL_INDIRECT_JUMP_NON_CALL_RET   | Speculative and retired mispredicted indirect branches excluding calls and returns.                                       |                               |
| 89H        | D0H         | BR_MISP_EXEC.ALL_NEAR_CALL                    | Speculative and retired mispredicted direct near calls.   |                               |
| 89H        | FFH         | BR_MISP_EXEC.ALL_BRANCHES                     | Speculative and retired mispredicted branches.  |                               |
| 9CH        | 01H         | IDQ_UOPS_NOT_DELIVERED.CORE                   | Count issue pipeline slots where no uop was delivered from the front end to the back end when there is no back-end stall. | Use Cmask to qualify uop b/w. |
| A1H        | 01H         | UOPS_DISPATCHED_PORT.PORT_0                   | Cycles which a Uop is dispatched on port 0.   |                               |
| A1H        | 02H         | UOPS_DISPATCHED_PORT.PORT_1                   | Cycles which a Uop is dispatched on port 1.   |                               |
| A1H        | 0CH         | UOPS_DISPATCHED_PORT.PORT_2                   | Cycles which a Uop is dispatched on port 2.   |                               |
| A1H        | 30H         | UOPS_DISPATCHED_PORT.PORT_3                   | Cycles which a Uop is dispatched on port 3.   |                               |
| A1H        | 40H         | UOPS_DISPATCHED_PORT.PORT_4                   | Cycles which a Uop is dispatched on port 4.   |                               |
| A1H        | 80H         | UOPS_DISPATCHED_PORT.PORT_5                   | Cycles which a Uop is dispatched on port 5.   |                               |
| A2H        | 01H         | RESOURCE_STALLS.ANY                           | Cycles Allocation is stalled due to Resource Related reason.  |                               |
| A2H        | 02H         | RESOURCE_STALLS.LB                            | Counts the cycles of stall due to lack of load buffers.   |                               |
| A2H        | 04H         | RESOURCE_STALLS.RS                            | Cycles stalled due to no eligible RS entry available.   |                               |
| A2H        | 08H         | RESOURCE_STALLS.SB                            | Cycles stalled due to no store buffers available (not including draining from sync).                                      |                               |
| A2H        | 10H         | RESOURCE_STALLS.ROB                           | Cycles stalled due to re-order buffer full.   |                               |
| A2H        | 20H         | RESOURCE_STALLS.FCSW                          | Cycles stalled due to writing the FPU control word.   |                               |
| A3H        | 01H         | CYCLE_ACTIVITY.CYCLES_L2_PENDING              | Cycles with pending L2 miss loads. Set AnyThread to count per core.   |                               |
| A3H        | 02H         | CYCLE_ACTIVITY.CYCLES_L1D_PENDING             | Cycles with pending L1 cache miss loads. Set AnyThread to count per core.   | PMC2 only.                    |
| A3H        | 04H         | CYCLE_ACTIVITY.CYCLES_NO_DISPATCH             | Cycles of dispatch stalls. Set AnyThread to count per core.   | PMC0-3 only.                  |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                      | Description   | Comment                             |
|------------|-------------|--|---|-------------------------------------|
| A3H        | 05H         | CYCLE_ACTIVITY.STALL_CYCLE_S_L2_PENDING  |   | PMCO-3 only.                        |
| A3H        | 06H         | CYCLE_ACTIVITY.STALL_CYCLE_S_L1D_PENDING |   | PMC2 only.                          |
| A8H        | 01H         | LSD.UOPS                                 | Number of Uops delivered by the LSD.  |                                     |
| ABH        | 01H         | DSB2MITE_SWITCHES.COUNT                  | Number of DSB to MITE switches.   |                                     |
| ABH        | 02H         | DSB2MITE_SWITCHES.PENALTY_CYCLES         | Cycles DSB to MITE switches caused delay.   |                                     |
| ACH        | 02H         | DSB_FILL.OTHER_CANCEL                    | Cases of cancelling valid DSB fill not because of exceeding way limit.  |                                     |
| ACH        | 08H         | DSB_FILL.EXCEED_DSB_LINES                | DSB Fill encountered > 3 DSB lines.   |                                     |
| AEH        | 01H         | ITLB.ITLB_FLUSH                          | Counts the number of ITLB flushes; includes 4k/2M/4M pages.   |                                     |
| B0H        | 01H         | OFFCORE_REQUESTS.DEMAND_DATA_RD          | Demand data read requests sent to uncore.   |                                     |
| B0H        | 04H         | OFFCORE_REQUESTS.DEMAND_RFO              | Demand RFO read requests sent to uncore, including regular RFOs, locks, ItoM.   |                                     |
| B0H        | 08H         | OFFCORE_REQUESTS.ALL_DATA_RD             | Data read requests sent to uncore (demand and prefetch).  |                                     |
| B1H        | 01H         | UOPS_DISPATCHED.THREAD                   | Counts total number of uops to be dispatched per-thread each cycle. Set Cmask = 1, INV = 1 to count stall cycles.   | PMCO-3 only regardless HTT.         |
| B1H        | 02H         | UOPS_DISPATCHED.CORE                     | Counts total number of uops to be dispatched per-core each cycle.   | Do not need to set ANY.             |
| B2H        | 01H         | OFFCORE_REQUESTS_BUFFER_SQ_FULL          | Offcore requests buffer cannot take more entries for this thread core.  |                                     |
| B6H        | 01H         | AGU_BYPASS_CANCEL.COUNT                  | Counts executed load operations with all the following traits: 1. Addressing of the format [base + offset], 2. The offset is between 1 and 2047, 3. The address specified in the base register is in one page and the address [base+offset] is in another page. |                                     |
| B7H        | 01H         | OFF_CORE_RESPONSE_0                      | See Section 18.3.4.5, "Off-core Response Performance Monitoring".   | Requires MSR 01A6H.                 |
| BBH        | 01H         | OFF_CORE_RESPONSE_1                      | See Section 18.3.4.5, "Off-core Response Performance Monitoring".   | Requires MSR 01A7H.                 |
| BDH        | 01H         | TLB_FLUSH.DTLB_THREAD                    | DTLB flush attempts of the thread-specific entries.   |                                     |
| BDH        | 20H         | TLB_FLUSH.STLB_ANY                       | Count number of STLB flush attempts.  |                                     |
| BFH        | 05H         | L1D_BLOCKS.BANK_CONFLICT_CYCLES          | Cycles when dispatched loads are cancelled due to L1D bank conflicts with other load ports.   | Cmask=1.                            |
| COH        | 00H         | INST_RETIRED.ANY_P                       | Number of instructions at retirement.   | See Table 19-1.                     |
| COH        | 01H         | INST_RETIRED.PREC_DIST                   | Precise instruction retired event with HW to reduce effect of PEBS shadow in IP distribution.   | PMC1 only; must quiesce other PMCs. |
| C1H        | 02H         | OTHER_ASSISTS.ITLB_MISS_RETIRED          | Instructions that experienced an ITLB miss.   |                                     |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description  | Comment         |
|------------|-------------|--------------------------------|--|-----------------|
| C1H        | 08H         | OTHER_ASSISTS.AVX_STORE        | Number of assists associated with 256-bit AVX store operations.  |                 |
| C1H        | 10H         | OTHER_ASSISTS.AVX_TO_SSE       | Number of transitions from AVX-256 to legacy SSE when penalty applicable.  |                 |
| C1H        | 20H         | OTHER_ASSISTS.SSE_TO_AVX       | Number of transitions from SSE to AVX-256 when penalty applicable.   |                 |
| C2H        | 01H         | UOPS_RETIRED.ALL               | Counts the number of micro-ops retired, Use cmask=1 and invert to count active cycles or stalled cycles.                     | Supports PEBS.  |
| C2H        | 02H         | UOPS_RETIRED.RETIRE_SLOTS      | Counts the number of retirement slots used each cycle.   | Supports PEBS.  |
| C3H        | 02H         | MACHINE_CLEARS.MEMORY_ORDERING | Counts the number of machine clears due to memory order conflicts.   |                 |
| C3H        | 04H         | MACHINE_CLEARS.SMC             | Counts the number of times that a program writes to a code section.  |                 |
| C3H        | 20H         | MACHINE_CLEARS.MASKMOV         | Counts the number of executed AVX masked load operations that refer to an illegal address range with the mask bits set to 0. |                 |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES   | Branch instructions at retirement.   | See Table 19-1. |
| C4H        | 01H         | BR_INST_RETIRED.CONDITIONAL    | Counts the number of conditional branch instructions retired.  | Supports PEBS.  |
| C4H        | 02H         | BR_INST_RETIRED.NEAR_CALL      | Direct and indirect near call instructions retired.  | Supports PEBS.  |
| C4H        | 04H         | BR_INST_RETIRED.ALL_BRANCHES   | Counts the number of branch instructions retired.  | Supports PEBS.  |
| C4H        | 08H         | BR_INST_RETIRED.NEAR_RETURN    | Counts the number of near return instructions retired.   | Supports PEBS.  |
| C4H        | 10H         | BR_INST_RETIRED.NOT_TAKEN      | Counts the number of not taken branch instructions retired.  |                 |
| C4H        | 20H         | BR_INST_RETIRED.NEAR_TAKEN     | Number of near taken branches retired.   | Supports PEBS.  |
| C4H        | 40H         | BR_INST_RETIRED.FAR_BRANCH     | Number of far branches retired.  |                 |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANCHES   | Mispredicted branch instructions at retirement.  | See Table 19-1. |
| C5H        | 01H         | BR_MISP_RETIRED.CONDITIONAL    | Mispredicted conditional branch instructions retired.  | Supports PEBS.  |
| C5H        | 02H         | BR_MISP_RETIRED.NEAR_CALL      | Direct and indirect mispredicted near call instructions retired.   | Supports PEBS.  |
| C5H        | 04H         | BR_MISP_RETIRED.ALL_BRANCHES   | Mispredicted macro branch instructions retired.  | Supports PEBS.  |
| C5H        | 10H         | BR_MISP_RETIRED.NOT_TAKEN      | Mispredicted not taken branch instructions retired.  | Supports PEBS.  |
| C5H        | 20H         | BR_MISP_RETIRED.TAKEN          | Mispredicted taken branch instructions retired.  | Supports PEBS.  |
| CAH        | 02H         | FP_ASSIST.X87_OUTPUT           | Number of X87 assists due to output value.   |                 |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                         | Description  | Comment                                    |
|------------|-------------|---|--|--|
| CAH        | 04H         | FP_ASSIST.X87_INPUT                         | Number of X87 assists due to input value.  |  |
| CAH        | 08H         | FP_ASSIST.SIMD_OUTPUT                       | Number of SIMD FP assists due to output values.  |  |
| CAH        | 10H         | FP_ASSIST.SIMD_INPUT                        | Number of SIMD FP assists due to input values.   |  |
| CAH        | 1EH         | FP_ASSIST.ANY                               | Cycles with any input/output SSE* or FP assists.   |  |
| CCH        | 20H         | ROB_MISC_EVENTS.LBR_INSE<br>RTS             | Count cases of saving new LBR records by hardware.   |  |
| CDH        | 01H         | MEM_TRANS_RETIRED.LOAD_<br>LATENCY          | Randomly sampled loads whose latency is above a user defined threshold. A small fraction of the overall loads are sampled due to randomization. PMC3 only. | Specify threshold in MSR 3F6H.             |
| CDH        | 02H         | MEM_TRANS_RETIRED.PRECIS<br>E_STORE         | Sample stores and collect precise store operation via PEBS record. PMC3 only.  | See Section 18.3.4.4.3.                    |
| D0H        | 11H         | MEM_UOPS_RETIRED.STLB_MI<br>SS_LOADS        | Retired load uops that miss the STLB.  | Supports PEBS. PMC0-3 only regardless HTT. |
| D0H        | 12H         | MEM_UOPS_RETIRED.STLB_MI<br>SS_STORES       | Retired store uops that miss the STLB.   | Supports PEBS. PMC0-3 only regardless HTT. |
| D0H        | 21H         | MEM_UOPS_RETIRED.LOCK_LO<br>ADS             | Retired load uops with locked access.  | Supports PEBS. PMC0-3 only regardless HTT. |
| D0H        | 41H         | MEM_UOPS_RETIRED.SPLIT_L<br>OADS            | Retired load uops that split across a cacheline boundary.  | Supports PEBS. PMC0-3 only regardless HTT. |
| D0H        | 42H         | MEM_UOPS_RETIRED.SPLIT_S<br>TORES           | Retired store uops that split across a cacheline boundary.   | Supports PEBS. PMC0-3 only regardless HTT. |
| D0H        | 81H         | MEM_UOPS_RETIRED.ALL_LOA<br>DS              | All retired load uops.   | Supports PEBS. PMC0-3 only regardless HTT. |
| D0H        | 82H         | MEM_UOPS_RETIRED.ALL_STO<br>RES             | All retired store uops.  | Supports PEBS. PMC0-3 only regardless HTT. |
| D1H        | 01H         | MEM_LOAD_UOPS_RETIRED.L<br>1_HIT            | Retired load uops with L1 cache hits as data sources.  | Supports PEBS. PMC0-3 only regardless HTT. |
| D1H        | 02H         | MEM_LOAD_UOPS_RETIRED.L<br>2_HIT            | Retired load uops with L2 cache hits as data sources.  | Supports PEBS.                             |
| D1H        | 04H         | MEM_LOAD_UOPS_RETIRED.LL<br>C_HIT           | Retired load uops which data sources were data hits in LLC without snoops required.  | Supports PEBS.                             |
| D1H        | 20H         | MEM_LOAD_UOPS_RETIRED.LL<br>C_MISS          | Retired load uops which data sources were data missed LLC (excluding unknown data source).   | Supports PEBS.                             |
| D1H        | 40H         | MEM_LOAD_UOPS_RETIRED.HI<br>T_LFB           | Retired load uops which data sources were load uops missed L1 but hit FB due to preceding miss to the same cache line with data not ready.                 | Supports PEBS.                             |
| D2H        | 01H         | MEM_LOAD_UOPS_LLC_HIT_R<br>ETIRED.XSNP_MISS | Retired load uops whose data source was an on-package core cache LLC hit and cross-core snoop missed.  | Supports PEBS.                             |
| D2H        | 02H         | MEM_LOAD_UOPS_LLC_HIT_R<br>ETIRED.XSNP_HIT  | Retired load uops whose data source was an on-package LLC hit and cross-core snoop hits.   | Supports PEBS.                             |
| D2H        | 04H         | MEM_LOAD_UOPS_LLC_HIT_R<br>ETIRED.XSNP_HITM | Retired load uops whose data source was an on-package core cache with HitM responses.  | Supports PEBS.                             |
| D2H        | 08H         | MEM_LOAD_UOPS_LLC_HIT_R<br>ETIRED.XSNP_NONE | Retired load uops whose data source was LLC hit with no snoop required.  | Supports PEBS.                             |

**Table 19-15. Performance Events In the Processor Core Common to 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series and Intel® Xeon® Processors E3 and E5 Family (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic       | Description   | Comment                          |
|------------|-------------|---------------------------|---|----------------------------------|
| E6H        | 01H         | BACLEARS.ANY              | Counts the number of times the front end is re-steered, mainly when the BPU cannot provide a correct prediction and this is corrected by other branch handling mechanisms at the front end. |                                  |
| F0H        | 01H         | L2_TRANS.DEMAND_DATA_RD   | Demand Data Read requests that access L2 cache.   |                                  |
| F0H        | 02H         | L2_TRANS.RFO              | RFO requests that access L2 cache.  |                                  |
| F0H        | 04H         | L2_TRANS.CODE_RD          | L2 cache accesses when fetching instructions.   |                                  |
| F0H        | 08H         | L2_TRANS.ALL_PF           | L2 or LLC HW prefetches that access L2 cache.   | Including rejects.               |
| F0H        | 10H         | L2_TRANS.L1D_WB           | L1D writebacks that access L2 cache.  |                                  |
| F0H        | 20H         | L2_TRANS.L2_FILL          | L2 fill requests that access L2 cache.  |                                  |
| F0H        | 40H         | L2_TRANS.L2_WB            | L2 writebacks that access L2 cache.   |                                  |
| F0H        | 80H         | L2_TRANS.ALL_REQUESTS     | Transactions accessing L2 pipe.   |                                  |
| F1H        | 01H         | L2_LINES_IN.I             | L2 cache lines in I state filling L2.   | Counting does not cover rejects. |
| F1H        | 02H         | L2_LINES_IN.S             | L2 cache lines in S state filling L2.   | Counting does not cover rejects. |
| F1H        | 04H         | L2_LINES_IN.E             | L2 cache lines in E state filling L2.   | Counting does not cover rejects. |
| F1H        | 07H         | L2_LINES_IN.ALL           | L2 cache lines filling L2.  | Counting does not cover rejects. |
| F2H        | 01H         | L2_LINES_OUT.DEMAND_CLEAN | Clean L2 cache lines evicted by demand.   |                                  |
| F2H        | 02H         | L2_LINES_OUT.DEMAND_DIRTY | Dirty L2 cache lines evicted by demand.   |                                  |
| F2H        | 04H         | L2_LINES_OUT.PF_CLEAN     | Clean L2 cache lines evicted by L2 prefetch.  |                                  |
| F2H        | 08H         | L2_LINES_OUT.PF_DIRTY     | Dirty L2 cache lines evicted by L2 prefetch.  |                                  |
| F2H        | 0AH         | L2_LINES_OUT.DIRTY_ALL    | Dirty L2 cache lines filling the L2.  | Counting does not cover rejects. |
| F4H        | 10H         | SQ_MISC.SPLIT_LOCK        | Split locks in SQ.  |                                  |

Non-architecture performance monitoring events in the processor core that are applicable only to Intel processors with CPUID signature of DisplayFamily\_DisplayModel 06\_2AH are listed in Table 19-16.

**Table 19-16. Performance Events applicable only to the Processor core for 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series**

| Event Num. | Umask Value | Event Mask Mnemonic                     | Description   | Comment                                    |
|------------|-------------|---|---|--|
| D2H        | 01H         | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_MISS | Retired load uops which data sources were LLC hit and cross-core snoop missed in on-pkg core cache. | Supports PEBS. PMCO-3 only regardless HTT. |
| D2H        | 02H         | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HIT  | Retired load uops which data sources were LLC and cross-core snoop hits in on-pkg core cache.       | Supports PEBS.                             |
| D2H        | 04H         | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_HITM | Retired load uops which data sources were HitM responses from shared LLC.                           | Supports PEBS.                             |
| D2H        | 08H         | MEM_LOAD_UOPS_LLC_HIT_RETIRED.XSNP_NONE | Retired load uops which data sources were hits in LLC without snoops required.                      | Supports PEBS.                             |

**Table 19-16. Performance Events applicable only to the Processor core for 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic   | Description   | Comment                                    |
|------------|-------------|---|---|--|
| D4H        | 02H         | MEM_LOAD_UOPS_MISC_RETI<br>RED.LLC_MISS                         | Retired load uops with unknown information as data source in cache serviced the load.   | Supports PEBS. PMCO-3 only regardless HTT. |
| B7H/BBH    | 01H         | OFF_CORE_RESPONSE_N   | Sub-events of OFF_CORE_RESPONSE_N (suffix N = 0, 1) programmed using MSR 01A6H/01A7H with values shown in the comment column. |  |
|            |             | OFFCORE_RESPONSE.ALL_CODE_RD.LLC_HIT_N                          |   | 10003C0244H                                |
|            |             | OFFCORE_RESPONSE.ALL_CODE_RD.LLC_HIT.NO_SNOOP_NEEDED_N          |   | 1003C0244H                                 |
|            |             | OFFCORE_RESPONSE.ALL_CODE_RD.LLC_HIT.SNOOP_MISS_N               |   | 2003C0244H                                 |
|            |             | OFFCORE_RESPONSE.ALL_CODE_RD.LLC_HIT.MISS_DRAM_N                |   | 300400244H                                 |
|            |             | OFFCORE_RESPONSE.ALL_DATA_RD.LLC_HIT.ANY_RESPONSE_N             |   | 3F803C0091H                                |
|            |             | OFFCORE_RESPONSE.ALL_DATA_RD.LLC_MISS.DRAM_N                    |   | 300400091H                                 |
|            |             | OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.ANY_RESPONSE_N          |   | 3F803C0240H                                |
|            |             | OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.HIT_OTHER_CORE_NO_FWD_N |   | 4003C0240H                                 |
|            |             | OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.HITM_OTHER_CORE_N       |   | 10003C0240H                                |
|            |             | OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.NO_SNOOP_NEEDED_N       |   | 1003C0240H                                 |
|            |             | OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_HIT.SNOOP_MISS_N            |   | 2003C0240H                                 |
|            |             | OFFCORE_RESPONSE.ALL_PF_CODE_RD.LLC_MISS.DRAM_N                 |   | 300400240H                                 |
|            |             | OFFCORE_RESPONSE.ALL_PF_DATA_RD.LLC_MISS.DRAM_N                 |   | 300400090H                                 |
|            |             | OFFCORE_RESPONSE.ALL_PF_RFO.LLC_HIT.ANY_RESPONSE_N              |   | 3F803C0120H                                |
|            |             | OFFCORE_RESPONSE.ALL_PF_RFO.LLC_HIT.HIT_OTHER_CORE_NO_FWD_N     |   | 4003C0120H                                 |
|            |             | OFFCORE_RESPONSE.ALL_PF_RFO.LLC_HIT.HITM_OTHER_CORE_N           |   | 10003C0120H                                |
|            |             | OFFCORE_RESPONSE.ALL_PF_RFO.LLC_HIT.NO_SNOOP_NEEDED_N           |   | 1003C0120H                                 |

Non-architecture performance monitoring events in the processor core that are applicable only to Intel Xeon processor E5 family (and Intel Core i7-3930 processor) based on Intel microarchitecture code name Sandy Bridge, with CPUID signature of DisplayFamily\_DisplayModel 06\_2DH, are listed in Table 19-17.

**Table 19-17. Performance Events Applicable only to the Processor Core of Intel® Xeon® Processor E5 Family**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description   | Comment |
|------------|-------------|--------------------------------|---|---------|
| CDH        | 01H         | MEM_TRANS_RETIRED.LOAD_LATENCY | Additional Configuration: Disable BL bypass and direct2core, and if the memory is remotely homed. The count is not reliable If the memory is locally homed. |         |
| D1H        | 04H         | MEM_LOAD_UOPS_RETIRED.LLC_HIT  | Additional Configuration: Disable BL bypass. Supports PEBS.   |         |

**Table 19-17. Performance Events Applicable only to the Processor Core of Intel® Xeon® Processor E5 Family**

| Event Num. | Umask Value | Event Mask Mnemonic                                       | Description  | Comment   |
|------------|-------------|---|--|---|
| D1H        | 20H         | MEM_LOAD_UOPS_RETIREDC_MISS                               | Additional Configuration: Disable BL bypass and direct2core. Supports PEBS.  |   |
| D2H        | 01H         | MEM_LOAD_UOPS_LLC_HIT_RETIREDC_MISS                       | Additional Configuration: Disable bypass. Supports PEBS.   |   |
| D2H        | 02H         | MEM_LOAD_UOPS_LLC_HIT_RETIREDC_HIT                        | Additional Configuration: Disable bypass. Supports PEBS.   |   |
| D2H        | 04H         | MEM_LOAD_UOPS_LLC_HIT_RETIREDC_HITM                       | Additional Configuration: Disable bypass. Supports PEBS.   |   |
| D2H        | 08H         | MEM_LOAD_UOPS_LLC_HIT_RETIREDC_NONE                       | Additional Configuration: Disable bypass. Supports PEBS.   |   |
| D3H        | 01H         | MEM_LOAD_UOPS_LLC_MISS_RETIREDC_LOCAL_DRAM                | Retired load uops which data sources were data missed LLC but serviced by local DRAM. Supports PEBS.                         | Disable BL bypass and direct2core (see MSR 3C9H). |
| D3H        | 04H         | MEM_LOAD_UOPS_LLC_MISS_RETIREDC_REMOTE_DRAM               | Retired load uops which data sources were data missed LLC but serviced by remote DRAM. Supports PEBS.                        | Disable BL bypass and direct2core (see MSR 3C9H). |
| B7H/BBH    | 01H         | OFFCORE_RESPONSE_N  | Sub-events of OFFCORE_RESPONSE_N (suffix N = 0, 1) programmed using MSR 01A6H/01A7H with values shown in the comment column. |   |
|            |             | OFFCORE_RESPONSE.DEMAND_CODE_RD.LLC_MISS.ANY_RESPONSE_N   |  | 3FFF00004H  |
|            |             | OFFCORE_RESPONSE.DEMAND_CODE_RD.LLC_MISS.LOCAL_DRAM_N     |  | 600400004H  |
|            |             | OFFCORE_RESPONSE.DEMAND_CODE_RD.LLC_MISS.REMOTE_DRAM_N    |  | 67F800004H  |
|            |             | OFFCORE_RESPONSE.DEMAND_CODE_RD.LLC_MISS.REMOTE_HIT_FWD_N |  | 87F800004H  |
|            |             | OFFCORE_RESPONSE.DEMAND_CODE_RD.LLC_MISS.REMOTE_HITM_N    |  | 107FC00004H                                       |
|            |             | OFFCORE_RESPONSE.DEMAND_DATA_RD.LLC_MISS.ANY_DRAM_N       |  | 67FC00001H  |
|            |             | OFFCORE_RESPONSE.DEMAND_DATA_RD.LLC_MISS.ANY_RESPONSE_N   |  | 3F803C0001H                                       |
|            |             | OFFCORE_RESPONSE.DEMAND_DATA_RD.LLC_MISS.LOCAL_DRAM_N     |  | 600400001H  |
|            |             | OFFCORE_RESPONSE.DEMAND_DATA_RD.LLC_MISS.REMOTE_DRAM_N    |  | 67F800001H  |

|            |             | OFFCORE_RESPONSE.PF_L2_CODE_RD.LLC_MISS.ANY_RESPONSE_N    |  | 3F803C0040H                                       |
|            |             | OFFCORE_RESPONSE.PF_L2_DATA_RD.LLC_MISS.ANY_DRAM_N        |  | 67FC00010H  |
|            |             | OFFCORE_RESPONSE.PF_L2_DATA_RD.LLC_MISS.ANY_RESPONSE_N    |  | 3F803C0010H                                       |
|            |             | OFFCORE_RESPONSE.PF_L2_DATA_RD.LLC_MISS.LOCAL_DRAM_N      |  | 600400010H  |
|            |             | OFFCORE_RESPONSE.PF_L2_DATA_RD.LLC_MISS.REMOTE_DRAM_N     |  | 67F800010H  |
|            |             | OFFCORE_RESPONSE.PF_L2_DATA_RD.LLC_MISS.REMOTE_HIT_FWD_N  |  | 87F800010H  |
|            |             | OFFCORE_RESPONSE.PF_L2_DATA_RD.LLC_MISS.REMOTE_HITM_N     |  | 107FC00010H                                       |
|            |             | OFFCORE_RESPONSE.PF_LLC_CODE_RD.LLC_MISS.ANY_RESPONSE_N   |  | 3FFF00200H  |
|            |             | OFFCORE_RESPONSE.PF_LLC_DATA_RD.LLC_MISS.ANY_RESPONSE_N   |  | 3FFF00080H  |

Model-specific performance monitoring events that are located in the uncore sub-system are implementation specific between different platforms using processors based on Intel microarchitecture code name Sandy Bridge. Processors with CPUID signature of DisplayFamily\_DisplayModel 06\_2AH support performance events listed in Table 19-18.

**Table 19-18. Performance Events In the Processor Uncore for 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series**

| Event Num. <sup>1</sup> | Umask Value | Event Mask Mnemonic                     | Description   | Comment  |
|-------------------------|-------------|---|---|--|
| 22H                     | 01H         | UNC_CBO_XSNP_RESPONSE.MISS              | A snoop misses in some processor core.  | Must combine with one of the umask values of 20H, 40H, 80H.      |
| 22H                     | 02H         | UNC_CBO_XSNP_RESPONSE.INVAL             | A snoop invalidates a non-modified line in some processor core.   |  |
| 22H                     | 04H         | UNC_CBO_XSNP_RESPONSE.HIT               | A snoop hits a non-modified line in some processor core.  |  |
| 22H                     | 08H         | UNC_CBO_XSNP_RESPONSE.HITM              | A snoop hits a modified line in some processor core.  |  |
| 22H                     | 10H         | UNC_CBO_XSNP_RESPONSE.INVAL_M           | A snoop invalidates a modified line in some processor core.   |  |
| 22H                     | 20H         | UNC_CBO_XSNP_RESPONSE.EXTERNAL_FILTER   | Filter on cross-core snoops initiated by this Cbox due to external snoop request.   | Must combine with at least one of 01H, 02H, 04H, 08H, 10H.       |
| 22H                     | 40H         | UNC_CBO_XSNP_RESPONSE.CORE_FILTER       | Filter on cross-core snoops initiated by this Cbox due to processor core memory request.  |  |
| 22H                     | 80H         | UNC_CBO_XSNP_RESPONSE.EVICTION_FILTER   | Filter on cross-core snoops initiated by this Cbox due to LLC eviction.   |  |
| 34H                     | 01H         | UNC_CBO_CACHE_LOOKUP.M                  | LLC lookup request that access cache and found line in M-state.   | Must combine with one of the umask values of 10H, 20H, 40H, 80H. |
| 34H                     | 02H         | UNC_CBO_CACHE_LOOKUP.E                  | LLC lookup request that access cache and found line in E-state.   |  |
| 34H                     | 04H         | UNC_CBO_CACHE_LOOKUP.S                  | LLC lookup request that access cache and found line in S-state.   |  |
| 34H                     | 08H         | UNC_CBO_CACHE_LOOKUP.I                  | LLC lookup request that access cache and found line in I-state.   |  |
| 34H                     | 10H         | UNC_CBO_CACHE_LOOKUP.READ_FILTER        | Filter on processor core initiated cacheable read requests. Must combine with at least one of 01H, 02H, 04H, 08H.   |  |
| 34H                     | 20H         | UNC_CBO_CACHE_LOOKUP.WRITE_FILTER       | Filter on processor core initiated cacheable write requests. Must combine with at least one of 01H, 02H, 04H, 08H.  |  |
| 34H                     | 40H         | UNC_CBO_CACHE_LOOKUP.EXTSNP_FILTER      | Filter on external snoop requests. Must combine with at least one of 01H, 02H, 04H, 08H.  |  |
| 34H                     | 80H         | UNC_CBO_CACHE_LOOKUP.ANY_REQUEST_FILTER | Filter on any IRQ or IPQ initiated requests including uncacheable, non-coherent requests. Must combine with at least one of 01H, 02H, 04H, 08H.   |  |
| 80H                     | 01H         | UNC_ARB_TRK_OCCUPANCY.ALL               | Counts cycles weighted by the number of requests waiting for data returning from the memory controller. Accounts for coherent and non-coherent requests initiated by IA cores, processor graphic units, or LLC. | Counter 0 only.  |
| 81H                     | 01H         | UNC_ARB_TRK_REQUEST.ALL                 | Counts the number of coherent and in-coherent requests initiated by IA cores, processor graphic units, or LLC.  |  |
| 81H                     | 20H         | UNC_ARB_TRK_REQUEST.WRITES              | Counts the number of allocated write entries, include full, partial, and LLC evictions.   |  |
| 81H                     | 80H         | UNC_ARB_TRK_REQUEST.EVICTIONS           | Counts the number of LLC evictions allocated.   |  |

**Table 19-18. Performance Events In the Processor Uncore for 2nd Generation Intel® Core™ i7-2xxx, Intel® Core™ i5-2xxx, Intel® Core™ i3-2xxx Processor Series (Contd.)**

| Event Num. <sup>1</sup> | Umask Value | Event Mask Mnemonic           | Description   | Comment         |
|-------------------------|-------------|-------------------------------|---|-----------------|
| 83H                     | 01H         | UNC_ARB_COH_TRK_OCCUPANCY.ALL | Cycles weighted by number of requests pending in Coherency Tracker. | Counter 0 only. |
| 84H                     | 01H         | UNC_ARB_COH_TRK_REQUESTS.ALL  | Number of requests allocated in Coherency Tracker.                  |                 |

**NOTES:**

1. The uncore events must be programmed using MSRs located in specific performance monitoring units in the uncore. UNC\_CBO\* events are supported using MSR\_UNC\_CBO\* MSRs; UNC\_ARB\* events are supported using MSR\_UNC\_ARB\* MSRs.

## 19.9 PERFORMANCE MONITORING EVENTS FOR INTEL® CORE™ I7 PROCESSOR FAMILY AND INTEL® XEON® PROCESSOR FAMILY

Processors based on the Intel microarchitecture code name Nehalem support the architectural and model-specific performance monitoring events listed in Table 19-1 and Table 19-19. The events in Table 19-19 generally applies to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following values: 06\_1AH, 06\_1EH, 06\_1FH, and 06\_2EH. However, Intel Xeon processors with CPUID signature of DisplayFamily\_DisplayModel 06\_2EH have a small number of events that are not supported in processors with CPUID signature 06\_1AH, 06\_1EH, and 06\_1FH. These events are noted in the comment column.

In addition, these processors (CPUID signature of DisplayFamily\_DisplayModel 06\_1AH, 06\_1EH, 06\_1FH) also support the following model-specific, product-specific uncore performance monitoring events listed in Table 19-20.

Fixed counters in the core PMU support the architecture events defined in Table 19-2.

**Table 19-19. Performance Events In the Processor Core for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series**

| Event Num. | Umask Value | Event Mask Mnemonic                   | Description   | Comment |
|------------|-------------|---------------------------------------|---|---------|
| 04H        | 07H         | SB_DRAIN.ANY                          | Counts the number of store buffer drains.   |         |
| 06H        | 04H         | STORE_BLOCKS.AT_RET                   | Counts number of loads delayed with at-Retirement block code. The following loads need to be executed at retirement and wait for all senior stores on the same thread to be drained: load splitting across 4K boundary (page split), load accessing uncacheable (UC or WC) memory, load lock, and load with page table in UC or WC memory region. |         |
| 06H        | 08H         | STORE_BLOCKS.L1D_BLOCK                | Cacheable loads delayed with L1D block code.  |         |
| 07H        | 01H         | PARTIAL_ADDRESS_ALIAS                 | Counts false dependency due to partial address aliasing.  |         |
| 08H        | 01H         | DTLB_LOAD_MISSES.ANY                  | Counts all load misses that cause a page walk.  |         |
| 08H        | 02H         | DTLB_LOAD_MISSES.WALK_COMPLETED       | Counts number of completed page walks due to load miss in the STLB.   |         |
| 08H        | 10H         | DTLB_LOAD_MISSES.STLB_HIT             | Number of cache load STLB hits.   |         |
| 08H        | 20H         | DTLB_LOAD_MISSES.PDE_MISSES           | Number of DTLB cache load misses where the low part of the linear to physical address translation was missed.   |         |
| 08H        | 80H         | DTLB_LOAD_MISSES.LARGE_WALK_COMPLETED | Counts number of completed large page walks due to load miss in the STLB.   |         |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                            | Description  | Comment                                    |
|------------|-------------|--|--|--|
| 0BH        | 01H         | MEM_INST_RETIRED.LOADS                         | Counts the number of instructions with an architecturally-visible load retired on the architected path.  |  |
| 0BH        | 02H         | MEM_INST_RETIRED.STORES                        | Counts the number of instructions with an architecturally-visible store retired on the architected path.   |  |
| 0BH        | 10H         | MEM_INST_RETIRED.LATENCY_ABOVE_THRESHOLD       | Counts the number of instructions exceeding the latency specified with Id_lat facility.  | In conjunction with Id_lat facility.       |
| 0CH        | 01H         | MEM_STORE_RETIRED.DTLB_MISS                    | The event counts the number of retired stores that missed the DTLB. The DTLB miss is not counted if the store operation causes a fault. Does not counter prefetches. Counts both primary and secondary misses to the TLB.                          |  |
| 0EH        | 01H         | UOPS_ISSUED.ANY                                | Counts the number of Uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.   |  |
| 0EH        | 01H         | UOPS_ISSUED.STALLED_CYCLE S                    | Counts the number of cycles no Uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.   | Set "invert=1, cmask = 1".                 |
| 0EH        | 02H         | UOPS_ISSUED.FUSED                              | Counts the number of fused Uops that were issued from the Register Allocation Table to the Reservation Station.  |  |
| 0FH        | 01H         | MEM_UNCORE_RETIRED.L3_DATA_MISS_UNKNOWN        | Counts number of memory load instructions retired where the memory reference missed L3 and data source is unknown.   | Available only for CPUID signature 06_2EH. |
| 0FH        | 02H         | MEM_UNCORE_RETIRED.OTHER_CORE_L2_HITM          | Counts number of memory load instructions retired where the memory reference hit modified data in a sibling core residing on the same socket.  |  |
| 0FH        | 08H         | MEM_UNCORE_RETIRED.REMOTE_CACHE_LOCAL_HOME_HIT | Counts number of memory load instructions retired where the memory reference missed the L1, L2 and L3 caches and HIT in a remote socket's cache. Only counts locally homed lines.  |  |
| 0FH        | 10H         | MEM_UNCORE_RETIRED.REMOTE_DRAM                 | Counts number of memory load instructions retired where the memory reference missed the L1, L2 and L3 caches and was remotely homed. This includes both DRAM access and HITM in a remote socket's cache for remotely homed lines.                  |  |
| 0FH        | 20H         | MEM_UNCORE_RETIRED.LOCAL_DRAM                  | Counts number of memory load instructions retired where the memory reference missed the L1, L2 and L3 caches and required a local socket memory reference. This includes locally homed cachelines that were in a modified state in another socket. |  |
| 0FH        | 80H         | MEM_UNCORE_RETIRED.UNCACHEABLE                 | Counts number of memory load instructions retired where the memory reference missed the L1, L2 and L3 caches and to perform I/O.   | Available only for CPUID signature 06_2EH. |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                  | Description   | Comment |
|------------|-------------|--------------------------------------|---|---------|
| 10H        | 01H         | FP_COMP_OPS_EXE.X87                  | Counts the number of FP Computational Uops Executed. The number of FADD, FSUB, FCOM, FMULs, integer MULs and IMULs, FDIVs, FPREMs, FSQRTS, integer DIVs, and IDIVs. This event does not distinguish an FADD used in the middle of a transcendental flow from a separate FADD instruction. |         |
| 10H        | 02H         | FP_COMP_OPS_EXE.MMX                  | Counts number of MMX Uops executed.   |         |
| 10H        | 04H         | FP_COMP_OPS_EXE.SSE_FP               | Counts number of SSE and SSE2 FP uops executed.   |         |
| 10H        | 08H         | FP_COMP_OPS_EXE.SSE2_INTEGER         | Counts number of SSE2 integer uops executed.  |         |
| 10H        | 10H         | FP_COMP_OPS_EXE.SSE_FP_PACKED        | Counts number of SSE FP packed uops executed.   |         |
| 10H        | 20H         | FP_COMP_OPS_EXE.SSE_FP_SCALAR        | Counts number of SSE FP scalar uops executed.   |         |
| 10H        | 40H         | FP_COMP_OPS_EXE.SSE_SINGLE_PRECISION | Counts number of SSE* FP single precision uops executed.  |         |
| 10H        | 80H         | FP_COMP_OPS_EXE.SSE_DOUBLE_PRECISION | Counts number of SSE* FP double precision uops executed.  |         |
| 12H        | 01H         | SIMD_INT_128.PACKED_MPY              | Counts number of 128 bit SIMD integer multiply operations.  |         |
| 12H        | 02H         | SIMD_INT_128.PACKED_SHIFT            | Counts number of 128 bit SIMD integer shift operations.   |         |
| 12H        | 04H         | SIMD_INT_128.PACK                    | Counts number of 128 bit SIMD integer pack operations.  |         |
| 12H        | 08H         | SIMD_INT_128.UNPACK                  | Counts number of 128 bit SIMD integer unpack operations.  |         |
| 12H        | 10H         | SIMD_INT_128.PACKED_LOGICAL          | Counts number of 128 bit SIMD integer logical operations.   |         |
| 12H        | 20H         | SIMD_INT_128.PACKED_ARITH            | Counts number of 128 bit SIMD integer arithmetic operations.  |         |
| 12H        | 40H         | SIMD_INT_128.SHUFFLE_MOVE            | Counts number of 128 bit SIMD integer shuffle and move operations.  |         |
| 13H        | 01H         | LOAD_DISPATCH.RS                     | Counts number of loads dispatched from the Reservation Station that bypass the Memory Order Buffer.   |         |
| 13H        | 02H         | LOAD_DISPATCH.RS_DELAYED             | Counts the number of delayed RS dispatches at the stage latch. If an RS dispatch cannot bypass to LB, it has another chance to dispatch from the one-cycle delayed staging latch before it is written into the LB.  |         |
| 13H        | 04H         | LOAD_DISPATCH.MOB                    | Counts the number of loads dispatched from the Reservation Station to the Memory Order Buffer.  |         |
| 13H        | 07H         | LOAD_DISPATCH.ANY                    | Counts all loads dispatched from the Reservation Station.   |         |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic     | Description  | Comment  |
|------------|-------------|-------------------------|--|--|
| 14H        | 01H         | ARITH.CYCLES_DIV_BUSY   | Counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE.<br>Set 'edge =1, invert=1, cmask=1' to count the number of divides.   | Count may be incorrect When SMT is on.   |
| 14H        | 02H         | ARITH.MUL               | Counts the number of multiply operations executed. This includes integer as well as floating point multiply operations but excludes DPPS mul and MPSAD.  | Count may be incorrect When SMT is on.   |
| 17H        | 01H         | INST_QUEUE_WRITES       | Counts the number of instructions written into the instruction queue every cycle.  |  |
| 18H        | 01H         | INST_DECODED.DECO       | Counts number of instructions that require decoder 0 to be decoded. Usually, this means that the instruction maps to more than 1 uop.  |  |
| 19H        | 01H         | TWO_UOP_INSTS_DECODED   | An instruction that generates two uops was decoded.  |  |
| 1EH        | 01H         | INST_QUEUE_WRITE_CYCLES | This event counts the number of cycles during which instructions are written to the instruction queue. Dividing this counter by the number of instructions written to the instruction queue (INST_QUEUE_WRITES) yields the average number of instructions decoded each cycle. If this number is less than four and the pipe stalls, this indicates that the decoder is failing to decode enough instructions per cycle to sustain the 4-wide pipeline. | If SSE* instructions that are 6 bytes or longer arrive one after another, then front end throughput may limit execution speed. |
| 20H        | 01H         | LSD_OVERFLOW            | Counts number of loops that can't stream from the instruction queue.   |  |
| 24H        | 01H         | L2_RQSTS.LD_HIT         | Counts number of loads that hit the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches. L2 loads can be rejected for various reasons. Only non rejected loads are counted.  |  |
| 24H        | 02H         | L2_RQSTS.LD_MISS        | Counts the number of loads that miss the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches.  |  |
| 24H        | 03H         | L2_RQSTS.LOADS          | Counts all L2 load requests. L2 loads include both L1D demand misses as well as L1D prefetches.  |  |
| 24H        | 04H         | L2_RQSTS.RFO_HIT        | Counts the number of store RFO requests that hit the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches. Count includes WC memory requests, where the data is not fetched but the permission to write the line is required.  |  |
| 24H        | 08H         | L2_RQSTS.RFO_MISS       | Counts the number of store RFO requests that miss the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.  |  |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description   | Comment |
|------------|-------------|--------------------------------|---|---------|
| 24H        | 0CH         | L2_RQSTS.RFOS                  | Counts all L2 store RFO requests. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.   |         |
| 24H        | 10H         | L2_RQSTS.IFETCH_HIT            | Counts number of instruction fetches that hit the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.  |         |
| 24H        | 20H         | L2_RQSTS.IFETCH_MISS           | Counts number of instruction fetches that miss the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.   |         |
| 24H        | 30H         | L2_RQSTS.IFETCHES              | Counts all instruction fetches. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.  |         |
| 24H        | 40H         | L2_RQSTS.PREFETCH_HIT          | Counts L2 prefetch hits for both code and data.   |         |
| 24H        | 80H         | L2_RQSTS.PREFETCH_MISS         | Counts L2 prefetch misses for both code and data.   |         |
| 24H        | C0H         | L2_RQSTS.PREFETCHES            | Counts all L2 prefetches for both code and data.  |         |
| 24H        | AAH         | L2_RQSTS.MISS                  | Counts all L2 misses for both code and data.  |         |
| 24H        | FFH         | L2_RQSTS.REFERENCES            | Counts all L2 requests for both code and data.  |         |
| 26H        | 01H         | L2_DATA_RQSTS.DEMAND.I_STATE   | Counts number of L2 data demand loads where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss. L2 demand loads are both L1D demand misses and L1D prefetches.               |         |
| 26H        | 02H         | L2_DATA_RQSTS.DEMAND.S_STATE   | Counts number of L2 data demand loads where the cache line to be loaded is in the S (shared) state. L2 demand loads are both L1D demand misses and L1D prefetches.                                    |         |
| 26H        | 04H         | L2_DATA_RQSTS.DEMAND.E_STATE   | Counts number of L2 data demand loads where the cache line to be loaded is in the E (exclusive) state. L2 demand loads are both L1D demand misses and L1D prefetches.                                 |         |
| 26H        | 08H         | L2_DATA_RQSTS.DEMAND.M_STATE   | Counts number of L2 data demand loads where the cache line to be loaded is in the M (modified) state. L2 demand loads are both L1D demand misses and L1D prefetches.                                  |         |
| 26H        | 0FH         | L2_DATA_RQSTS.DEMAND.MESI      | Counts all L2 data demand requests. L2 demand loads are both L1D demand misses and L1D prefetches.  |         |
| 26H        | 10H         | L2_DATA_RQSTS.PREFETCH.I_STATE | Counts number of L2 prefetch data loads where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss.  |         |
| 26H        | 20H         | L2_DATA_RQSTS.PREFETCH.S_STATE | Counts number of L2 prefetch data loads where the cache line to be loaded is in the S (shared) state. A prefetch RFO will miss on an S state line, while a prefetch read will hit on an S state line. |         |
| 26H        | 40H         | L2_DATA_RQSTS.PREFETCH.E_STATE | Counts number of L2 prefetch data loads where the cache line to be loaded is in the E (exclusive) state.  |         |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description  | Comment                       |
|------------|-------------|--------------------------------|--|-------------------------------|
| 26H        | 80H         | L2_DATA_RQSTS.PREFETCH.M_STATE | Counts number of L2 prefetch data loads where the cache line to be loaded is in the M (modified) state.  |                               |
| 26H        | F0H         | L2_DATA_RQSTS.PREFETCH.MESI    | Counts all L2 prefetch requests.   |                               |
| 26H        | FFH         | L2_DATA_RQSTS.ANY              | Counts all L2 data requests.   |                               |
| 27H        | 01H         | L2_WRITE.RFO.I_STATE           | Counts number of L2 demand store RFO requests where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss. The L1D prefetcher does not issue a RFO prefetch. | This is a demand RFO request. |
| 27H        | 02H         | L2_WRITE.RFO.S_STATE           | Counts number of L2 store RFO requests where the cache line to be loaded is in the S (shared) state. The L1D prefetcher does not issue a RFO prefetch.                             | This is a demand RFO request. |
| 27H        | 08H         | L2_WRITE.RFO.M_STATE           | Counts number of L2 store RFO requests where the cache line to be loaded is in the M (modified) state. The L1D prefetcher does not issue a RFO prefetch.                           | This is a demand RFO request. |
| 27H        | 0EH         | L2_WRITE.RFO.HIT               | Counts number of L2 store RFO requests where the cache line to be loaded is in either the S, E or M states. The L1D prefetcher does not issue a RFO prefetch.                      | This is a demand RFO request. |
| 27H        | 0FH         | L2_WRITE.RFO.MESI              | Counts all L2 store RFO requests. The L1D prefetcher does not issue a RFO prefetch.  | This is a demand RFO request. |
| 27H        | 10H         | L2_WRITE.LOCK.I_STATE          | Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the I (invalid) state, for example, a cache miss.   |                               |
| 27H        | 20H         | L2_WRITE.LOCK.S_STATE          | Counts number of L2 lock RFO requests where the cache line to be loaded is in the S (shared) state.  |                               |
| 27H        | 40H         | L2_WRITE.LOCK.E_STATE          | Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the E (exclusive) state.  |                               |
| 27H        | 80H         | L2_WRITE.LOCK.M_STATE          | Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the M (modified) state.   |                               |
| 27H        | E0H         | L2_WRITE.LOCK.HIT              | Counts number of L2 demand lock RFO requests where the cache line to be loaded is in either the S, E, or M state.  |                               |
| 27H        | F0H         | L2_WRITE.LOCK.MESI             | Counts all L2 demand lock RFO requests.  |                               |
| 28H        | 01H         | L1D_WB_L2.I_STATE              | Counts number of L1 writebacks to the L2 where the cache line to be written is in the I (invalid) state, i.e., a cache miss.   |                               |
| 28H        | 02H         | L1D_WB_L2.S_STATE              | Counts number of L1 writebacks to the L2 where the cache line to be written is in the S state.   |                               |
| 28H        | 04H         | L1D_WB_L2.E_STATE              | Counts number of L1 writebacks to the L2 where the cache line to be written is in the E (exclusive) state.   |                               |
| 28H        | 08H         | L1D_WB_L2.M_STATE              | Counts number of L1 writebacks to the L2 where the cache line to be written is in the M (modified) state.  |                               |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic       | Description  | Comment  |
|------------|-------------|---------------------------|--|--|
| 28H        | 0FH         | L1D_WB_L2.MESI            | Counts all L1 writebacks to the L2 .   |  |
| 2EH        | 4FH         | L3_LAT_CACHE.REFERENCE    | This event counts requests originating from the core that reference a cache line in the last level cache. The event count includes speculative traffic but excludes cache line fills due to a L2 hardware-prefetch. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended. | See Table 19-1.  |
| 2EH        | 41H         | L3_LAT_CACHE.MISS         | This event counts each cache miss condition for references to the last level cache. The event count may include speculative traffic but excludes cache line fills due to L2 hardware-prefetches. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.                    | See Table 19-1.  |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P | Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling.   | See Table 19-1.  |
| 3CH        | 01H         | CPU_CLK_UNHALTED.REF_P    | Increments at the frequency of TSC when not halted.  | See Table 19-1.  |
| 40H        | 01H         | L1D_CACHE_LD.I_STATE      | Counts L1 data cache read requests where the cache line to be loaded is in the I (invalid) state, i.e. the read request missed the cache.  | Counter 0, 1 only.   |
| 40H        | 02H         | L1D_CACHE_LD.S_STATE      | Counts L1 data cache read requests where the cache line to be loaded is in the S (shared) state.   | Counter 0, 1 only.   |
| 40H        | 04H         | L1D_CACHE_LD.E_STATE      | Counts L1 data cache read requests where the cache line to be loaded is in the E (exclusive) state.  | Counter 0, 1 only.   |
| 40H        | 08H         | L1D_CACHE_LD.M_STATE      | Counts L1 data cache read requests where the cache line to be loaded is in the M (modified) state.   | Counter 0, 1 only.   |
| 40H        | 0FH         | L1D_CACHE_LD.MESI         | Counts L1 data cache read requests.  | Counter 0, 1 only.   |
| 41H        | 02H         | L1D_CACHE_ST.S_STATE      | Counts L1 data cache store RFO requests where the cache line to be loaded is in the S (shared) state.  | Counter 0, 1 only.   |
| 41H        | 04H         | L1D_CACHE_ST.E_STATE      | Counts L1 data cache store RFO requests where the cache line to be loaded is in the E (exclusive) state.   | Counter 0, 1 only.   |
| 41H        | 08H         | L1D_CACHE_ST.M_STATE      | Counts L1 data cache store RFO requests where cache line to be loaded is in the M (modified) state.  | Counter 0, 1 only.   |
| 42H        | 01H         | L1D_CACHE_LOCK.HIT        | Counts retired load locks that hit in the L1 data cache or hit in an already allocated fill buffer. The lock portion of the load lock transaction must hit in the L1D.   | The initial load will pull the lock into the L1 data cache. Counter 0, 1 only. |
| 42H        | 02H         | L1D_CACHE_LOCK.S_STATE    | Counts L1 data cache retired load locks that hit the target cache line in the shared state.  | Counter 0, 1 only.   |
| 42H        | 04H         | L1D_CACHE_LOCK.E_STATE    | Counts L1 data cache retired load locks that hit the target cache line in the exclusive state.   | Counter 0, 1 only.   |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic              | Description   | Comment  |
|------------|-------------|----------------------------------|---|--|
| 42H        | 08H         | L1D_CACHE_LOCK.M_STATE           | Counts L1 data cache retired load locks that hit the target cache line in the modified state.   | Counter 0, 1 only.   |
| 43H        | 01H         | L1D_ALL_REF.ANY                  | Counts all references (uncached, speculated and retired) to the L1 data cache, including all loads and stores with any memory types. The event counts memory accesses only when they are actually performed. For example, a load blocked by unknown store address and later performed is only counted once.   | The event does not include non-memory accesses, such as I/O accesses. Counter 0, 1 only. |
| 43H        | 02H         | L1D_ALL_REF.CACHEABLE            | Counts all data reads and writes (speculated and retired) from cacheable memory, including locked operations.   | Counter 0, 1 only.   |
| 49H        | 01H         | DTLB_MISSES.ANY                  | Counts the number of misses in the STLB which causes a page walk.   |  |
| 49H        | 02H         | DTLB_MISSES.WALK_COMPLETED       | Counts number of misses in the STLB which resulted in a completed page walk.  |  |
| 49H        | 10H         | DTLB_MISSES.STLB_HIT             | Counts the number of DTLB first level misses that hit in the second level TLB. This event is only relevant if the core contains multiple DTLB levels.   |  |
| 49H        | 20H         | DTLB_MISSES.PDE_MISS             | Number of DTLB misses caused by low part of address, includes references to 2M pages because 2M pages do not use the PDE.   |  |
| 49H        | 80H         | DTLB_MISSES.LARGE_WALK_COMPLETED | Counts number of misses in the STLB which resulted in a completed page walk for large pages.  |  |
| 4CH        | 01H         | LOAD_HIT_PRE                     | Counts load operations sent to the L1 data cache while a previous SSE prefetch instruction to the same cache line has started prefetching but has not yet finished.   |  |
| 4EH        | 01H         | L1D_PREFETCH.REQUESTS            | Counts number of hardware prefetch requests dispatched out of the prefetch FIFO.  |  |
| 4EH        | 02H         | L1D_PREFETCH.MISS                | Counts number of hardware prefetch requests that miss the L1D. There are two prefetchers in the L1D. A streamer, which predicts lines sequentially after this one should be fetched, and the IP prefetcher that remembers access patterns for the current instruction. The streamer prefetcher stops on an L1D hit, while the IP prefetcher does not. |  |
| 4EH        | 04H         | L1D_PREFETCH.TRIGGERS            | Counts number of prefetch requests triggered by the Finite State Machine and pushed into the prefetch FIFO. Some of the prefetch requests are dropped due to overwrites or competition between the IP index prefetcher and streamer prefetcher. The prefetch FIFO contains 4 entries.   |  |
| 51H        | 01H         | L1D.REPL                         | Counts the number of lines brought into the L1 data cache.  | Counter 0, 1 only.   |
| 51H        | 02H         | L1D.M_REPL                       | Counts the number of modified lines brought into the L1 data cache.   | Counter 0, 1 only.   |
| 51H        | 04H         | L1D.M_EVICT                      | Counts the number of modified lines evicted from the L1 data cache due to replacement.  | Counter 0, 1 only.   |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description  | Comment   |
|------------|-------------|--------------------------------|--|---|
| 51H        | 08H         | L1D.M_SNOOP_EVICT              | Counts the number of modified lines evicted from the L1 data cache due to snoop HITM intervention.   | Counter 0, 1 only.  |
| 52H        | 01H         | L1D_CACHE_PREFETCH_LOCK_FB_HIT | Counts the number of cacheable load lock speculated instructions accepted into the fill buffer.  |   |
| 53H        | 01H         | L1D_CACHE_LOCK_FB_HIT          | Counts the number of cacheable load lock speculated or retired instructions accepted into the fill buffer.   |   |
| 63H        | 01H         | CACHE_LOCK_CYCLES.L1D_L2       | Cycle count during which the L1D and L2 are locked. A lock is asserted when there is a locked memory access, due to uncacheable memory, a locked operation that spans two cache lines, or a page walk from an uncacheable page table.                                | Counter 0, 1 only. L1D and L2 locks have a very high performance penalty and it is highly recommended to avoid such accesses. |
| 63H        | 02H         | CACHE_LOCK_CYCLES.L1D          | Counts the number of cycles that cacheline in the L1 data cache unit is locked.  | Counter 0, 1 only.  |
| 6CH        | 01H         | IO_TRANSACTIONS                | Counts the number of completed I/O transactions.   |   |
| 80H        | 01H         | L1I.HITS                       | Counts all instruction fetches that hit the L1 instruction cache.  |   |
| 80H        | 02H         | L1I.MISSES                     | Counts all instruction fetches that miss the L1I cache. This includes instruction cache misses, streaming buffer misses, victim cache misses and uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding. |   |
| 80H        | 03H         | L1I.READS                      | Counts all instruction fetches, including uncacheable fetches that bypass the L1I.   |   |
| 80H        | 04H         | L1I.CYCLES_STALLED             | Cycle counts for which an instruction fetch stalls due to a L1I cache miss, ITLB miss or ITLB fault.   |   |
| 82H        | 01H         | LARGE_ITLB.HIT                 | Counts number of large ITLB hits.  |   |
| 85H        | 01H         | ITLB_MISSES.ANY                | Counts the number of misses in all levels of the ITLB which causes a page walk.  |   |
| 85H        | 02H         | ITLB_MISSES.WALK_COMPLETED     | Counts number of misses in all levels of the ITLB which resulted in a completed page walk.   |   |
| 87H        | 01H         | ILD_STALL.LCP                  | Cycles Instruction Length Decoder stalls due to length changing prefixes: 66, 67 or REX.W (for Intel 64) instructions which change the length of the decoded instruction.  |   |
| 87H        | 02H         | ILD_STALL.MRU                  | Instruction Length Decoder stall cycles due to Branch Prediction Unit (PBU) Most Recently Used (MRU) bypass.   |   |
| 87H        | 04H         | ILD_STALL.IQ_FULL              | Stall cycles due to a full instruction queue.  |   |
| 87H        | 08H         | ILD_STALL.REGEN                | Counts the number of regen stalls.   |   |
| 87H        | 0FH         | ILD_STALL.ANY                  | Counts any cycles the Instruction Length Decoder is stalled.   |   |
| 88H        | 01H         | BR_INST_EXEC.COND              | Counts the number of conditional near branch instructions executed, but not necessarily retired.   |   |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic             | Description   | Comment |
|------------|-------------|---------------------------------|---|---------|
| 88H        | 02H         | BR_INST_EXEC.DIRECT             | Counts all unconditional near branch instructions excluding calls and indirect branches.  |         |
| 88H        | 04H         | BR_INST_EXEC.INDIRECT_NON_CALL  | Counts the number of executed indirect near branch instructions that are not calls.   |         |
| 88H        | 07H         | BR_INST_EXEC.NON_CALLS          | Counts all non-call near branch instructions executed, but not necessarily retired.   |         |
| 88H        | 08H         | BR_INST_EXEC.RETURN_NEAR        | Counts indirect near branches that have a return mnemonic.  |         |
| 88H        | 10H         | BR_INST_EXEC.DIRECT_NEAR_CALL   | Counts unconditional near call branch instructions, excluding non-call branch, executed.  |         |
| 88H        | 20H         | BR_INST_EXEC.INDIRECT_NEAR_CALL | Counts indirect near calls, including both register and memory indirect, executed.  |         |
| 88H        | 30H         | BR_INST_EXEC.NEAR_CALLS         | Counts all near call branches executed, but not necessarily retired.  |         |
| 88H        | 40H         | BR_INST_EXEC.TAKEN              | Counts taken near branches executed, but not necessarily retired.   |         |
| 88H        | 7FH         | BR_INST_EXEC.ANY                | Counts all near executed branches (not necessarily retired). This includes only instructions and not micro-op branches. Frequent branching is not necessarily a major performance issue. However frequent branch mispredictions may be a problem. |         |
| 89H        | 01H         | BR_MISP_EXEC.COND               | Counts the number of mispredicted conditional near branch instructions executed, but not necessarily retired.   |         |
| 89H        | 02H         | BR_MISP_EXEC.DIRECT             | Counts mispredicted macro unconditional near branch instructions, excluding calls and indirect branches (should always be 0).   |         |
| 89H        | 04H         | BR_MISP_EXEC.INDIRECT_NON_CALL  | Counts the number of executed mispredicted indirect near branch instructions that are not calls.  |         |
| 89H        | 07H         | BR_MISP_EXEC.NON_CALLS          | Counts mispredicted non-call near branches executed, but not necessarily retired.   |         |
| 89H        | 08H         | BR_MISP_EXEC.RETURN_NEAR        | Counts mispredicted indirect branches that have a near return mnemonic.   |         |
| 89H        | 10H         | BR_MISP_EXEC.DIRECT_NEAR_CALL   | Counts mispredicted non-indirect near calls executed, (should always be 0).   |         |
| 89H        | 20H         | BR_MISP_EXEC.INDIRECT_NEAR_CALL | Counts mispredicted indirect near calls executed, including both register and memory indirect.  |         |
| 89H        | 30H         | BR_MISP_EXEC.NEAR_CALLS         | Counts all mispredicted near call branches executed, but not necessarily retired.   |         |
| 89H        | 40H         | BR_MISP_EXEC.TAKEN              | Counts executed mispredicted near branches that are taken, but not necessarily retired.   |         |
| 89H        | 7FH         | BR_MISP_EXEC.ANY                | Counts the number of mispredicted near branch instructions that were executed, but not necessarily retired.   |         |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic         | Description  | Comment   |
|------------|-------------|-----------------------------|--|---|
| A2H        | 01H         | RESOURCE_STALLS.ANY         | Counts the number of Allocator resource related stalls. Includes register renaming buffer entries, memory buffer entries. In addition to resource related stalls, this event counts some other events. Includes stalls arising during branch misprediction recovery, such as if retirement of the mispredicted branch is delayed and stalls arising while store buffer is draining from synchronizing operations.  | Does not include stalls due to SuperQ (off core) queue full, too many cache misses, etc.    |
| A2H        | 02H         | RESOURCE_STALLS.LOAD        | Counts the cycles of stall due to lack of load buffer for load operation.  |   |
| A2H        | 04H         | RESOURCE_STALLS.RS_FULL     | This event counts the number of cycles when the number of instructions in the pipeline waiting for execution reaches the limit the processor can handle. A high count of this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, or instructions dependent upon instructions further down the pipeline that have yet to retire.  | When RS is full, new instructions cannot enter the reservation station and start execution. |
| A2H        | 08H         | RESOURCE_STALLS.STORE       | This event counts the number of cycles that a resource related stall will occur due to the number of store instructions reaching the limit of the pipeline, (i.e. all store buffers are used). The stall ends when a store instruction commits its data to the cache or memory.  |   |
| A2H        | 10H         | RESOURCE_STALLS.ROB_FULL    | Counts the cycles of stall due to re-order buffer full.  |   |
| A2H        | 20H         | RESOURCE_STALLS.FPCW        | Counts the number of cycles while execution was stalled due to writing the floating-point unit (FPU) control word.   |   |
| A2H        | 40H         | RESOURCE_STALLS.MXCSR       | Stalls due to the MXCSR register rename occurring too close to a previous MXCSR rename. The MXCSR provides control and status for the MMX registers.   |   |
| A2H        | 80H         | RESOURCE_STALLS.OTHER       | Counts the number of cycles while execution was stalled due to other resource issues.  |   |
| A6H        | 01H         | MACRO_INSTS.FUSIONS_DECODED | Counts the number of instructions decoded that are macro-fused but not necessarily executed or retired.  |   |
| A7H        | 01H         | BACLEAR_FORCE_IQ            | Counts number of times a BACLEAR was forced by the Instruction Queue. The IQ is also responsible for providing conditional branch prediction direction based on a static scheme and dynamic data provided by the L2 Branch Prediction Unit. If the conditional branch target is not found in the Target Array and the IQ predicts that the branch is taken, then the IQ will force the Branch Address Calculator to issue a BACLEAR. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline. |   |
| A8H        | 01H         | LSD.UOPS                    | Counts the number of micro-ops delivered by loop stream detector.  | Use cmask=1 and invert to count cycles.   |
| AEH        | 01H         | ITLB_FLUSH                  | Counts the number of ITLB flushes.   |   |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                       | Description  | Comment                                      |
|------------|-------------|---|--|--|
| B0H        | 40H         | OFFCORE_REQUESTS.L1D_WRITEBACK            | Counts number of L1D writebacks to the uncore.   |  |
| B1H        | 01H         | UOPS_EXECUTED.PORT0                       | Counts number of uops executed that were issued on port 0. Port 0 handles integer arithmetic, SIMD and FP add uops.  |  |
| B1H        | 02H         | UOPS_EXECUTED.PORT1                       | Counts number of uops executed that were issued on port 1. Port 1 handles integer arithmetic, SIMD, integer shift, FP multiply and FP divide uops.   |  |
| B1H        | 04H         | UOPS_EXECUTED.PORT2_CORE                  | Counts number of uops executed that were issued on port 2. Port 2 handles the load uops. This is a core count only and cannot be collected per thread.   |  |
| B1H        | 08H         | UOPS_EXECUTED.PORT3_CORE                  | Counts number of uops executed that were issued on port 3. Port 3 handles store uops. This is a core count only and cannot be collected per thread.  |  |
| B1H        | 10H         | UOPS_EXECUTED.PORT4_CORE                  | Counts number of uops executed that where issued on port 4. Port 4 handles the value to be stored for the store uops issued on port 3. This is a core count only and cannot be collected per thread.   |  |
| B1H        | 1FH         | UOPS_EXECUTED.CORE_ACTIVE_CYCLES_NO_PORT5 | Counts cycles when the uops executed were issued from any ports except port 5. Use Cmask=1 for active cycles; Cmask=0 for weighted cycles. Use CMask=1, Invert=1 to count P0-4 stalled cycles. Use Cmask=1, Edge=1, Invert=1 to count P0-4 stalls. |  |
| B1H        | 20H         | UOPS_EXECUTED.PORT5                       | Counts number of uops executed that where issued on port 5.  |  |
| B1H        | 3FH         | UOPS_EXECUTED.CORE_ACTIVE_CYCLES          | Counts cycles when the uops are executing. Use Cmask=1 for active cycles; Cmask=0 for weighted cycles. Use CMask=1, Invert=1 to count P0-4 stalled cycles. Use Cmask=1, Edge=1, Invert=1 to count P0-4 stalls.                                     |  |
| B1H        | 40H         | UOPS_EXECUTED.PORT015                     | Counts number of uops executed that where issued on port 0, 1, or 5.   | Use cmask=1, invert=1 to count stall cycles. |
| B1H        | 80H         | UOPS_EXECUTED.PORT234                     | Counts number of uops executed that where issued on port 2, 3, or 4.   |  |
| B2H        | 01H         | OFFCORE_REQUESTS_SQ_FULL                  | Counts number of cycles the SQ is full to handle off-core requests.  |  |
| B7H        | 01H         | OFF_CORE_RESPONSE_0                       | See Section 18.3.1.1.3, "Off-core Response Performance Monitoring in the Processor Core".  | Requires programming MSR 01A6H.              |
| B8H        | 01H         | SNOOP_RESPONSE.HIT                        | Counts HIT snoop response sent by this thread in response to a snoop request.  |  |
| B8H        | 02H         | SNOOP_RESPONSE.HITE                       | Counts HIT E snoop response sent by this thread in response to a snoop request.  |  |
| B8H        | 04H         | SNOOP_RESPONSE.HITM                       | Counts HIT M snoop response sent by this thread in response to a snoop request.  |  |
| BBH        | 01H         | OFF_CORE_RESPONSE_1                       | See Section 18.6.3, "Performance Monitoring (Processors Based on Intel NetBurst® Microarchitecture)".  | Requires programming MSR 01A7H.              |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic             | Description   | Comment  |
|------------|-------------|---------------------------------|---|--|
| C0H        | 00H         | INST_RETIRED.ANY_P              | See Table 19-1.<br>Notes: INST_RETIRED.ANY is counted by a designated fixed counter. INST_RETIRED.ANY_P is counted by a programmable counter and is an architectural performance event. Event is supported if CPUID.A.EBX[1] = 0.   | Counting: Faulting executions of GETSEC/VM entry/VM Exit/MWait will not count as retired instructions. |
| C0H        | 02H         | INST_RETIRED.X87                | Counts the number of MMX instructions retired.  |  |
| C0H        | 04H         | INST_RETIRED.MMX                | Counts the number of floating point computational operations retired: floating point computational operations executed by the assist handler and sub-operations of complex floating point instructions like transcendental instructions.  |  |
| C2H        | 01H         | UOPS_RETIRED.ANY                | Counts the number of micro-ops retired, (macro-fused=1, micro-fused=2, others=1; maximum count of 8 per cycle). Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists. | Use cmask=1 and invert to count active cycles or stalled cycles.                                       |
| C2H        | 02H         | UOPS_RETIRED.RETIRE_SLOTS       | Counts the number of retirement slots used each cycle.  |  |
| C2H        | 04H         | UOPS_RETIRED.MACRO_FUSED        | Counts number of macro-fused uops retired.  |  |
| C3H        | 01H         | MACHINE_CLEAR.CYCLES            | Counts the cycles machine clear is asserted.  |  |
| C3H        | 02H         | MACHINE_CLEAR.MEM_ORDER         | Counts the number of machine clears due to memory order conflicts.  |  |
| C3H        | 04H         | MACHINE_CLEAR.SMC               | Counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel 64 and IA-32 processors. The modified cache line is written back to the L2 and L3 caches.  |  |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES    | Branch instructions at retirement.  | See Table 19-1.  |
| C4H        | 01H         | BR_INST_RETIRED.CONDITIONAL     | Counts the number of conditional branch instructions retired.   |  |
| C4H        | 02H         | BR_INST_RETIRED.NEAR_CALL       | Counts the number of direct & indirect near unconditional calls retired.  |  |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANCHES    | Mispredicted branch instructions at retirement.   | See Table 19-1.  |
| C5H        | 02H         | BR_MISP_RETIRED.NEAR_CALL       | Counts mispredicted direct & indirect near unconditional retired calls.   |  |
| C7H        | 01H         | SSEX_UOPS_RETIRED.PACKED_SINGLE | Counts SIMD packed single-precision floating point Uops retired.  |  |
| C7H        | 02H         | SSEX_UOPS_RETIRED.SCALAR_SINGLE | Counts SIMD scalar single-precision floating point Uops retired.  |  |
| C7H        | 04H         | SSEX_UOPS_RETIRED.PACKED_DOUBLE | Counts SIMD packed double-precision floating point Uops retired.  |  |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                     | Description   | Comment |
|------------|-------------|---|---|---------|
| C7H        | 08H         | SSEX_UOPS_RETIRED.SCALAR_DOUBLE         | Counts SIMD scalar double-precision floating point Uops retired.  |         |
| C7H        | 10H         | SSEX_UOPS_RETIRED.VECTOR_INTEGER        | Counts 128-bit SIMD vector integer Uops retired.  |         |
| C8H        | 20H         | ITLB_MISS_RETIRED                       | Counts the number of retired instructions that missed the ITLB when the instruction was fetched.  |         |
| CBH        | 01H         | MEM_LOAD_RETIRED.L1D_HIT                | Counts number of retired loads that hit the L1 data cache.  |         |
| CBH        | 02H         | MEM_LOAD_RETIRED.L2_HIT                 | Counts number of retired loads that hit the L2 data cache.  |         |
| CBH        | 04H         | MEM_LOAD_RETIRED.L3_UNSHARED_HIT        | Counts number of retired loads that hit their own, unshared lines in the L3 cache.  |         |
| CBH        | 08H         | MEM_LOAD_RETIRED.OTHER_CORE_L2_HIT_HITM | Counts number of retired loads that hit in a sibling core's L2 (on die core). Since the L3 is inclusive of all cores on the package, this is an L3 hit. This counts both clean and modified hits.   |         |
| CBH        | 10H         | MEM_LOAD_RETIRED.L3_MISS                | Counts number of retired loads that miss the L3 cache. The load was satisfied by a remote socket, local memory or an IOH.   |         |
| CBH        | 40H         | MEM_LOAD_RETIRED.HIT_LFB                | Counts number of retired loads that miss the L1D and the address is located in an allocated line fill buffer and will soon be committed to cache. This is counting secondary L1D misses.  |         |
| CBH        | 80H         | MEM_LOAD_RETIRED.DTLB_MISS              | Counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. Counts both primary and secondary misses to the TLB. |         |
| CCH        | 01H         | FP_MMX_TRANS.TO_FP                      | Counts the first floating-point instruction following any MMX instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.   |         |
| CCH        | 02H         | FP_MMX_TRANS.TO_MMX                     | Counts the first MMX instruction following a floating-point instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.   |         |
| CCH        | 03H         | FP_MMX_TRANS.ANY                        | Counts all transitions from floating point to MMX instructions and from MMX instructions to floating point instructions. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.   |         |
| D0H        | 01H         | MACRO_INSTS.DECODED                     | Counts the number of instructions decoded, (but not necessarily executed or retired).   |         |
| D1H        | 02H         | UOPS_DECODED.MS                         | Counts the number of Uops decoded by the Microcode Sequencer, MS. The MS delivers uops when the instruction is more than 4 uops long or a microcode assist is occurring.  |         |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic      | Description   | Comment |
|------------|-------------|--------------------------|---|---------|
| D1H        | 04H         | UOPS_DECODED.ESP_FOLDING | Counts number of stack pointer (ESP) instructions decoded: push, pop, call, ret, etc. ESP instructions do not generate a Uop to increment or decrement ESP. Instead, they update an ESP_Offset register that keeps track of the delta to the current value of the ESP register.   |         |
| D1H        | 08H         | UOPS_DECODED.ESP_SYNC    | Counts number of stack pointer (ESP) sync operations where an ESP instruction is corrected by adding the ESP offset register to the current value of the ESP register.  |         |
| D2H        | 01H         | RAT_STALLS.FLAGS         | Counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall. A partial register stall may occur when two conditions are met: 1) an instruction modifies some, but not all, of the flags in the flag register and 2) the next instruction, which depends on flags, depends on flags that were not modified by this instruction.   |         |
| D2H        | 02H         | RAT_STALLS.REGISTERS     | This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction used a register that was partially written by previous instruction.   |         |
| D2H        | 04H         | RAT_STALLS.ROB_READ_PORT | Counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline. Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read port stall is counted again.   |         |
| D2H        | 08H         | RAT_STALLS.SCOREBOARD    | Counts the cycles where we stall due to microarchitecturally required serialization. Microcode scoreboarding stalls.  |         |
| D2H        | 0FH         | RAT_STALLS.ANY           | Counts all Register Allocation Table stall cycles due to: Cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the execution pipe. Cycles when partial register stalls occurred. Cycles when flag stalls occurred. Cycles floating-point unit (FPU) status word stalls occurred. To count each of these conditions separately use the events: RAT_STALLS.ROB_READ_PORT, RAT_STALLS.PARTIAL, RAT_STALLS.FLAGS, and RAT_STALLS.FPSW. |         |
| D4H        | 01H         | SEG_RENAME_STALLS        | Counts the number of stall cycles due to the lack of renaming resources for the ES, DS, FS, and GS segment registers. If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.  |         |
| D5H        | 01H         | ES_REG_RENAMES           | Counts the number of times the ES segment register is renamed.  |         |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic       | Description  | Comment   |
|------------|-------------|---------------------------|--|---|
| DBH        | 01H         | UOP_UNFUSION              | Counts unfusion events due to floating-point exception to a fused uop.   |   |
| E0H        | 01H         | BR_INST_DECODED           | Counts the number of branch instructions decoded.  |   |
| E5H        | 01H         | BPU_MISSED_CALL_RET       | Counts number of times the Branch Prediction Unit missed predicting a call or return branch.   |   |
| E6H        | 01H         | BACLEAR.CLEAR             | Counts the number of times the front end is resteeered, mainly when the Branch Prediction Unit cannot provide a correct prediction and this is corrected by the Branch Address Calculator at the front end. This can occur if the code has many branches such that they cannot be consumed by the BPU. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline. The effect on total execution time depends on the surrounding code. |   |
| E6H        | 02H         | BACLEAR.BAD_TARGET        | Counts number of Branch Address Calculator clears (BACLEAR) asserted due to conditional branch instructions in which there was a target hit but the direction was wrong. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.   |   |
| E8H        | 01H         | BPU_CLEAR.EARLY           | Counts early (normal) Branch Prediction Unit clears: BPU predicted a taken branch after incorrectly assuming that it was not taken.  | The BPU clear leads to 2 cycle bubble in the front end. |
| E8H        | 02H         | BPU_CLEAR.LATE            | Counts late Branch Prediction Unit clears due to Most Recently Used conflicts. The PBU clear leads to a 3 cycle bubble in the front end.   |   |
| F0H        | 01H         | L2_TRANSACTIONS.LOAD      | Counts L2 load operations due to HW prefetch or demand loads.  |   |
| F0H        | 02H         | L2_TRANSACTIONS.RFO       | Counts L2 RFO operations due to HW prefetch or demand RFOs.  |   |
| F0H        | 04H         | L2_TRANSACTIONS.IFETCH    | Counts L2 instruction fetch operations due to HW prefetch or demand ifetch.  |   |
| F0H        | 08H         | L2_TRANSACTIONS.PREFETCH  | Counts L2 prefetch operations.   |   |
| F0H        | 10H         | L2_TRANSACTIONS.L1D_WB    | Counts L1D writeback operations to the L2.   |   |
| F0H        | 20H         | L2_TRANSACTIONS.FILL      | Counts L2 cache line fill operations due to load, RFO, L1D writeback or prefetch.  |   |
| F0H        | 40H         | L2_TRANSACTIONS.WB        | Counts L2 writeback operations to the L3.  |   |
| F0H        | 80H         | L2_TRANSACTIONS.ANY       | Counts all L2 cache operations.  |   |
| F1H        | 02H         | L2_LINES_IN.S_STATE       | Counts the number of cache lines allocated in the L2 cache in the S (shared) state.  |   |
| F1H        | 04H         | L2_LINES_IN.E_STATE       | Counts the number of cache lines allocated in the L2 cache in the E (exclusive) state.   |   |
| F1H        | 07H         | L2_LINES_IN.ANY           | Counts the number of cache lines allocated in the L2 cache.  |   |
| F2H        | 01H         | L2_LINES_OUT.DEMAND_CLEAN | Counts L2 clean cache lines evicted by a demand request.   |   |

**Table 19-19. Performance Events In the Processor Core for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic         | Description  | Comment |
|------------|-------------|-----------------------------|--|---------|
| F2H        | 02H         | L2_LINES_OUT.DEMAND_DIRTY   | Counts L2 dirty (modified) cache lines evicted by a demand request.  |         |
| F2H        | 04H         | L2_LINES_OUT.PREFETCH_CLEAN | Counts L2 clean cache line evicted by a prefetch request.  |         |
| F2H        | 08H         | L2_LINES_OUT.PREFETCH_DIRTY | Counts L2 modified cache line evicted by a prefetch request.   |         |
| F2H        | 0FH         | L2_LINES_OUT.ANY            | Counts all L2 cache lines evicted for any reason.  |         |
| F4H        | 10H         | SQ_MISC.SPLIT_LOCK          | Counts the number of SQ lock splits across a cache line.   |         |
| F6H        | 01H         | SQ_FULL_STALL_CYCLES        | Counts cycles the Super Queue is full. Neither of the threads on this core will be able to access the uncore.  |         |
| F7H        | 01H         | FP_ASSIST.ALL               | Counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases: SSE instructions (denormal input when the DAZ flag is off or underflow result when the FTZ flag is off); x87 instructions (NaN or denormal are loaded to a register or used as input from memory, division by 0 or underflow output). |         |
| F7H        | 02H         | FP_ASSIST.OUTPUT            | Counts number of floating point micro-code assist when the output value (destination register) is invalid.   |         |
| F7H        | 04H         | FP_ASSIST.INPUT             | Counts number of floating point micro-code assist when the input value (one of the source operands to an FP instruction) is invalid.   |         |
| FDH        | 01H         | SIMD_INT_64.PACKED_MPY      | Counts number of SIMD integer 64 bit packed multiply operations.   |         |
| FDH        | 02H         | SIMD_INT_64.PACKED_SHIFT    | Counts number of SIMD integer 64 bit packed shift operations.  |         |
| FDH        | 04H         | SIMD_INT_64.PACK            | Counts number of SIMD integer 64 bit pack operations.  |         |
| FDH        | 08H         | SIMD_INT_64.UNPACK          | Counts number of SIMD integer 64 bit unpack operations.  |         |
| FDH        | 10H         | SIMD_INT_64.PACKED_LOGICAL  | Counts number of SIMD integer 64 bit logical operations.   |         |
| FDH        | 20H         | SIMD_INT_64.PACKED_ARITH    | Counts number of SIMD integer 64 bit arithmetic operations.  |         |
| FDH        | 40H         | SIMD_INT_64.SHUFFLE_MOVE    | Counts number of SIMD integer 64 bit shift or move operations.   |         |

Model-specific performance monitoring events that are located in the uncore sub-system are implementation specific between different platforms using processors based on Intel microarchitecture code name Nehalem. Processors with CPUID signature of DisplayFamily\_DisplayModel 06\_1AH, 06\_1EH, and 06\_1FH support performance events listed in Table 19-20.

**Table 19-20. Performance Events In the Processor Uncore for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series**

| Event Num. | Umask Value | Event Mask Mnemonic                        | Description  | Comment |
|------------|-------------|--|--|---------|
| 00H        | 01H         | UNC_GQ_CYCLES_FULL.READ_TRACKER            | Uncore cycles Global Queue read tracker is full.   |         |
| 00H        | 02H         | UNC_GQ_CYCLES_FULL.WRITE_TRACKER           | Uncore cycles Global Queue write tracker is full.  |         |
| 00H        | 04H         | UNC_GQ_CYCLES_FULL.PEER_PROBE_TRACKER      | Uncore cycles Global Queue peer probe tracker is full. The peer probe tracker queue tracks snoops from the IOH and remote sockets.   |         |
| 01H        | 01H         | UNC_GQ_CYCLES_NOT_EMPTY.READ_TRACKER       | Uncore cycles were Global Queue read tracker has at least one valid entry.   |         |
| 01H        | 02H         | UNC_GQ_CYCLES_NOT_EMPTY.WRITE_TRACKER      | Uncore cycles were Global Queue write tracker has at least one valid entry.  |         |
| 01H        | 04H         | UNC_GQ_CYCLES_NOT_EMPTY.PEER_PROBE_TRACKER | Uncore cycles were Global Queue peer probe tracker has at least one valid entry. The peer probe tracker queue tracks IOH and remote socket snoops.   |         |
| 03H        | 01H         | UNC_GQ_ALLOC.READ_TRACKER                  | Counts the number of read tracker allocate to deallocate entries. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency.   |         |
| 03H        | 02H         | UNC_GQ_ALLOC.RT_L3_MISS                    | Counts the number GQ read tracker entries for which a full cache line read has missed the L3. The GQ read tracker L3 miss to fill occupancy count is divided by this count to obtain the average cache line read L3 miss latency. The latency represents the time after which the L3 has determined that the cache line has missed. The time between a GQ read tracker allocation and the L3 determining that the cache line has missed is the average L3 hit latency. The total L3 cache line read miss latency is the hit latency + L3 miss latency. |         |
| 03H        | 04H         | UNC_GQ_ALLOC.RT_TO_L3_RESP                 | Counts the number of GQ read tracker entries that are allocated in the read tracker queue that hit or miss the L3. The GQ read tracker L3 hit occupancy count is divided by this count to obtain the average L3 hit latency.   |         |
| 03H        | 08H         | UNC_GQ_ALLOC.RT_TO_RTID_ACQUIRED           | Counts the number of GQ read tracker entries that are allocated in the read tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ read tracker L3 miss to RTID acquired occupancy count is divided by this count to obtain the average latency for a read L3 miss to acquire an RTID.  |         |
| 03H        | 10H         | UNC_GQ_ALLOC.WT_TO_RTID_ACQUIRED           | Counts the number of GQ write tracker entries that are allocated in the write tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ write tracker L3 miss to RTID occupancy count is divided by this count to obtain the average latency for a write L3 miss to acquire an RTID.   |         |
| 03H        | 20H         | UNC_GQ_ALLOC.WRITE_TRACKER                 | Counts the number of GQ write tracker entries that are allocated in the write tracker queue that miss the L3. The GQ write tracker occupancy count is divided by this count to obtain the average L3 write miss latency.   |         |

**Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description  | Comment |
|------------|-------------|--|--|---------|
| 03H        | 40H         | UNC_GQ_ALLOC.PEER_PROBE_TRACKER        | Counts the number of GQ peer probe tracker (snoop) entries that are allocated in the peer probe tracker queue that miss the L3. The GQ peer probe occupancy count is divided by this count to obtain the average L3 peer probe miss latency. |         |
| 04H        | 01H         | UNC_GQ_DATA.FROM_QPI                   | Cycles Global Queue Quickpath Interface input data port is busy importing data from the Quickpath Interface. Each cycle the input port can transfer 8 or 16 bytes of data.   |         |
| 04H        | 02H         | UNC_GQ_DATA.FROM_QMC                   | Cycles Global Queue Quickpath Memory Interface input data port is busy importing data from the Quickpath Memory Interface. Each cycle the input port can transfer 8 or 16 bytes of data.   |         |
| 04H        | 04H         | UNC_GQ_DATA.FROM_L3                    | Cycles GQ L3 input data port is busy importing data from the Last Level Cache. Each cycle the input port can transfer 32 bytes of data.  |         |
| 04H        | 08H         | UNC_GQ_DATA.FROM_CORES_02              | Cycles GQ Core 0 and 2 input data port is busy importing data from processor cores 0 and 2. Each cycle the input port can transfer 32 bytes of data.   |         |
| 04H        | 10H         | UNC_GQ_DATA.FROM_CORES_13              | Cycles GQ Core 1 and 3 input data port is busy importing data from processor cores 1 and 3. Each cycle the input port can transfer 32 bytes of data.   |         |
| 05H        | 01H         | UNC_GQ_DATA.TO_QPI_QMC                 | Cycles GQ QPI and QMC output data port is busy sending data to the Quickpath Interface or Quickpath Memory Interface. Each cycle the output port can transfer 32 bytes of data.  |         |
| 05H        | 02H         | UNC_GQ_DATA.TO_L3                      | Cycles GQ L3 output data port is busy sending data to the Last Level Cache. Each cycle the output port can transfer 32 bytes of data.  |         |
| 05H        | 04H         | UNC_GQ_DATA.TO_CORES                   | Cycles GQ Core output data port is busy sending data to the Cores. Each cycle the output port can transfer 32 bytes of data.   |         |
| 06H        | 01H         | UNC_SNP_RESP_TO_LOCAL_HOME.I_STATE     | Number of snoop responses to the local home that L3 does not have the referenced cache line.   |         |
| 06H        | 02H         | UNC_SNP_RESP_TO_LOCAL_HOME.S_STATE     | Number of snoop responses to the local home that L3 has the referenced line cached in the S state.   |         |
| 06H        | 04H         | UNC_SNP_RESP_TO_LOCAL_HOME.FWD_S_STATE | Number of responses to code or data read snoops to the local home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the local home in the S state.    |         |
| 06H        | 08H         | UNC_SNP_RESP_TO_LOCAL_HOME.FWD_I_STATE | Number of responses to read invalidate snoops to the local home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the local home in the M state.                 |         |
| 06H        | 10H         | UNC_SNP_RESP_TO_LOCAL_HOME.CONFLICT    | Number of conflict snoop responses sent to the local home.   |         |

**Table 19-20. Performance Events In the Processor Uncore for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                         | Description   | Comment |
|------------|-------------|---|---|---------|
| 06H        | 20H         | UNC_SNP_RESP_TO_LOCAL_H<br>OME.WB           | Number of responses to code or data read snoops to the local home that the L3 has the referenced line cached in the M state.  |         |
| 07H        | 01H         | UNC_SNP_RESP_TO_REMOTE<br>_HOME.I_STATE     | Number of snoop responses to a remote home that L3 does not have the referenced cache line.   |         |
| 07H        | 02H         | UNC_SNP_RESP_TO_REMOTE<br>_HOME.S_STATE     | Number of snoop responses to a remote home that L3 has the referenced line cached in the S state.   |         |
| 07H        | 04H         | UNC_SNP_RESP_TO_REMOTE<br>_HOME.FWD_S_STATE | Number of responses to code or data read snoops to a remote home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the remote home in the S state. |         |
| 07H        | 08H         | UNC_SNP_RESP_TO_REMOTE<br>_HOME.FWD_I_STATE | Number of responses to read invalidate snoops to a remote home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the remote home in the M state.              |         |
| 07H        | 10H         | UNC_SNP_RESP_TO_REMOTE<br>_HOME.CONFLICT    | Number of conflict snoop responses sent to the local home.  |         |
| 07H        | 20H         | UNC_SNP_RESP_TO_REMOTE<br>_HOME.WB          | Number of responses to code or data read snoops to a remote home that the L3 has the referenced line cached in the M state.   |         |
| 07H        | 24H         | UNC_SNP_RESP_TO_REMOTE<br>_HOME.HITM        | Number of HITM snoop responses to a remote home.  |         |
| 08H        | 01H         | UNC_L3_HITS.READ                            | Number of code read, data read and RFO requests that hit in the L3.   |         |
| 08H        | 02H         | UNC_L3_HITS.WRITE                           | Number of writeback requests that hit in the L3. Writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.   |         |
| 08H        | 04H         | UNC_L3_HITS.PROBE                           | Number of snoops from IOH or remote sockets that hit in the L3.   |         |
| 08H        | 03H         | UNC_L3_HITS.ANY                             | Number of reads and writes that hit the L3.   |         |
| 09H        | 01H         | UNC_L3_MISS.READ                            | Number of code read, data read and RFO requests that miss the L3.   |         |
| 09H        | 02H         | UNC_L3_MISS.WRITE                           | Number of writeback requests that miss the L3. Should always be zero as writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.  |         |
| 09H        | 04H         | UNC_L3_MISS.PROBE                           | Number of snoops from IOH or remote sockets that miss the L3.   |         |
| 09H        | 03H         | UNC_L3_MISS.ANY                             | Number of reads and writes that miss the L3.  |         |
| 0AH        | 01H         | UNC_L3_LINES_IN.M_STATE                     | Counts the number of L3 lines allocated in M state. The only time a cache line is allocated in the M state is when the line was forwarded in M state is forwarded due to a Snoop Read Invalidate Own request.                             |         |
| 0AH        | 02H         | UNC_L3_LINES_IN.E_STATE                     | Counts the number of L3 lines allocated in E state.   |         |
| 0AH        | 04H         | UNC_L3_LINES_IN.S_STATE                     | Counts the number of L3 lines allocated in S state.   |         |

**Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic             | Description   | Comment |
|------------|-------------|---------------------------------|---|---------|
| 0AH        | 08H         | UNC_L3_LINES_IN.F_STATE         | Counts the number of L3 lines allocated in F state.   |         |
| 0AH        | 0FH         | UNC_L3_LINES_IN.ANY             | Counts the number of L3 lines allocated in any state.   |         |
| 0BH        | 01H         | UNC_L3_LINES_OUT.M_STATE        | Counts the number of L3 lines victimized that were in the M state. When the victim cache line is in M state, the line is written to its home cache agent which can be either local or remote. |         |
| 0BH        | 02H         | UNC_L3_LINES_OUT.E_STATE        | Counts the number of L3 lines victimized that were in the E state.  |         |
| 0BH        | 04H         | UNC_L3_LINES_OUT.S_STATE        | Counts the number of L3 lines victimized that were in the S state.  |         |
| 0BH        | 08H         | UNC_L3_LINES_OUT.I_STATE        | Counts the number of L3 lines victimized that were in the I state.  |         |
| 0BH        | 10H         | UNC_L3_LINES_OUT.F_STATE        | Counts the number of L3 lines victimized that were in the F state.  |         |
| 0BH        | 1FH         | UNC_L3_LINES_OUT.ANY            | Counts the number of L3 lines victimized in any state.  |         |
| 20H        | 01H         | UNC_QHL_REQUESTS.IOH_READS      | Counts number of Quickpath Home Logic read requests from the IOH.   |         |
| 20H        | 02H         | UNC_QHL_REQUESTS.IOH_WRITES     | Counts number of Quickpath Home Logic write requests from the IOH.  |         |
| 20H        | 04H         | UNC_QHL_REQUESTS.REMOTE_READS   | Counts number of Quickpath Home Logic read requests from a remote socket.   |         |
| 20H        | 08H         | UNC_QHL_REQUESTS.REMOTE_WRITES  | Counts number of Quickpath Home Logic write requests from a remote socket.  |         |
| 20H        | 10H         | UNC_QHL_REQUESTS.LOCAL_READS    | Counts number of Quickpath Home Logic read requests from the local socket.  |         |
| 20H        | 20H         | UNC_QHL_REQUESTS.LOCAL_WRITES   | Counts number of Quickpath Home Logic write requests from the local socket.   |         |
| 21H        | 01H         | UNC_QHL_CYCLES_FULL.IOH         | Counts uclk cycles all entries in the Quickpath Home Logic IOH are full.  |         |
| 21H        | 02H         | UNC_QHL_CYCLES_FULL.REMOTE      | Counts uclk cycles all entries in the Quickpath Home Logic remote tracker are full.   |         |
| 21H        | 04H         | UNC_QHL_CYCLES_FULL.LOCAL       | Counts uclk cycles all entries in the Quickpath Home Logic local tracker are full.  |         |
| 22H        | 01H         | UNC_QHL_CYCLES_NOT_EMPTY.IOH    | Counts uclk cycles all entries in the Quickpath Home Logic IOH is busy.   |         |
| 22H        | 02H         | UNC_QHL_CYCLES_NOT_EMPTY.REMOTE | Counts uclk cycles all entries in the Quickpath Home Logic remote tracker is busy.  |         |
| 22H        | 04H         | UNC_QHL_CYCLES_NOT_EMPTY.LOCAL  | Counts uclk cycles all entries in the Quickpath Home Logic local tracker is busy.   |         |
| 23H        | 01H         | UNC_QHL_OCCUPANCY.IOH           | QHL IOH tracker allocate to deallocate read occupancy.  |         |
| 23H        | 02H         | UNC_QHL_OCCUPANCY.REMOTE        | QHL remote tracker allocate to deallocate read occupancy.   |         |
| 23H        | 04H         | UNC_QHL_OCCUPANCY.LOCAL         | QHL local tracker allocate to deallocate read occupancy.  |         |

**Table 19-20. Performance Events In the Processor Uncore for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description  | Comment |
|------------|-------------|--------------------------------|--|---------|
| 24H        | 02H         | UNC_QHL_ADDRESS_CONFLICTS.2WAY | Counts number of QHL Active Address Table (AAT) entries that saw a max of 2 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates. |         |
| 24H        | 04H         | UNC_QHL_ADDRESS_CONFLICTS.3WAY | Counts number of QHL Active Address Table (AAT) entries that saw a max of 3 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates. |         |
| 25H        | 01H         | UNC_QHL_CONFLICT_CYCLES.IOH    | Counts cycles the Quickpath Home Logic IOH Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.   |         |
| 25H        | 02H         | UNC_QHL_CONFLICT_CYCLES.REMOTE | Counts cycles the Quickpath Home Logic Remote Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.  |         |
| 25H        | 04H         | UNC_QHL_CONFLICT_CYCLES.LOCAL  | Counts cycles the Quickpath Home Logic Local Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.   |         |
| 26H        | 01H         | UNC_QHL_TO_QMC_BYPASS          | Counts number of requests to the Quickpath Memory Controller that bypass the Quickpath Home Logic. All local accesses can be bypassed. For remote requests, only read requests can be bypassed.  |         |
| 27H        | 01H         | UNC_QMC_NORMAL_FULL.READ.CH0   | Uncore cycles all the entries in the DRAM channel 0 medium or low priority queue are occupied with read requests.  |         |
| 27H        | 02H         | UNC_QMC_NORMAL_FULL.READ.CH1   | Uncore cycles all the entries in the DRAM channel 1 medium or low priority queue are occupied with read requests.  |         |
| 27H        | 04H         | UNC_QMC_NORMAL_FULL.READ.CH2   | Uncore cycles all the entries in the DRAM channel 2 medium or low priority queue are occupied with read requests.  |         |
| 27H        | 08H         | UNC_QMC_NORMAL_FULL.WRITE.CH0  | Uncore cycles all the entries in the DRAM channel 0 medium or low priority queue are occupied with write requests.   |         |
| 27H        | 10H         | UNC_QMC_NORMAL_FULL.WRITE.CH1  | Counts cycles all the entries in the DRAM channel 1 medium or low priority queue are occupied with write requests.   |         |
| 27H        | 20H         | UNC_QMC_NORMAL_FULL.WRITE.CH2  | Uncore cycles all the entries in the DRAM channel 2 medium or low priority queue are occupied with write requests.   |         |
| 28H        | 01H         | UNC_QMC_ISOC_FULL.READ.CH0     | Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous read requests.   |         |
| 28H        | 02H         | UNC_QMC_ISOC_FULL.READ.CH1     | Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous read requests.   |         |

**Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic          | Description  | Comment |
|------------|-------------|------------------------------|--|---------|
| 28H        | 04H         | UNC_QMC_ISOC_FULLL.READ.CH2  | Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous read requests.   |         |
| 28H        | 08H         | UNC_QMC_ISOC_FULLL.WRITE.CH0 | Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous write requests.  |         |
| 28H        | 10H         | UNC_QMC_ISOC_FULLL.WRITE.CH1 | Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous write requests.  |         |
| 28H        | 20H         | UNC_QMC_ISOC_FULLL.WRITE.CH2 | Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous write requests.  |         |
| 29H        | 01H         | UNC_QMC_BUSY.READ.CH0        | Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 0.   |         |
| 29H        | 02H         | UNC_QMC_BUSY.READ.CH1        | Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 1.   |         |
| 29H        | 04H         | UNC_QMC_BUSY.READ.CH2        | Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 2.   |         |
| 29H        | 08H         | UNC_QMC_BUSY.WRITE.CH0       | Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 0.  |         |
| 29H        | 10H         | UNC_QMC_BUSY.WRITE.CH1       | Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 1.  |         |
| 29H        | 20H         | UNC_QMC_BUSY.WRITE.CH2       | Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 2.  |         |
| 2AH        | 01H         | UNC_QMC_OCCUPANCY.CH0        | IMC channel 0 normal read request occupancy.   |         |
| 2AH        | 02H         | UNC_QMC_OCCUPANCY.CH1        | IMC channel 1 normal read request occupancy.   |         |
| 2AH        | 04H         | UNC_QMC_OCCUPANCY.CH2        | IMC channel 2 normal read request occupancy.   |         |
| 2BH        | 01H         | UNC_QMC_ISSOC_OCCUPANCY.CH0  | IMC channel 0 issoc read request occupancy.  |         |
| 2BH        | 02H         | UNC_QMC_ISSOC_OCCUPANCY.CH1  | IMC channel 1 issoc read request occupancy.  |         |
| 2BH        | 04H         | UNC_QMC_ISSOC_OCCUPANCY.CH2  | IMC channel 2 issoc read request occupancy.  |         |
| 2BH        | 07H         | UNC_QMC_ISSOC_READS.ANY      | IMC issoc read request occupancy.  |         |
| 2CH        | 01H         | UNC_QMC_NORMAL_READS.CH0     | Counts the number of Quickpath Memory Controller channel 0 medium and low priority read requests. The QMC channel 0 normal read occupancy divided by this count provides the average QMC channel 0 read latency. |         |

**Table 19-20. Performance Events In the Processor Uncore for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                 | Description  | Comment |
|------------|-------------|-------------------------------------|--|---------|
| 2CH        | 02H         | UNC_QMC_NORMAL_READS.CH1            | Counts the number of Quickpath Memory Controller channel 1 medium and low priority read requests. The QMC channel 1 normal read occupancy divided by this count provides the average QMC channel 1 read latency. |         |
| 2CH        | 04H         | UNC_QMC_NORMAL_READS.CH2            | Counts the number of Quickpath Memory Controller channel 2 medium and low priority read requests. The QMC channel 2 normal read occupancy divided by this count provides the average QMC channel 2 read latency. |         |
| 2CH        | 07H         | UNC_QMC_NORMAL_READS.ANY            | Counts the number of Quickpath Memory Controller medium and low priority read requests. The QMC normal read occupancy divided by this count provides the average QMC read latency.                               |         |
| 2DH        | 01H         | UNC_QMC_HIGH_PRIORITY_READS.CH0     | Counts the number of Quickpath Memory Controller channel 0 high priority isochronous read requests.  |         |
| 2DH        | 02H         | UNC_QMC_HIGH_PRIORITY_READS.CH1     | Counts the number of Quickpath Memory Controller channel 1 high priority isochronous read requests.  |         |
| 2DH        | 04H         | UNC_QMC_HIGH_PRIORITY_READS.CH2     | Counts the number of Quickpath Memory Controller channel 2 high priority isochronous read requests.  |         |
| 2DH        | 07H         | UNC_QMC_HIGH_PRIORITY_READS.ANY     | Counts the number of Quickpath Memory Controller high priority isochronous read requests.  |         |
| 2EH        | 01H         | UNC_QMC_CRITICAL_PRIORITY_READS.CH0 | Counts the number of Quickpath Memory Controller channel 0 critical priority isochronous read requests.  |         |
| 2EH        | 02H         | UNC_QMC_CRITICAL_PRIORITY_READS.CH1 | Counts the number of Quickpath Memory Controller channel 1 critical priority isochronous read requests.  |         |
| 2EH        | 04H         | UNC_QMC_CRITICAL_PRIORITY_READS.CH2 | Counts the number of Quickpath Memory Controller channel 2 critical priority isochronous read requests.  |         |
| 2EH        | 07H         | UNC_QMC_CRITICAL_PRIORITY_READS.ANY | Counts the number of Quickpath Memory Controller critical priority isochronous read requests.  |         |
| 2FH        | 01H         | UNC_QMC_WRITES.FULL.CH0             | Counts number of full cache line writes to DRAM channel 0.   |         |
| 2FH        | 02H         | UNC_QMC_WRITES.FULL.CH1             | Counts number of full cache line writes to DRAM channel 1.   |         |
| 2FH        | 04H         | UNC_QMC_WRITES.FULL.CH2             | Counts number of full cache line writes to DRAM channel 2.   |         |
| 2FH        | 07H         | UNC_QMC_WRITES.FULL.ANY             | Counts number of full cache line writes to DRAM.   |         |
| 2FH        | 08H         | UNC_QMC_WRITES.PARTIAL.CH0          | Counts number of partial cache line writes to DRAM channel 0.  |         |
| 2FH        | 10H         | UNC_QMC_WRITES.PARTIAL.CH1          | Counts number of partial cache line writes to DRAM channel 1.  |         |
| 2FH        | 20H         | UNC_QMC_WRITES.PARTIAL.CH2          | Counts number of partial cache line writes to DRAM channel 2.  |         |
| 2FH        | 38H         | UNC_QMC_WRITES.PARTIAL.ANY          | Counts number of partial cache line writes to DRAM.  |         |
| 30H        | 01H         | UNC_QMC_CANCEL.CH0                  | Counts number of DRAM channel 0 cancel requests.   |         |
| 30H        | 02H         | UNC_QMC_CANCEL.CH1                  | Counts number of DRAM channel 1 cancel requests.   |         |

**Table 19-20. Performance Events In the Processor Uncore for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                             | Description   | Comment |
|------------|-------------|---|---|---------|
| 30H        | 04H         | UNC_QMC_CANCEL.CH2                              | Counts number of DRAM channel 2 cancel requests.  |         |
| 30H        | 07H         | UNC_QMC_CANCEL.ANY                              | Counts number of DRAM cancel requests.  |         |
| 31H        | 01H         | UNC_QMC_PRIORITY_UPDATE<br>S.CH0                | Counts number of DRAM channel 0 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request. |         |
| 31H        | 02H         | UNC_QMC_PRIORITY_UPDATE<br>S.CH1                | Counts number of DRAM channel 1 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request. |         |
| 31H        | 04H         | UNC_QMC_PRIORITY_UPDATE<br>S.CH2                | Counts number of DRAM channel 2 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request. |         |
| 31H        | 07H         | UNC_QMC_PRIORITY_UPDATE<br>S.ANY                | Counts number of DRAM priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.           |         |
| 33H        | 04H         | UNC_QHL_FRC_ACK_CNFLT.S.<br>LOCAL               | Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the local home.  |         |
| 40H        | 01H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.HOME.LINK_0  | Counts cycles the Quickpath outbound link 0 HOME virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.   |         |
| 40H        | 02H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.SNOOP.LINK_0 | Counts cycles the Quickpath outbound link 0 SNOOP virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.  |         |
| 40H        | 04H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.NDR.LINK_0   | Counts cycles the Quickpath outbound link 0 non-data response virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                                      |         |
| 40H        | 08H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.HOME.LINK_1  | Counts cycles the Quickpath outbound link 1 HOME virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.   |         |

| 40H        | 38H         | UNC_QPI_TX_STALLED_SINGLE_FLIT.LINK_1       | Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                    |         |
| 41H        | 01H         | UNC_QPI_TX_STALLED_MULTIFLIT.DRS.LINK_0     | Counts cycles the Quickpath outbound link 0 Data Response virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.         |         |
| 41H        | 02H         | UNC_QPI_TX_STALLED_MULTIFLIT.NCB.LINK_0     | Counts cycles the Quickpath outbound link 0 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.   |         |
| 41H        | 04H         | UNC_QPI_TX_STALLED_MULTIFLIT.NCS.LINK_0     | Counts cycles the Quickpath outbound link 0 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated. |         |
| 41H        | 08H         | UNC_QPI_TX_STALLED_MULTIFLIT.DRS.LINK_1     | Counts cycles the Quickpath outbound link 1 Data Response virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.         |         |
| 41H        | 10H         | UNC_QPI_TX_STALLED_MULTIFLIT.NCB.LINK_1     | Counts cycles the Quickpath outbound link 1 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.   |         |

**Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                      | Description   | Comment |
|------------|-------------|--|---|---------|
| 41H        | 20H         | UNC_QPI_TX_STALLED_MULTI_FLIT.NCS.LINK_1 | Counts cycles the Quickpath outbound link 1 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated. |         |
| 41H        | 07H         | UNC_QPI_TX_STALLED_MULTI_FLIT.LINK_0     | Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                     |         |
| 41H        | 38H         | UNC_QPI_TX_STALLED_MULTI_FLIT.LINK_1     | Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                     |         |
| 42H        | 02H         | UNC_QPI_TX_HEADER.BUSY.LINK_0            | Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is busy.   |         |
| 42H        | 08H         | UNC_QPI_TX_HEADER.BUSY.LINK_1            | Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is busy.   |         |
| 43H        | 01H         | UNC_QPI_RX_NO_PPT_CREDIT.STALLS.LINK_0   | Number of cycles that snoop packets incoming to the Quickpath Interface link 0 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.  |         |
| 43H        | 02H         | UNC_QPI_RX_NO_PPT_CREDIT.STALLS.LINK_1   | Number of cycles that snoop packets incoming to the Quickpath Interface link 1 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.  |         |
| 60H        | 01H         | UNC_DRAM_OPEN.CH0                        | Counts number of DRAM Channel 0 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.  |         |
| 60H        | 02H         | UNC_DRAM_OPEN.CH1                        | Counts number of DRAM Channel 1 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.  |         |
| 60H        | 04H         | UNC_DRAM_OPEN.CH2                        | Counts number of DRAM Channel 2 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.  |         |
| 61H        | 01H         | UNC_DRAM_PAGE_CLOSE.CH0                  | DRAM channel 0 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.   |         |
| 61H        | 02H         | UNC_DRAM_PAGE_CLOSE.CH1                  | DRAM channel 1 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.   |         |
| 61H        | 04H         | UNC_DRAM_PAGE_CLOSE.CH2                  | DRAM channel 2 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.   |         |

**Table 19-20. Performance Events In the Processor Uncore for  
Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic             | Description   | Comment |
|------------|-------------|---------------------------------|---|---------|
| 62H        | 01H         | UNC_DRAM_PAGE_MISS.CH0          | Counts the number of precharges (PRE) that were issued to DRAM channel 0 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge. |         |
| 62H        | 02H         | UNC_DRAM_PAGE_MISS.CH1          | Counts the number of precharges (PRE) that were issued to DRAM channel 1 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge. |         |
| 62H        | 04H         | UNC_DRAM_PAGE_MISS.CH2          | Counts the number of precharges (PRE) that were issued to DRAM channel 2 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge. |         |
| 63H        | 01H         | UNC_DRAM_READ_CAS.CH0           | Counts the number of times a read CAS command was issued on DRAM channel 0.   |         |
| 63H        | 02H         | UNC_DRAM_READ_CAS.AUTO PRE_CH0  | Counts the number of times a read CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 63H        | 04H         | UNC_DRAM_READ_CAS.CH1           | Counts the number of times a read CAS command was issued on DRAM channel 1.   |         |
| 63H        | 08H         | UNC_DRAM_READ_CAS.AUTO PRE_CH1  | Counts the number of times a read CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 63H        | 10H         | UNC_DRAM_READ_CAS.CH2           | Counts the number of times a read CAS command was issued on DRAM channel 2.   |         |
| 63H        | 20H         | UNC_DRAM_READ_CAS.AUTO PRE_CH2  | Counts the number of times a read CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 64H        | 01H         | UNC_DRAM_WRITE_CAS.CH0          | Counts the number of times a write CAS command was issued on DRAM channel 0.  |         |
| 64H        | 02H         | UNC_DRAM_WRITE_CAS.AUTO PRE_CH0 | Counts the number of times a write CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.  |         |
| 64H        | 04H         | UNC_DRAM_WRITE_CAS.CH1          | Counts the number of times a write CAS command was issued on DRAM channel 1.  |         |
| 64H        | 08H         | UNC_DRAM_WRITE_CAS.AUTO PRE_CH1 | Counts the number of times a write CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.  |         |
| 64H        | 10H         | UNC_DRAM_WRITE_CAS.CH2          | Counts the number of times a write CAS command was issued on DRAM channel 2.  |         |

**Table 19-20. Performance Events In the Processor Uncore for Intel® Core™ i7 Processor and Intel® Xeon® Processor 5500 Series (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic             | Description  | Comment |
|------------|-------------|---------------------------------|--|---------|
| 64H        | 20H         | UNC_DRAM_WRITE_CAS.AUTO PRE_CH2 | Counts the number of times a write CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 65H        | 01H         | UNC_DRAM_REFRESH.CH0            | Counts number of DRAM channel 0 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.                   |         |
| 65H        | 02H         | UNC_DRAM_REFRESH.CH1            | Counts number of DRAM channel 1 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.                   |         |
| 65H        | 04H         | UNC_DRAM_REFRESH.CH2            | Counts number of DRAM channel 2 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.                   |         |
| 66H        | 01H         | UNC_DRAM_PRE_ALL.CH0            | Counts number of DRAM Channel 0 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode. |         |
| 66H        | 02H         | UNC_DRAM_PRE_ALL.CH1            | Counts number of DRAM Channel 1 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode. |         |
| 66H        | 04H         | UNC_DRAM_PRE_ALL.CH2            | Counts number of DRAM Channel 2 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode. |         |

Intel Xeon processors with CPUID signature of DisplayFamily\_DisplayModel 06\_2EH have a distinct uncore sub-system that is significantly different from the uncore found in processors with CPUID signature 06\_1AH, 06\_1EH, and 06\_1FH. Model-specific performance monitoring events for its uncore will be available in future documentation.

## 19.10 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON INTEL® MICROARCHITECTURE CODE NAME WESTMERE

Intel 64 processors based on Intel® microarchitecture code name Westmere support the architectural and model-specific performance monitoring events listed in Table 19-1 and Table 19-21. Table 19-21 applies to processors with CPUID signature of DisplayFamily\_DisplayModel encoding with the following values: 06\_25H, 06\_2CH. In addition, these processors (CPUID signature of DisplayFamily\_DisplayModel 06\_25H, 06\_2CH) also support the following model-specific, product-specific uncore performance monitoring events listed in Table 19-22. Fixed counters support the architecture events defined in Table 19-2.

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere**

| Event Num. | Umask Value | Event Mask Mnemonic                      | Description   | Comment                              |
|------------|-------------|--|---|--------------------------------------|
| 03H        | 02H         | LOAD_BLOCK.OVERLAP_STORE                 | Loads that partially overlap an earlier store.  |                                      |
| 04H        | 07H         | SB_DRAIN.ANY                             | All Store buffer stall cycles.  |                                      |
| 05H        | 02H         | MISALIGN_MEMORY.STORE                    | All store referenced with misaligned address.   |                                      |
| 06H        | 04H         | STORE_BLOCKS.AT_RET                      | Counts number of loads delayed with at-Retirement block code. The following loads need to be executed at retirement and wait for all senior stores on the same thread to be drained: load splitting across 4K boundary (page split), load accessing uncacheable (UC or WC) memory, load lock, and load with page table in UC or WC memory region. |                                      |
| 06H        | 08H         | STORE_BLOCKS.L1D_BLOCK                   | Cacheable loads delayed with L1D block code.  |                                      |
| 07H        | 01H         | PARTIAL_ADDRESS_ALIAS                    | Counts false dependency due to partial address aliasing.  |                                      |
| 08H        | 01H         | DTLB_LOAD_MISSES.ANY                     | Counts all load misses that cause a page walk.  |                                      |
| 08H        | 02H         | DTLB_LOAD_MISSES.WALK_COMPLETED          | Counts number of completed page walks due to load miss in the STLB.   |                                      |
| 08H        | 04H         | DTLB_LOAD_MISSES.WALK_CYCLES             | Cycles PMH is busy with a page walk due to a load miss in the STLB.   |                                      |
| 08H        | 10H         | DTLB_LOAD_MISSES.STLB_HIT                | Number of cache load STLB hits.   |                                      |
| 08H        | 20H         | DTLB_LOAD_MISSES.PDE_MISSES              | Number of DTLB cache load misses where the low part of the linear to physical address translation was missed.   |                                      |
| 0BH        | 01H         | MEM_INST_RETIRED.LOADS                   | Counts the number of instructions with an architecturally-visible load retired on the architected path.   |                                      |
| 0BH        | 02H         | MEM_INST_RETIRED.STORES                  | Counts the number of instructions with an architecturally-visible store retired on the architected path.  |                                      |
| 0BH        | 10H         | MEM_INST_RETIRED.LATENCY_ABOVE_THRESHOLD | Counts the number of instructions exceeding the latency specified with Id_lat facility.   | In conjunction with Id_lat facility. |
| 0CH        | 01H         | MEM_STORE_RETIRED.DTLB_MISS              | The event counts the number of retired stores that missed the DTLB. The DTLB miss is not counted if the store operation causes a fault. Does not counter prefetches. Counts both primary and secondary misses to the TLB.   |                                      |
| 0EH        | 01H         | UOPS_ISSUED.ANY                          | Counts the number of Uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.  |                                      |
| 0EH        | 01H         | UOPS_ISSUED.STALLED_CYCLES               | Counts the number of cycles no uops issued by the Register Allocation Table to the Reservation Station, i.e. the UOPs issued from the front end to the back end.  | Set "invert=1, cmask = 1".           |
| 0EH        | 02H         | UOPS_ISSUED.FUSED                        | Counts the number of fused Uops that were issued from the Register Allocation Table to the Reservation Station.   |                                      |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                                | Description   | Comment                            |
|------------|-------------|--|---|------------------------------------|
| 0FH        | 01H         | MEM_UNCORE_RETIRED.UNKNOWN_SOURCE                  | Load instructions retired with unknown LLC miss (Precise Event).  | Applicable to one and two sockets. |
| 0FH        | 02H         | MEM_UNCORE_RETIRED.OTHER_CORE_L2_HIT               | Load instructions retired that HIT modified data in sibling core (Precise Event).   | Applicable to one and two sockets. |
| 0FH        | 04H         | MEM_UNCORE_RETIRED.REMOTE_HITM                     | Load instructions retired that HIT modified data in remote socket (Precise Event).  | Applicable to two sockets only.    |
| 0FH        | 08H         | MEM_UNCORE_RETIRED.LOCAL_DRAM_AND_REMOTE_CACHE_HIT | Load instructions retired local dram and remote cache HIT data sources (Precise Event).   | Applicable to one and two sockets. |
| 0FH        | 10H         | MEM_UNCORE_RETIRED.REMOTE_DRAM                     | Load instructions retired remote DRAM and remote home-remote cache HITM (Precise Event).  | Applicable to two sockets only.    |
| 0FH        | 20H         | MEM_UNCORE_RETIRED.OTHER_LLC_MISS                  | Load instructions retired other LLC miss (Precise Event).   | Applicable to two sockets only.    |
| 0FH        | 80H         | MEM_UNCORE_RETIRED.UNCACHEABLE                     | Load instructions retired I/O (Precise Event).  | Applicable to one and two sockets. |
| 10H        | 01H         | FP_COMP_OPS_EXE.X87                                | Counts the number of FP Computational Uops Executed. The number of FADD, FSUB, FCOM, FMULs, integer MULs and IMULs, FDIVs, FPREMs, FSQRTS, integer DIVs, and IDIVs. This event does not distinguish an FADD used in the middle of a transcendental flow from a separate FADD instruction. |                                    |
| 10H        | 02H         | FP_COMP_OPS_EXE.MMX                                | Counts number of MMX Uops executed.   |                                    |
| 10H        | 04H         | FP_COMP_OPS_EXE.SSE_FP                             | Counts number of SSE and SSE2 FP uops executed.   |                                    |
| 10H        | 08H         | FP_COMP_OPS_EXE.SSE2_INTEGER                       | Counts number of SSE2 integer uops executed.  |                                    |
| 10H        | 10H         | FP_COMP_OPS_EXE.SSE_FP_PACKED                      | Counts number of SSE FP packed uops executed.   |                                    |
| 10H        | 20H         | FP_COMP_OPS_EXE.SSE_FP_SCALAR                      | Counts number of SSE FP scalar uops executed.   |                                    |
| 10H        | 40H         | FP_COMP_OPS_EXE.SSE_SINGLE_PRECISION               | Counts number of SSE* FP single precision uops executed.  |                                    |
| 10H        | 80H         | FP_COMP_OPS_EXE.SSE_DOUBLE_PRECISION               | Counts number of SSE* FP double precision uops executed.  |                                    |
| 12H        | 01H         | SIMD_INT_128.PACKED_MPY                            | Counts number of 128 bit SIMD integer multiply operations.  |                                    |
| 12H        | 02H         | SIMD_INT_128.PACKED_SHIFT                          | Counts number of 128 bit SIMD integer shift operations.   |                                    |
| 12H        | 04H         | SIMD_INT_128.PACK                                  | Counts number of 128 bit SIMD integer pack operations.  |                                    |
| 12H        | 08H         | SIMD_INT_128.UNPACK                                | Counts number of 128 bit SIMD integer unpack operations.  |                                    |
| 12H        | 10H         | SIMD_INT_128.PACKED_LOGICAL                        | Counts number of 128 bit SIMD integer logical operations.   |                                    |
| 12H        | 20H         | SIMD_INT_128.PACKED_ARITH                          | Counts number of 128 bit SIMD integer arithmetic operations.  |                                    |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic       | Description  | Comment  |
|------------|-------------|---------------------------|--|--|
| 12H        | 40H         | SIMD_INT_128.SHUFFLE_MOVE | Counts number of 128 bit SIMD integer shuffle and move operations.   |  |
| 13H        | 01H         | LOAD_DISPATCH.RS          | Counts number of loads dispatched from the Reservation Station that bypass the Memory Order Buffer.  |  |
| 13H        | 02H         | LOAD_DISPATCH.RS_DELAYED  | Counts the number of delayed RS dispatches at the stage latch. If an RS dispatch cannot bypass to LB, it has another chance to dispatch from the one-cycle delayed staging latch before it is written into the LB.   |  |
| 13H        | 04H         | LOAD_DISPATCH.MOB         | Counts the number of loads dispatched from the Reservation Station to the Memory Order Buffer.   |  |
| 13H        | 07H         | LOAD_DISPATCH.ANY         | Counts all loads dispatched from the Reservation Station.  |  |
| 14H        | 01H         | ARITH.CYCLES_DIV_BUSY     | Counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE. Set 'edge =1, invert=1, cmask=1' to count the number of divides.  | Count may be incorrect When SMT is on.   |
| 14H        | 02H         | ARITH.MUL                 | Counts the number of multiply operations executed. This includes integer as well as floating point multiply operations but excludes DPPS mul and MPSAD.  | Count may be incorrect When SMT is on.   |
| 17H        | 01H         | INST_QUEUE_WRITES         | Counts the number of instructions written into the instruction queue every cycle.  |  |
| 18H        | 01H         | INST_DECODED.DECO         | Counts number of instructions that require decoder 0 to be decoded. Usually, this means that the instruction maps to more than 1 uop.  |  |
| 19H        | 01H         | TWO_UOP_INSTS_DECODED     | An instruction that generates two uops was decoded.  |  |
| 1EH        | 01H         | INST_QUEUE_WRITE_CYCLES   | This event counts the number of cycles during which instructions are written to the instruction queue. Dividing this counter by the number of instructions written to the instruction queue (INST_QUEUE_WRITES) yields the average number of instructions decoded each cycle. If this number is less than four and the pipe stalls, this indicates that the decoder is failing to decode enough instructions per cycle to sustain the 4-wide pipeline. | If SSE* instructions that are 6 bytes or longer arrive one after another, then front end throughput may limit execution speed. |
| 20H        | 01H         | LSD_OVERFLOW              | Number of loops that cannot stream from the instruction queue.   |  |
| 24H        | 01H         | L2_RQSTS.LD_HIT           | Counts number of loads that hit the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches. L2 loads can be rejected for various reasons. Only non rejected loads are counted.  |  |
| 24H        | 02H         | L2_RQSTS.LD_MISS          | Counts the number of loads that miss the L2 cache. L2 loads include both L1D demand misses as well as L1D prefetches.  |  |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic          | Description   | Comment |
|------------|-------------|------------------------------|---|---------|
| 24H        | 03H         | L2_RQSTS.LOADS               | Counts all L2 load requests. L2 loads include both L1D demand misses as well as L1D prefetches.   |         |
| 24H        | 04H         | L2_RQSTS.RFO_HIT             | Counts the number of store RFO requests that hit the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches. Count includes WC memory requests, where the data is not fetched but the permission to write the line is required. |         |
| 24H        | 08H         | L2_RQSTS.RFO_MISS            | Counts the number of store RFO requests that miss the L2 cache. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.   |         |
| 24H        | 0CH         | L2_RQSTS.RFOS                | Counts all L2 store RFO requests. L2 RFO requests include both L1D demand RFO misses as well as L1D RFO prefetches.   |         |
| 24H        | 10H         | L2_RQSTS.IFETCH_HIT          | Counts number of instruction fetches that hit the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.  |         |
| 24H        | 20H         | L2_RQSTS.IFETCH_MISS         | Counts number of instruction fetches that miss the L2 cache. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.   |         |
| 24H        | 30H         | L2_RQSTS.IFETCHES            | Counts all instruction fetches. L2 instruction fetches include both L1I demand misses as well as L1I instruction prefetches.  |         |
| 24H        | 40H         | L2_RQSTS.PREFETCH_HIT        | Counts L2 prefetch hits for both code and data.   |         |
| 24H        | 80H         | L2_RQSTS.PREFETCH_MISS       | Counts L2 prefetch misses for both code and data.   |         |
| 24H        | C0H         | L2_RQSTS.PREFETCHES          | Counts all L2 prefetches for both code and data.  |         |
| 24H        | AAH         | L2_RQSTS.MISS                | Counts all L2 misses for both code and data.  |         |
| 24H        | FFH         | L2_RQSTS.REFERENCES          | Counts all L2 requests for both code and data.  |         |
| 26H        | 01H         | L2_DATA_RQSTS.DEMAND.I_STATE | Counts number of L2 data demand loads where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss. L2 demand loads are both L1D demand misses and L1D prefetches.   |         |
| 26H        | 02H         | L2_DATA_RQSTS.DEMAND.S_STATE | Counts number of L2 data demand loads where the cache line to be loaded is in the S (shared) state. L2 demand loads are both L1D demand misses and L1D prefetches.  |         |
| 26H        | 04H         | L2_DATA_RQSTS.DEMAND.E_STATE | Counts number of L2 data demand loads where the cache line to be loaded is in the E (exclusive) state. L2 demand loads are both L1D demand misses and L1D prefetches.   |         |
| 26H        | 08H         | L2_DATA_RQSTS.DEMAND.M_STATE | Counts number of L2 data demand loads where the cache line to be loaded is in the M (modified) state. L2 demand loads are both L1D demand misses and L1D prefetches.  |         |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description   | Comment                       |
|------------|-------------|--------------------------------|---|-------------------------------|
| 26H        | 0FH         | L2_DATA_RQSTS.DEMAND.MESI      | Counts all L2 data demand requests. L2 demand loads are both L1D demand misses and L1D prefetches.  |                               |
| 26H        | 10H         | L2_DATA_RQSTS.PREFETCH.I_STATE | Counts number of L2 prefetch data loads where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss.  |                               |
| 26H        | 20H         | L2_DATA_RQSTS.PREFETCH.S_STATE | Counts number of L2 prefetch data loads where the cache line to be loaded is in the S (shared) state. A prefetch RFO will miss on an S state line, while a prefetch read will hit on an S state line. |                               |
| 26H        | 40H         | L2_DATA_RQSTS.PREFETCH.E_STATE | Counts number of L2 prefetch data loads where the cache line to be loaded is in the E (exclusive) state.  |                               |
| 26H        | 80H         | L2_DATA_RQSTS.PREFETCH.M_STATE | Counts number of L2 prefetch data loads where the cache line to be loaded is in the M (modified) state.   |                               |
| 26H        | F0H         | L2_DATA_RQSTS.PREFETCH.MESI    | Counts all L2 prefetch requests.  |                               |
| 26H        | FFH         | L2_DATA_RQSTS.ANY              | Counts all L2 data requests.  |                               |
| 27H        | 01H         | L2_WRITE.RFO.I_STATE           | Counts number of L2 demand store RFO requests where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss. The L1D prefetcher does not issue a RFO prefetch.                    | This is a demand RFO request. |
| 27H        | 02H         | L2_WRITE.RFO.S_STATE           | Counts number of L2 store RFO requests where the cache line to be loaded is in the S (shared) state. The L1D prefetcher does not issue a RFO prefetch.  | This is a demand RFO request. |
| 27H        | 08H         | L2_WRITE.RFO.M_STATE           | Counts number of L2 store RFO requests where the cache line to be loaded is in the M (modified) state. The L1D prefetcher does not issue a RFO prefetch.  | This is a demand RFO request. |
| 27H        | 0EH         | L2_WRITE.RFO.HIT               | Counts number of L2 store RFO requests where the cache line to be loaded is in either the S, E or M states. The L1D prefetcher does not issue a RFO prefetch.   | This is a demand RFO request. |
| 27H        | 0FH         | L2_WRITE.RFO.MESI              | Counts all L2 store RFO requests. The L1D prefetcher does not issue a RFO prefetch.   | This is a demand RFO request. |
| 27H        | 10H         | L2_WRITE.LOCK.I_STATE          | Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the I (invalid) state, i.e., a cache miss.   |                               |
| 27H        | 20H         | L2_WRITE.LOCK.S_STATE          | Counts number of L2 lock RFO requests where the cache line to be loaded is in the S (shared) state.   |                               |
| 27H        | 40H         | L2_WRITE.LOCK.E_STATE          | Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the E (exclusive) state.   |                               |
| 27H        | 80H         | L2_WRITE.LOCK.M_STATE          | Counts number of L2 demand lock RFO requests where the cache line to be loaded is in the M (modified) state.  |                               |
| 27H        | E0H         | L2_WRITE.LOCK.HIT              | Counts number of L2 demand lock RFO requests where the cache line to be loaded is in either the S, E, or M state.   |                               |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic              | Description  | Comment            |
|------------|-------------|----------------------------------|--|--------------------|
| 27H        | F0H         | L2_WRITE.LOCK.MESI               | Counts all L2 demand lock RFO requests.  |                    |
| 28H        | 01H         | L1D_WB_L2.I_STATE                | Counts number of L1 writebacks to the L2 where the cache line to be written is in the I (invalid) state, i.e., a cache miss.   |                    |
| 28H        | 02H         | L1D_WB_L2.S_STATE                | Counts number of L1 writebacks to the L2 where the cache line to be written is in the S state.   |                    |
| 28H        | 04H         | L1D_WB_L2.E_STATE                | Counts number of L1 writebacks to the L2 where the cache line to be written is in the E (exclusive) state.   |                    |
| 28H        | 08H         | L1D_WB_L2.M_STATE                | Counts number of L1 writebacks to the L2 where the cache line to be written is in the M (modified) state.  |                    |
| 28H        | 0FH         | L1D_WB_L2.MESI                   | Counts all L1 writebacks to the L2 .   |                    |
| 2EH        | 41H         | L3_LAT_CACHE.MISS                | Counts uncore Last Level Cache misses. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.                                  | See Table 19-1.    |
| 2EH        | 4FH         | L3_LAT_CACHE.REFERENCE           | Counts uncore Last Level Cache references. Because cache hierarchy, cache sizes and other implementation-specific characteristics; value comparison to estimate performance differences is not recommended.                              | See Table 19-1.    |
| 3CH        | 00H         | CPU_CLK_UNHALTED.THREAD_P        | Counts the number of thread cycles while the thread is not in a halt state. The thread enters the halt state when it is running the HLT instruction. The core frequency may change from time to time due to power or thermal throttling. | See Table 19-1.    |
| 3CH        | 01H         | CPU_CLK_UNHALTED.REF_P           | Increments at the frequency of TSC when not halted.  | See Table 19-1.    |
| 49H        | 01H         | DTLB_MISSES.ANY                  | Counts the number of misses in the STLB which causes a page walk.  |                    |
| 49H        | 02H         | DTLB_MISSES.WALK_COMPLETED       | Counts number of misses in the STLB which resulted in a completed page walk.   |                    |
| 49H        | 04H         | DTLB_MISSES.WALK_CYCLES          | Counts cycles of page walk due to misses in the STLB.  |                    |
| 49H        | 10H         | DTLB_MISSES.STLB_HIT             | Counts the number of DTLB first level misses that hit in the second level TLB. This event is only relevant if the core contains multiple DTLB levels.  |                    |
| 49H        | 20H         | DTLB_MISSES.PDE_MISS             | Number of DTLB misses caused by low part of address, includes references to 2M pages because 2M pages do not use the PDE.  |                    |
| 49H        | 80H         | DTLB_MISSES.LARGE_WALK_COMPLETED | Counts number of completed large page walks due to misses in the STLB.   |                    |
| 4CH        | 01H         | LOAD_HIT_PRE                     | Counts load operations sent to the L1 data cache while a previous SSE prefetch instruction to the same cache line has started prefetching but has not yet finished.  | Counter 0, 1 only. |

**Table 19-21. Performance Events In the Processor Core for  
Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                           | Description   | Comment   |
|------------|-------------|---|---|---|
| 4EH        | 01H         | L1D_PREFETCH.REQUESTS                         | Counts number of hardware prefetch requests dispatched out of the prefetch FIFO.  | Counter 0, 1 only.  |
| 4EH        | 02H         | L1D_PREFETCH.MISS                             | Counts number of hardware prefetch requests that miss the L1D. There are two prefetchers in the L1D. A streamer, which predicts lines sequentially after this one should be fetched, and the IP prefetcher that remembers access patterns for the current instruction. The streamer prefetcher stops on an L1D hit, while the IP prefetcher does not. | Counter 0, 1 only.  |
| 4EH        | 04H         | L1D_PREFETCH.TRIGGERS                         | Counts number of prefetch requests triggered by the Finite State Machine and pushed into the prefetch FIFO. Some of the prefetch requests are dropped due to overwrites or competition between the IP index prefetcher and streamer prefetcher. The prefetch FIFO contains 4 entries.   | Counter 0, 1 only.  |
| 4FH        | 10H         | EPT.WALK_CYCLES                               | Counts Extended Page walk cycles.   |   |
| 51H        | 01H         | L1D.REPL                                      | Counts the number of lines brought into the L1 data cache.  | Counter 0, 1 only.  |
| 51H        | 02H         | L1D.M_REPL                                    | Counts the number of modified lines brought into the L1 data cache.   | Counter 0, 1 only.  |
| 51H        | 04H         | L1D.M_EVICT                                   | Counts the number of modified lines evicted from the L1 data cache due to replacement.  | Counter 0, 1 only.  |
| 51H        | 08H         | L1D.M_SNOOP_EVICT                             | Counts the number of modified lines evicted from the L1 data cache due to snoop HITM intervention.  | Counter 0, 1 only.  |
| 52H        | 01H         | L1D_CACHE_PREFETCH_LOCK_FB_HIT                | Counts the number of cacheable load lock speculated instructions accepted into the fill buffer.   |   |
| 60H        | 01H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND.READ_DATA | Counts weighted cycles of offcore demand data read requests. Does not include L2 prefetch requests.   | Counter 0.  |
| 60H        | 02H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND.READ_CODE | Counts weighted cycles of offcore demand code read requests. Does not include L2 prefetch requests.   | Counter 0.  |
| 60H        | 04H         | OFFCORE_REQUESTS_OUTSTANDING.DEMAND.RFO       | Counts weighted cycles of offcore demand RFO requests. Does not include L2 prefetch requests.   | Counter 0.  |
| 60H        | 08H         | OFFCORE_REQUESTS_OUTSTANDING.ANY.READ         | Counts weighted cycles of offcore read requests of any kind. Include L2 prefetch requests.  | Counter 0.  |
| 63H        | 01H         | CACHE_LOCK_CYCLES.L1D_L2                      | Cycle count during which the L1D and L2 are locked. A lock is asserted when there is a locked memory access, due to uncacheable memory, a locked operation that spans two cache lines, or a page walk from an uncacheable page table. This event does not cause locks, it merely detects them.  | Counter 0, 1 only. L1D and L2 locks have a very high performance penalty and it is highly recommended to avoid such accesses. |
| 63H        | 02H         | CACHE_LOCK_CYCLES.L1D                         | Counts the number of cycles that cacheline in the L1 data cache unit is locked.   | Counter 0, 1 only.  |
| 6CH        | 01H         | IO_TRANSACTIONS                               | Counts the number of completed I/O transactions.  |   |
| 80H        | 01H         | L1I.HITS                                      | Counts all instruction fetches that hit the L1 instruction cache.   |   |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic              | Description  | Comment |
|------------|-------------|----------------------------------|--|---------|
| 80H        | 02H         | L1I.MISSES                       | Counts all instruction fetches that miss the L1I cache. This includes instruction cache misses, streaming buffer misses, victim cache misses and uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding. |         |
| 80H        | 03H         | L1I.READS                        | Counts all instruction fetches, including uncacheable fetches that bypass the L1I.   |         |
| 80H        | 04H         | L1I.CYCLES_STALLED               | Cycle counts for which an instruction fetch stalls due to a L1I cache miss, ITLB miss or ITLB fault.   |         |
| 82H        | 01H         | LARGE_ITLB.HIT                   | Counts number of large ITLB hits.  |         |
| 85H        | 01H         | ITLB_MISSES.ANY                  | Counts the number of misses in all levels of the ITLB which causes a page walk.  |         |
| 85H        | 02H         | ITLB_MISSES.WALK_COMPLETED       | Counts number of misses in all levels of the ITLB which resulted in a completed page walk.   |         |
| 85H        | 04H         | ITLB_MISSES.WALK_CYCLES          | Counts ITLB miss page walk cycles.   |         |
| 85H        | 10H         | ITLB_MISSES.STLB_HIT             | Counts number of ITLB first level miss but second level hits.  |         |
| 85H        | 80H         | ITLB_MISSES.LARGE_WALK_COMPLETED | Counts number of completed large page walks due to misses in the STLB.   |         |
| 87H        | 01H         | ILD_STALL.LCP                    | Cycles Instruction Length Decoder stalls due to length changing prefixes: 66, 67 or REX.W (for Intel 64) instructions which change the length of the decoded instruction.  |         |
| 87H        | 02H         | ILD_STALL.MRU                    | Instruction Length Decoder stall cycles due to Branch Prediction Unit (PBU) Most Recently Used (MRU) bypass.   |         |
| 87H        | 04H         | ILD_STALL.IQ_FULL                | Stall cycles due to a full instruction queue.  |         |
| 87H        | 08H         | ILD_STALL.REGEN                  | Counts the number of regen stalls.   |         |
| 87H        | 0FH         | ILD_STALL.ANY                    | Counts any cycles the Instruction Length Decoder is stalled.   |         |
| 88H        | 01H         | BR_INST_EXEC.COND                | Counts the number of conditional near branch instructions executed, but not necessarily retired.   |         |
| 88H        | 02H         | BR_INST_EXEC.DIRECT              | Counts all unconditional near branch instructions excluding calls and indirect branches.   |         |
| 88H        | 04H         | BR_INST_EXEC.INDIRECT_NON_CALL   | Counts the number of executed indirect near branch instructions that are not calls.  |         |
| 88H        | 07H         | BR_INST_EXEC.NON_CALLS           | Counts all non-call near branch instructions executed, but not necessarily retired.  |         |
| 88H        | 08H         | BR_INST_EXEC.RETURN_NEAR         | Counts indirect near branches that have a return mnemonic.   |         |
| 88H        | 10H         | BR_INST_EXEC.DIRECT_NEAR_CALL    | Counts unconditional near call branch instructions, excluding non-call branch, executed.   |         |
| 88H        | 20H         | BR_INST_EXEC.INDIRECT_NEAR_CALL  | Counts indirect near calls, including both register and memory indirect, executed.   |         |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic             | Description   | Comment  |
|------------|-------------|---------------------------------|---|--|
| 88H        | 30H         | BR_INST_EXEC.NEAR_CALLS         | Counts all near call branches executed, but not necessarily retired.  |  |
| 88H        | 40H         | BR_INST_EXEC.TAKEN              | Counts taken near branches executed, but not necessarily retired.   |  |
| 88H        | 7FH         | BR_INST_EXEC.ANY                | Counts all near executed branches (not necessarily retired). This includes only instructions and not micro-op branches. Frequent branching is not necessarily a major performance issue. However frequent branch mispredictions may be a problem.   |  |
| 89H        | 01H         | BR_MISP_EXEC.COND               | Counts the number of mispredicted conditional near branch instructions executed, but not necessarily retired.   |  |
| 89H        | 02H         | BR_MISP_EXEC.DIRECT             | Counts mispredicted macro unconditional near branch instructions, excluding calls and indirect branches (should always be 0).   |  |
| 89H        | 04H         | BR_MISP_EXEC.INDIRECT_NO_N_CALL | Counts the number of executed mispredicted indirect near branch instructions that are not calls.  |  |
| 89H        | 07H         | BR_MISP_EXEC.NON_CALLS          | Counts mispredicted non-call near branches executed, but not necessarily retired.   |  |
| 89H        | 08H         | BR_MISP_EXEC.RETURN_NEAR        | Counts mispredicted indirect branches that have a rear return mnemonic.   |  |
| 89H        | 10H         | BR_MISP_EXEC.DIRECT_NEAR_CALL   | Counts mispredicted non-indirect near calls executed, (should always be 0).   |  |
| 89H        | 20H         | BR_MISP_EXEC.INDIRECT_NEAR_CALL | Counts mispredicted indirect near calls executed, including both register and memory indirect.  |  |
| 89H        | 30H         | BR_MISP_EXEC.NEAR_CALLS         | Counts all mispredicted near call branches executed, but not necessarily retired.   |  |
| 89H        | 40H         | BR_MISP_EXEC.TAKEN              | Counts executed mispredicted near branches that are taken, but not necessarily retired.   |  |
| 89H        | 7FH         | BR_MISP_EXEC.ANY                | Counts the number of mispredicted near branch instructions that were executed, but not necessarily retired.   |  |
| A2H        | 01H         | RESOURCE_STALLS.ANY             | Counts the number of Allocator resource related stalls. Includes register renaming buffer entries, memory buffer entries. In addition to resource related stalls, this event counts some other events. Includes stalls arising during branch misprediction recovery, such as if retirement of the mispredicted branch is delayed and stalls arising while store buffer is draining from synchronizing operations. | Does not include stalls due to SuperQ (off core) queue full, too many cache misses, etc. |
| A2H        | 02H         | RESOURCE_STALLS.LOAD            | Counts the cycles of stall due to lack of load buffer for load operation.   |  |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic               | Description  | Comment   |
|------------|-------------|-----------------------------------|--|---|
| A2H        | 04H         | RESOURCE_STALLS.RS_FULL           | This event counts the number of cycles when the number of instructions in the pipeline waiting for execution reaches the limit the processor can handle. A high count of this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, or instructions dependent upon instructions further down the pipeline that have yet to retire.  | When RS is full, new instructions cannot enter the reservation station and start execution. |
| A2H        | 08H         | RESOURCE_STALLS.STORE             | This event counts the number of cycles that a resource related stall will occur due to the number of store instructions reaching the limit of the pipeline, (i.e. all store buffers are used). The stall ends when a store instruction commits its data to the cache or memory.  |   |
| A2H        | 10H         | RESOURCE_STALLS.ROB_FULL          | Counts the cycles of stall due to re-order buffer full.  |   |
| A2H        | 20H         | RESOURCE_STALLS.FPCW              | Counts the number of cycles while execution was stalled due to writing the floating-point unit (FPU) control word.   |   |
| A2H        | 40H         | RESOURCE_STALLS.MXCSR             | Stalls due to the MXCSR register rename occurring to close to a previous MXCSR rename. The MXCSR provides control and status for the MMX registers.  |   |
| A2H        | 80H         | RESOURCE_STALLS.OTHER             | Counts the number of cycles while execution was stalled due to other resource issues.  |   |
| A6H        | 01H         | MACRO_INSTS.FUSIONS_DECODED       | Counts the number of instructions decoded that are macro-fused but not necessarily executed or retired.  |   |
| A7H        | 01H         | BACLEAR_FORCE_IQ                  | Counts number of times a BACLEAR was forced by the Instruction Queue. The IQ is also responsible for providing conditional branch prediction direction based on a static scheme and dynamic data provided by the L2 Branch Prediction Unit. If the conditional branch target is not found in the Target Array and the IQ predicts that the branch is taken, then the IQ will force the Branch Address Calculator to issue a BACLEAR. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline. |   |
| A8H        | 01H         | LSD.UOPS                          | Counts the number of micro-ops delivered by loop stream detector.  | Use cmask=1 and invert to count cycles.   |
| AEH        | 01H         | ITLB_FLUSH                        | Counts the number of ITLB flushes.   |   |
| B0H        | 01H         | OFFCORE_REQUESTS.DEMAND_READ_DATA | Counts number of offcore demand data read requests. Does not count L2 prefetch requests.   |   |
| B0H        | 02H         | OFFCORE_REQUESTS.DEMAND_READ_CODE | Counts number of offcore demand code read requests. Does not count L2 prefetch requests.   |   |
| B0H        | 04H         | OFFCORE_REQUESTS.DEMAND_READ_RFO  | Counts number of offcore demand RFO requests. Does not count L2 prefetch requests.   |   |
| B0H        | 08H         | OFFCORE_REQUESTS.ANY_READ         | Counts number of offcore read requests. Includes L2 prefetch requests.   |   |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                       | Description  | Comment                                      |
|------------|-------------|---|--|--|
| B0H        | 10H         | OFFCORE_REQUESTS.ANY.RFO                  | Counts number of offcore RFO requests. Includes L2 prefetch requests.  |  |
| B0H        | 40H         | OFFCORE_REQUESTS.L1D_WRITEBACK            | Counts number of L1D writebacks to the uncore.   |  |
| B0H        | 80H         | OFFCORE_REQUESTS.ANY                      | Counts all offcore requests.   |  |
| B1H        | 01H         | UOPS_EXECUTED.PORT0                       | Counts number of uops executed that were issued on port 0. Port 0 handles integer arithmetic, SIMD and FP add uops.  |  |
| B1H        | 02H         | UOPS_EXECUTED.PORT1                       | Counts number of uops executed that were issued on port 1. Port 1 handles integer arithmetic, SIMD, integer shift, FP multiply and FP divide uops.   |  |
| B1H        | 04H         | UOPS_EXECUTED.PORT2_CORE                  | Counts number of uops executed that were issued on port 2. Port 2 handles the load uops. This is a core count only and cannot be collected per thread.   |  |
| B1H        | 08H         | UOPS_EXECUTED.PORT3_CORE                  | Counts number of uops executed that were issued on port 3. Port 3 handles store uops. This is a core count only and cannot be collected per thread.  |  |
| B1H        | 10H         | UOPS_EXECUTED.PORT4_CORE                  | Counts number of uops executed that where issued on port 4. Port 4 handles the value to be stored for the store uops issued on port 3. This is a core count only and cannot be collected per thread. |  |
| B1H        | 1FH         | UOPS_EXECUTED.CORE_ACTIVE_CYCLES_NO_PORT5 | Counts number of cycles there are one or more uops being executed and were issued on ports 0-4. This is a core count only and cannot be collected per thread.  |  |
| B1H        | 20H         | UOPS_EXECUTED.PORT5                       | Counts number of uops executed that where issued on port 5.  |  |
| B1H        | 3FH         | UOPS_EXECUTED.CORE_ACTIVE_CYCLES          | Counts number of cycles there are one or more uops being executed on any ports. This is a core count only and cannot be collected per thread.  |  |
| B1H        | 40H         | UOPS_EXECUTED.PORT015                     | Counts number of uops executed that where issued on port 0, 1, or 5.   | Use cmask=1, invert=1 to count stall cycles. |
| B1H        | 80H         | UOPS_EXECUTED.PORT234                     | Counts number of uops executed that where issued on port 2, 3, or 4.   |  |
| B2H        | 01H         | OFFCORE_REQUESTS_SQ_FULL                  | Counts number of cycles the SQ is full to handle off-core requests.  |  |
| B3H        | 01H         | SNOOPQ_REQUESTS_OUTSTANDING.DATA          | Counts weighted cycles of snoopq requests for data. Counter 0 only.  | Use cmask=1 to count cycles not empty.       |
| B3H        | 02H         | SNOOPQ_REQUESTS_OUTSTANDING.INVALIDATE    | Counts weighted cycles of snoopq invalidate requests. Counter 0 only.  | Use cmask=1 to count cycles not empty.       |
| B3H        | 04H         | SNOOPQ_REQUESTS_OUTSTANDING.CODE          | Counts weighted cycles of snoopq requests for code. Counter 0 only.  | Use cmask=1 to count cycles not empty.       |
| B4H        | 01H         | SNOOPQ_REQUESTS.CODE                      | Counts the number of snoop code requests.  |  |
| B4H        | 02H         | SNOOPQ_REQUESTS.DATA                      | Counts the number of snoop data requests.  |  |
| B4H        | 04H         | SNOOPQ_REQUESTS.INVALIDATE                | Counts the number of snoop invalidate requests.  |  |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic           | Description   | Comment  |
|------------|-------------|-------------------------------|---|--|
| B7H        | 01H         | OFF_CORE_RESPONSE_0           | See Section 18.3.1.1.3, “Off-core Response Performance Monitoring in the Processor Core”.   | Requires programming MSR 01A6H.  |
| B8H        | 01H         | SNOOP_RESPONSE.HIT            | Counts HIT snoop response sent by this thread in response to a snoop request.   |  |
| B8H        | 02H         | SNOOP_RESPONSE.HITE           | Counts HIT E snoop response sent by this thread in response to a snoop request.   |  |
| B8H        | 04H         | SNOOP_RESPONSE.HITM           | Counts HIT M snoop response sent by this thread in response to a snoop request.   |  |
| BBH        | 01H         | OFF_CORE_RESPONSE_1           | See Section 18.3.1.1.3, “Off-core Response Performance Monitoring in the Processor Core”.   | Use MSR 01A7H.   |
| COH        | 00H         | INST_RETIRED.ANY_P            | See Table 19-1.<br>Notes: INST_RETIRED.ANY is counted by a designated fixed counter. INST_RETIRED.ANY_P is counted by a programmable counter and is an architectural performance event. Event is supported if CPUID.A.EBX[1] = 0.   | Counting: Faulting executions of GETSEC/VM entry/VM Exit/MWait will not count as retired instructions. |
| COH        | 02H         | INST_RETIRED.X87              | Counts the number of floating point computational operations retired: floating point computational operations executed by the assist handler and sub-operations of complex floating point instructions like transcendental instructions.  |  |
| COH        | 04H         | INST_RETIRED.MMX              | Counts the number of retired: MMX instructions.   |  |
| C2H        | 01H         | UOPS_RETIRED.ANY              | Counts the number of micro-ops retired, (macro-fused=1, micro-fused=2, others=1; maximum count of 8 per cycle). Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists. | Use cmask=1 and invert to count active cycles or stalled cycles.                                       |
| C2H        | 02H         | UOPS_RETIRED.RETIRE_SLOT S    | Counts the number of retirement slots used each cycle.  |  |
| C2H        | 04H         | UOPS_RETIRED.MACRO_FUSE D     | Counts number of macro-fused uops retired.  |  |
| C3H        | 01H         | MACHINE_CLEAR.S.CYCLES        | Counts the cycles machine clear is asserted.  |  |
| C3H        | 02H         | MACHINE_CLEAR.MEM_ORDE R      | Counts the number of machine clears due to memory order conflicts.  |  |
| C3H        | 04H         | MACHINE_CLEAR.SMC             | Counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel 64 and IA-32 processors. The modified cache line is written back to the L2 and L3caches.   |  |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRAN CHES | Branch instructions at retirement.  | See Table 19-1.  |
| C4H        | 01H         | BR_INST_RETIRED.CONDITION AL  | Counts the number of conditional branch instructions retired.   |  |
| C4H        | 02H         | BR_INST_RETIRED.NEAR_CAL L    | Counts the number of direct & indirect near unconditional calls retired.  |  |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                    | Description   | Comment         |
|------------|-------------|--|---|-----------------|
| C5H        | 00H         | BR_MISP_RETIRE.ALL_BRANCHES            | Mispredicted branch instructions at retirement.   | See Table 19-1. |
| C5H        | 01H         | BR_MISP_RETIRE.CONDITIONAL             | Counts mispredicted conditional retired calls.  |                 |
| C5H        | 02H         | BR_MISP_RETIRE.NEAR_CALL               | Counts mispredicted direct & indirect near unconditional retired calls.   |                 |
| C5H        | 04H         | BR_MISP_RETIRE.ALL_BRANCHES            | Counts all mispredicted retired calls.  |                 |
| C7H        | 01H         | SSEX_UOPS_RETIRE.PACKED_SINGLE         | Counts SIMD packed single-precision floating-point uops retired.  |                 |
| C7H        | 02H         | SSEX_UOPS_RETIRE.SCALAR_SINGLE         | Counts SIMD scalar single-precision floating-point uops retired.  |                 |
| C7H        | 04H         | SSEX_UOPS_RETIRE.PACKED_DOUBLE         | Counts SIMD packed double-precision floating-point uops retired.  |                 |
| C7H        | 08H         | SSEX_UOPS_RETIRE.SCALAR_DOUBLE         | Counts SIMD scalar double-precision floating-point uops retired.  |                 |
| C7H        | 10H         | SSEX_UOPS_RETIRE.VECTOR_INTEGER        | Counts 128-bit SIMD vector integer uops retired.  |                 |
| C8H        | 20H         | ITLB_MISS_RETIRE                       | Counts the number of retired instructions that missed the ITLB when the instruction was fetched.  |                 |
| CBH        | 01H         | MEM_LOAD_RETIRE.L1D_HIT                | Counts number of retired loads that hit the L1 data cache.  |                 |
| CBH        | 02H         | MEM_LOAD_RETIRE.L2_HIT                 | Counts number of retired loads that hit the L2 data cache.  |                 |
| CBH        | 04H         | MEM_LOAD_RETIRE.L3_UNSHARED_HIT        | Counts number of retired loads that hit their own, unshared lines in the L3 cache.  |                 |
| CBH        | 08H         | MEM_LOAD_RETIRE.OTHER_CORE_L2_HIT_HITM | Counts number of retired loads that hit in a sibling core's L2 (on die core). Since the L3 is inclusive of all cores on the package, this is an L3 hit. This counts both clean and modified hits.   |                 |
| CBH        | 10H         | MEM_LOAD_RETIRE.L3_MISS                | Counts number of retired loads that miss the L3 cache. The load was satisfied by a remote socket, local memory or an IOH.   |                 |
| CBH        | 40H         | MEM_LOAD_RETIRE.HIT_LFB                | Counts number of retired loads that miss the L1D and the address is located in an allocated line fill buffer and will soon be committed to cache. This is counting secondary L1D misses.  |                 |
| CBH        | 80H         | MEM_LOAD_RETIRE.DTLB_MISS              | Counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault. This event counts loads from cacheable memory only. The event does not count loads by software prefetches. Counts both primary and secondary misses to the TLB. |                 |
| CCH        | 01H         | FP_MMX_TRANS.TO_FP                     | Counts the first floating-point instruction following any MMX instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.   |                 |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic        | Description   | Comment |
|------------|-------------|----------------------------|---|---------|
| CCH        | 02H         | FP_MMX_TRANS.TO_MMX        | Counts the first MMX instruction following a floating-point instruction. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.   |         |
| CCH        | 03H         | FP_MMX_TRANS.ANY           | Counts all transitions from floating point to MMX instructions and from MMX instructions to floating point instructions. You can use this event to estimate the penalties for the transitions between floating-point and MMX technology states.   |         |
| D0H        | 01H         | MACRO_INSTS.DECODED        | Counts the number of instructions decoded, (but not necessarily executed or retired).   |         |
| D1H        | 01H         | UOPS_DECODED.STALL_CYCLE_S | Counts the cycles of decoder stalls. INV=1, Cmask=1.  |         |
| D1H        | 02H         | UOPS_DECODED.MS            | Counts the number of Uops decoded by the Microcode Sequencer, MS. The MS delivers uops when the instruction is more than 4 uops long or a microcode assist is occurring.  |         |
| D1H        | 04H         | UOPS_DECODED.ESP_FOLDING   | Counts number of stack pointer (ESP) instructions decoded: push, pop, call, ret, etc. ESP instructions do not generate a Uop to increment or decrement ESP. Instead, they update an ESP_Offset register that keeps track of the delta to the current value of the ESP register.   |         |
| D1H        | 08H         | UOPS_DECODED.ESP_SYNC      | Counts number of stack pointer (ESP) sync operations where an ESP instruction is corrected by adding the ESP offset register to the current value of the ESP register.  |         |
| D2H        | 01H         | RAT_STALLS.FLAGS           | Counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall. A partial register stall may occur when two conditions are met: 1) an instruction modifies some, but not all, of the flags in the flag register and 2) the next instruction, which depends on flags, depends on flags that were not modified by this instruction.                 |         |
| D2H        | 02H         | RAT_STALLS.REGISTERS       | This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction used a register that was partially written by previous instruction.   |         |
| D2H        | 04H         | RAT_STALLS.ROB_READ_PORT   | Counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline. Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read port stall is counted again. |         |
| D2H        | 08H         | RAT_STALLS.SCOREBOARD      | Counts the cycles where we stall due to microarchitecturally required serialization. Microcode scoreboarding stalls.  |         |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic  | Description   | Comment   |
|------------|-------------|----------------------|---|---|
| D2H        | 0FH         | RAT_STALLS.ANY       | Counts all Register Allocation Table stall cycles due to: Cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the execution pipe, Cycles when partial register stalls occurred, Cycles when flag stalls occurred, Cycles floating-point unit (FPU) status word stalls occurred. To count each of these conditions separately use the events: RAT_STALLS.ROB_READ_PORT, RAT_STALLS.PARTIAL, RAT_STALLS.FLAGS, and RAT_STALLS.FPSW.                     |   |
| D4H        | 01H         | SEG_RENAME_STALLS    | Counts the number of stall cycles due to the lack of renaming resources for the ES, DS, FS, and GS segment registers. If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.  |   |
| D5H        | 01H         | ES_REG_RENAMES       | Counts the number of times the ES segment register is renamed.  |   |
| DBH        | 01H         | UOP_UNFUSION         | Counts unfusion events due to floating point exception to a fused uop.  |   |
| E0H        | 01H         | BR_INST_DECODED      | Counts the number of branch instructions decoded.   |   |
| E5H        | 01H         | BPU_MISSED_CALL_RET  | Counts number of times the Branch Prediction Unit missed predicting a call or return branch.  |   |
| E6H        | 01H         | BACLEAR.CLEAR        | Counts the number of times the front end is resteered, mainly when the Branch Prediction Unit cannot provide a correct prediction and this is corrected by the Branch Address Calculator at the front end. This can occur if the code has many branches such that they cannot be consumed by the BPU. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline. The effect on total execution time depends on the surrounding code. |   |
| E6H        | 02H         | BACLEAR.BAD_TARGET   | Counts number of Branch Address Calculator clears (BACLEAR) asserted due to conditional branch instructions in which there was a target hit but the direction was wrong. Each BACLEAR asserted by the BAC generates approximately an 8 cycle bubble in the instruction fetch pipeline.  |   |
| E8H        | 01H         | BPU_CLEARS.EARLY     | Counts early (normal) Branch Prediction Unit clears: BPU predicted a taken branch after incorrectly assuming that it was not taken.   | The BPU clear leads to 2 cycle bubble in the front end. |
| E8H        | 02H         | BPU_CLEARS.LATE      | Counts late Branch Prediction Unit clears due to Most Recently Used conflicts. The BPU clear leads to a 3 cycle bubble in the front end.  |   |
| ECH        | 01H         | THREAD_ACTIVE        | Counts cycles threads are active.   |   |
| F0H        | 01H         | L2_TRANSACTIONS.LOAD | Counts L2 load operations due to HW prefetch or demand loads.   |   |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic         | Description  | Comment |
|------------|-------------|-----------------------------|--|---------|
| F0H        | 02H         | L2_TRANSACTIONS.RFO         | Counts L2 RFO operations due to HW prefetch or demand RFOs.  |         |
| F0H        | 04H         | L2_TRANSACTIONS.IFETCH      | Counts L2 instruction fetch operations due to HW prefetch or demand ifetch.  |         |
| F0H        | 08H         | L2_TRANSACTIONS.PREFETCH    | Counts L2 prefetch operations.   |         |
| F0H        | 10H         | L2_TRANSACTIONS.L1D_WB      | Counts L1D writeback operations to the L2.   |         |
| F0H        | 20H         | L2_TRANSACTIONS.FILL        | Counts L2 cache line fill operations due to load, RFO, L1D writeback or prefetch.  |         |
| F0H        | 40H         | L2_TRANSACTIONS.WB          | Counts L2 writeback operations to the L3.  |         |
| F0H        | 80H         | L2_TRANSACTIONS.ANY         | Counts all L2 cache operations.  |         |
| F1H        | 02H         | L2_LINES_IN.S_STATE         | Counts the number of cache lines allocated in the L2 cache in the S (shared) state.  |         |
| F1H        | 04H         | L2_LINES_IN.E_STATE         | Counts the number of cache lines allocated in the L2 cache in the E (exclusive) state.   |         |
| F1H        | 07H         | L2_LINES_IN.ANY             | Counts the number of cache lines allocated in the L2 cache.  |         |
| F2H        | 01H         | L2_LINES_OUT.DEMAND_CLEAN   | Counts L2 clean cache lines evicted by a demand request.   |         |
| F2H        | 02H         | L2_LINES_OUT.DEMAND_DIRTY   | Counts L2 dirty (modified) cache lines evicted by a demand request.  |         |
| F2H        | 04H         | L2_LINES_OUT.PREFETCH_CLEAN | Counts L2 clean cache line evicted by a prefetch request.  |         |
| F2H        | 08H         | L2_LINES_OUT.PREFETCH_DIRTY | Counts L2 modified cache line evicted by a prefetch request.   |         |
| F2H        | 0FH         | L2_LINES_OUT.ANY            | Counts all L2 cache lines evicted for any reason.  |         |
| F4H        | 04H         | SQ_MISC.LRU_HINTS           | Counts number of Super Queue LRU hints sent to L3.   |         |
| F4H        | 10H         | SQ_MISC.SPLIT_LOCK          | Counts the number of SQ lock splits across a cache line.   |         |
| F6H        | 01H         | SQ_FULL_STALL_CYCLES        | Counts cycles the Super Queue is full. Neither of the threads on this core will be able to access the uncore.  |         |
| F7H        | 01H         | FP_ASSIST.ALL               | Counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases: SSE instructions, (Denormal input when the DAZ flag is off or Underflow result when the FTZ flag is off); x87 instructions, (NaN or denormal are loaded to a register or used as input from memory, Division by 0 or Underflow output). |         |
| F7H        | 02H         | FP_ASSIST.OUTPUT            | Counts number of floating point micro-code assist when the output value (destination register) is invalid.   |         |
| F7H        | 04H         | FP_ASSIST.INPUT             | Counts number of floating point micro-code assist when the input value (one of the source operands to an FP instruction) is invalid.   |         |

**Table 19-21. Performance Events In the Processor Core for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic        | Description  | Comment |
|------------|-------------|----------------------------|--|---------|
| FDH        | 01H         | SIMD_INT_64.PACKED_MPY     | Counts number of SIMD integer 64 bit packed multiply operations. |         |
| FDH        | 02H         | SIMD_INT_64.PACKED_SHIFT   | Counts number of SIMD integer 64 bit packed shift operations.    |         |
| FDH        | 04H         | SIMD_INT_64.PACK           | Counts number of SIMD integer 64 bit pack operations.            |         |
| FDH        | 08H         | SIMD_INT_64.UNPACK         | Counts number of SIMD integer 64 bit unpack operations.          |         |
| FDH        | 10H         | SIMD_INT_64.PACKED_LOGICAL | Counts number of SIMD integer 64 bit logical operations.         |         |
| FDH        | 20H         | SIMD_INT_64.PACKED_ARITH   | Counts number of SIMD integer 64 bit arithmetic operations.      |         |
| FDH        | 40H         | SIMD_INT_64.SHUFFLE_MOVE   | Counts number of SIMD integer 64 bit shift or move operations.   |         |

Model-specific performance monitoring events of the uncore sub-system for processors with CPUID signature of DisplayFamily\_DisplayModel 06\_25H, 06\_2CH, and 06\_1FH support performance events listed in Table 19-22.

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere**

| Event Num. | Umask Value | Event Mask Mnemonic                        | Description  | Comment |
|------------|-------------|--|--|---------|
| 00H        | 01H         | UNC_GQ_CYCLES_FULL.READ_TRACKER            | Uncore cycles Global Queue read tracker is full.   |         |
| 00H        | 02H         | UNC_GQ_CYCLES_FULL.WRITE_TRACKER           | Uncore cycles Global Queue write tracker is full.  |         |
| 00H        | 04H         | UNC_GQ_CYCLES_FULL.PEER_PROBE_TRACKER      | Uncore cycles Global Queue peer probe tracker is full. The peer probe tracker queue tracks snoops from the IOH and remote sockets.   |         |
| 01H        | 01H         | UNC_GQ_CYCLES_NOT_EMPTY.READ_TRACKER       | Uncore cycles were Global Queue read tracker has at least one valid entry.   |         |
| 01H        | 02H         | UNC_GQ_CYCLES_NOT_EMPTY.WRITE_TRACKER      | Uncore cycles were Global Queue write tracker has at least one valid entry.  |         |
| 01H        | 04H         | UNC_GQ_CYCLES_NOT_EMPTY.PEER_PROBE_TRACKER | Uncore cycles were Global Queue peer probe tracker has at least one valid entry. The peer probe tracker queue tracks IOH and remote socket snoops.   |         |
| 02H        | 01H         | UNC_GQ_OCCUPANCY.READ_TRACKER              | Increments the number of queue entries (code read, data read, and RFOs) in the tread tracker. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency. |         |
| 03H        | 01H         | UNC_GQ_ALLOC.READ_TRACKER                  | Counts the number of tread tracker allocate to deallocate entries. The GQ read tracker allocate to deallocate occupancy count is divided by the count to obtain the average read tracker latency.                            |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic               | Description  | Comment |
|------------|-------------|-----------------------------------|--|---------|
| 03H        | 02H         | UNC_GQ_ALLOC.RT_L3_MISS           | Counts the number GQ read tracker entries for which a full cache line read has missed the L3. The GQ read tracker L3 miss to fill occupancy count is divided by this count to obtain the average cache line read L3 miss latency. The latency represents the time after which the L3 has determined that the cache line has missed. The time between a GQ read tracker allocation and the L3 determining that the cache line has missed is the average L3 hit latency. The total L3 cache line read miss latency is the hit latency + L3 miss latency. |         |
| 03H        | 04H         | UNC_GQ_ALLOC.RT_TO_L3_RE SP       | Counts the number of GQ read tracker entries that are allocated in the read tracker queue that hit or miss the L3. The GQ read tracker L3 hit occupancy count is divided by this count to obtain the average L3 hit latency.   |         |
| 03H        | 08H         | UNC_GQ_ALLOC.RT_TO_RTID_ ACQUIRED | Counts the number of GQ read tracker entries that are allocated in the read tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ read tracker L3 miss to RTID acquired occupancy count is divided by this count to obtain the average latency for a read L3 miss to acquire an RTID.  |         |
| 03H        | 10H         | UNC_GQ_ALLOC.WT_TO_RTID_ ACQUIRED | Counts the number of GQ write tracker entries that are allocated in the write tracker, have missed in the L3 and have not acquired a Request Transaction ID. The GQ write tracker L3 miss to RTID occupancy count is divided by this count to obtain the average latency for a write L3 miss to acquire an RTID.   |         |
| 03H        | 20H         | UNC_GQ_ALLOC.WRITE_TRAC KER       | Counts the number of GQ write tracker entries that are allocated in the write tracker queue that miss the L3. The GQ write tracker occupancy count is divided by this count to obtain the average L3 write miss latency.   |         |
| 03H        | 40H         | UNC_GQ_ALLOC.PEER_PROBE _TRACKER  | Counts the number of GQ peer probe tracker (snoop) entries that are allocated in the peer probe tracker queue that miss the L3. The GQ peer probe occupancy count is divided by this count to obtain the average L3 peer probe miss latency.   |         |
| 04H        | 01H         | UNC_GQ_DATA.FROM_QPI              | Cycles Global Queue Quickpath Interface input data port is busy importing data from the Quickpath Interface. Each cycle the input port can transfer 8 or 16 bytes of data.   |         |
| 04H        | 02H         | UNC_GQ_DATA.FROM_QMC              | Cycles Global Queue Quickpath Memory Interface input data port is busy importing data from the Quickpath Memory Interface. Each cycle the input port can transfer 8 or 16 bytes of data.   |         |
| 04H        | 04H         | UNC_GQ_DATA.FROM_L3               | Cycles GQ L3 input data port is busy importing data from the Last Level Cache. Each cycle the input port can transfer 32 bytes of data.  |         |
| 04H        | 08H         | UNC_GQ_DATA.FROM_CORES_ 02        | Cycles GQ Core 0 and 2 input data port is busy importing data from processor cores 0 and 2. Each cycle the input port can transfer 32 bytes of data.   |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                     | Description   | Comment |
|------------|-------------|---|---|---------|
| 04H        | 10H         | UNC_GQ_DATA.FROM_CORES_13               | Cycles GQ Core 1 and 3 input data port is busy importing data from processor cores 1 and 3. Each cycle the input port can transfer 32 bytes of data.  |         |
| 05H        | 01H         | UNC_GQ_DATA.TO_QPI_QMC                  | Cycles GQ QPI and QMC output data port is busy sending data to the Quickpath Interface or Quickpath Memory Interface. Each cycle the output port can transfer 32 bytes of data.   |         |
| 05H        | 02H         | UNC_GQ_DATA.TO_L3                       | Cycles GQ L3 output data port is busy sending data to the Last Level Cache. Each cycle the output port can transfer 32 bytes of data.   |         |
| 05H        | 04H         | UNC_GQ_DATA.TO_CORES                    | Cycles GQ Core output data port is busy sending data to the Cores. Each cycle the output port can transfer 32 bytes of data.  |         |
| 06H        | 01H         | UNC_SNP_RESP_TO_LOCAL_HOME.I_STATE      | Number of snoop responses to the local home that L3 does not have the referenced cache line.  |         |
| 06H        | 02H         | UNC_SNP_RESP_TO_LOCAL_HOME.S_STATE      | Number of snoop responses to the local home that L3 has the referenced line cached in the S state.  |         |
| 06H        | 04H         | UNC_SNP_RESP_TO_LOCAL_HOME.FWD_S_STATE  | Number of responses to code or data read snoops to the local home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the local home in the S state. |         |
| 06H        | 08H         | UNC_SNP_RESP_TO_LOCAL_HOME.FWD_I_STATE  | Number of responses to read invalidate snoops to the local home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the local home in the M state.              |         |
| 06H        | 10H         | UNC_SNP_RESP_TO_LOCAL_HOME.CONFLICT     | Number of conflict snoop responses sent to the local home.  |         |
| 06H        | 20H         | UNC_SNP_RESP_TO_LOCAL_HOME.WB           | Number of responses to code or data read snoops to the local home that the L3 has the referenced line cached in the M state.  |         |
| 07H        | 01H         | UNC_SNP_RESP_TO_REMOTE_HOME.I_STATE     | Number of snoop responses to a remote home that L3 does not have the referenced cache line.   |         |
| 07H        | 02H         | UNC_SNP_RESP_TO_REMOTE_HOME.S_STATE     | Number of snoop responses to a remote home that L3 has the referenced line cached in the S state.   |         |
| 07H        | 04H         | UNC_SNP_RESP_TO_REMOTE_HOME.FWD_S_STATE | Number of responses to code or data read snoops to a remote home that the L3 has the referenced cache line in the E state. The L3 cache line state is changed to the S state and the line is forwarded to the remote home in the S state. |         |
| 07H        | 08H         | UNC_SNP_RESP_TO_REMOTE_HOME.FWD_I_STATE | Number of responses to read invalidate snoops to a remote home that the L3 has the referenced cache line in the M state. The L3 cache line state is invalidated and the line is forwarded to the remote home in the M state.              |         |
| 07H        | 10H         | UNC_SNP_RESP_TO_REMOTE_HOME.CONFLICT    | Number of conflict snoop responses sent to the local home.  |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic              | Description   | Comment |
|------------|-------------|----------------------------------|---|---------|
| 07H        | 20H         | UNC_SNP_RESP_TO_REMOTE_HOME.WB   | Number of responses to code or data read snoops to a remote home that the L3 has the referenced line cached in the M state.   |         |
| 07H        | 24H         | UNC_SNP_RESP_TO_REMOTE_HOME.HITM | Number of HITM snoop responses to a remote home.  |         |
| 08H        | 01H         | UNC_L3_HITS.READ                 | Number of code read, data read and RFO requests that hit in the L3.   |         |
| 08H        | 02H         | UNC_L3_HITS.WRITE                | Number of writeback requests that hit in the L3. Writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.   |         |
| 08H        | 04H         | UNC_L3_HITS.PROBE                | Number of snoops from IOH or remote sockets that hit in the L3.   |         |
| 08H        | 03H         | UNC_L3_HITS.ANY                  | Number of reads and writes that hit the L3.   |         |
| 09H        | 01H         | UNC_L3_MISS.READ                 | Number of code read, data read and RFO requests that miss the L3.   |         |
| 09H        | 02H         | UNC_L3_MISS.WRITE                | Number of writeback requests that miss the L3. Should always be zero as writebacks from the cores will always result in L3 hits due to the inclusive property of the L3.                                      |         |
| 09H        | 04H         | UNC_L3_MISS.PROBE                | Number of snoops from IOH or remote sockets that miss the L3.   |         |
| 09H        | 03H         | UNC_L3_MISS.ANY                  | Number of reads and writes that miss the L3.  |         |
| 0AH        | 01H         | UNC_L3_LINES_IN.M_STATE          | Counts the number of L3 lines allocated in M state. The only time a cache line is allocated in the M state is when the line was forwarded in M state is forwarded due to a Snoop Read Invalidate Own request. |         |
| 0AH        | 02H         | UNC_L3_LINES_IN.E_STATE          | Counts the number of L3 lines allocated in E state.   |         |
| 0AH        | 04H         | UNC_L3_LINES_IN.S_STATE          | Counts the number of L3 lines allocated in S state.   |         |
| 0AH        | 08H         | UNC_L3_LINES_IN.F_STATE          | Counts the number of L3 lines allocated in F state.   |         |
| 0AH        | 0FH         | UNC_L3_LINES_IN.ANY              | Counts the number of L3 lines allocated in any state.   |         |
| 0BH        | 01H         | UNC_L3_LINES_OUT.M_STATE         | Counts the number of L3 lines victimized that were in the M state. When the victim cache line is in M state, the line is written to its home cache agent which can be either local or remote.                 |         |
| 0BH        | 02H         | UNC_L3_LINES_OUT.E_STATE         | Counts the number of L3 lines victimized that were in the E state.  |         |
| 0BH        | 04H         | UNC_L3_LINES_OUT.S_STATE         | Counts the number of L3 lines victimized that were in the S state.  |         |
| 0BH        | 08H         | UNC_L3_LINES_OUT.I_STATE         | Counts the number of L3 lines victimized that were in the I state.  |         |
| 0BH        | 10H         | UNC_L3_LINES_OUT.F_STATE         | Counts the number of L3 lines victimized that were in the F state.  |         |
| 0BH        | 1FH         | UNC_L3_LINES_OUT.ANY             | Counts the number of L3 lines victimized in any state.  |         |
| 0CH        | 01H         | UNC_GQ_SNOOP.GOTO_S              | Counts the number of remote snoops that have requested a cache line be set to the S state.  |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description   | Comment                                   |
|------------|-------------|--------------------------------|---|---|
| 0CH        | 02H         | UNC_GQ_SNOOP.GOTO_I            | Counts the number of remote snoops that have requested a cache line be set to the I state.                        |   |
| 0CH        | 04H         | UNC_GQ_SNOOP.GOTO_S_HIT_E      | Counts the number of remote snoops that have requested a cache line be set to the S state from E state.           | Requires writing MSR 301H with mask = 2H. |
| 0CH        | 04H         | UNC_GQ_SNOOP.GOTO_S_HIT_F      | Counts the number of remote snoops that have requested a cache line be set to the S state from F (forward) state. | Requires writing MSR 301H with mask = 8H. |
| 0CH        | 04H         | UNC_GQ_SNOOP.GOTO_S_HIT_M      | Counts the number of remote snoops that have requested a cache line be set to the S state from M state.           | Requires writing MSR 301H with mask = 1H. |
| 0CH        | 04H         | UNC_GQ_SNOOP.GOTO_S_HIT_S      | Counts the number of remote snoops that have requested a cache line be set to the S state from S state.           | Requires writing MSR 301H with mask = 4H. |
| 0CH        | 08H         | UNC_GQ_SNOOP.GOTO_I_HIT_E      | Counts the number of remote snoops that have requested a cache line be set to the I state from E state.           | Requires writing MSR 301H with mask = 2H. |
| 0CH        | 08H         | UNC_GQ_SNOOP.GOTO_I_HIT_F      | Counts the number of remote snoops that have requested a cache line be set to the I state from F (forward) state. | Requires writing MSR 301H with mask = 8H. |
| 0CH        | 08H         | UNC_GQ_SNOOP.GOTO_I_HIT_M      | Counts the number of remote snoops that have requested a cache line be set to the I state from M state.           | Requires writing MSR 301H with mask = 1H. |
| 0CH        | 08H         | UNC_GQ_SNOOP.GOTO_I_HIT_S      | Counts the number of remote snoops that have requested a cache line be set to the I state from S state.           | Requires writing MSR 301H with mask = 4H. |
| 20H        | 01H         | UNC_QHL_REQUESTS.IOH_READS     | Counts number of Quickpath Home Logic read requests from the IOH.   |   |
| 20H        | 02H         | UNC_QHL_REQUESTS.IOH_WRITES    | Counts number of Quickpath Home Logic write requests from the IOH.  |   |
| 20H        | 04H         | UNC_QHL_REQUESTS.REMOTE_READS  | Counts number of Quickpath Home Logic read requests from a remote socket.   |   |
| 20H        | 08H         | UNC_QHL_REQUESTS.REMOTE_WRITES | Counts number of Quickpath Home Logic write requests from a remote socket.  |   |
| 20H        | 10H         | UNC_QHL_REQUESTS.LOCAL_READS   | Counts number of Quickpath Home Logic read requests from the local socket.  |   |
| 20H        | 20H         | UNC_QHL_REQUESTS.LOCAL_WRITES  | Counts number of Quickpath Home Logic write requests from the local socket.                                       |   |
| 21H        | 01H         | UNC_QHL_CYCLES_FULL.IOH        | Counts uclk cycles all entries in the Quickpath Home Logic IOH are full.  |   |
| 21H        | 02H         | UNC_QHL_CYCLES_FULL.REMOTE     | Counts uclk cycles all entries in the Quickpath Home Logic remote tracker are full.                               |   |
| 21H        | 04H         | UNC_QHL_CYCLES_FULL.LOCAL      | Counts uclk cycles all entries in the Quickpath Home Logic local tracker are full.                                |   |
| 22H        | 01H         | UNC_QHL_CYCLES_NOT_EMPTY.IOH   | Counts uclk cycles all entries in the Quickpath Home Logic IOH is busy.   |   |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic             | Description  | Comment |
|------------|-------------|---------------------------------|--|---------|
| 22H        | 02H         | UNC_QHL_CYCLES_NOT_EMPTY.REMOTE | Counts uclk cycles all entries in the Quickpath Home Logic remote tracker is busy.   |         |
| 22H        | 04H         | UNC_QHL_CYCLES_NOT_EMPTY.LOCAL  | Counts uclk cycles all entries in the Quickpath Home Logic local tracker is busy.  |         |
| 23H        | 01H         | UNC_QHL_OCCUPANCY.IOH           | QHL IOH tracker allocate to deallocate read occupancy.   |         |
| 23H        | 02H         | UNC_QHL_OCCUPANCY.REMOTE        | QHL remote tracker allocate to deallocate read occupancy.  |         |
| 23H        | 04H         | UNC_QHL_OCCUPANCY.LOCAL         | QHL local tracker allocate to deallocate read occupancy.   |         |
| 24H        | 02H         | UNC_QHL_ADDRESS_CONFLICTS.2WAY  | Counts number of QHL Active Address Table (AAT) entries that saw a max of 2 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates. |         |
| 24H        | 04H         | UNC_QHL_ADDRESS_CONFLICTS.3WAY  | Counts number of QHL Active Address Table (AAT) entries that saw a max of 3 conflicts. The AAT is a structure that tracks requests that are in conflict. The requests themselves are in the home tracker entries. The count is reported when an AAT entry deallocates. |         |
| 25H        | 01H         | UNC_QHL_CONFLICT_CYCLES.IOH     | Counts cycles the Quickpath Home Logic IOH Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.   |         |
| 25H        | 02H         | UNC_QHL_CONFLICT_CYCLES.REMOTE  | Counts cycles the Quickpath Home Logic Remote Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.  |         |
| 25H        | 04H         | UNC_QHL_CONFLICT_CYCLES.LOCAL   | Counts cycles the Quickpath Home Logic Local Tracker contains two or more requests with an address conflict. A max of 3 requests can be in conflict.   |         |
| 26H        | 01H         | UNC_QHL_TO_QMC_BYPASS           | Counts number or requests to the Quickpath Memory Controller that bypass the Quickpath Home Logic. All local accesses can be bypassed. For remote requests, only read requests can be bypassed.  |         |
| 28H        | 01H         | UNC_QMC_ISOC_FULL.READ.CH0      | Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous read requests.   |         |
| 28H        | 02H         | UNC_QMC_ISOC_FULL.READ.CH1      | Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous read requests.   |         |
| 28H        | 04H         | UNC_QMC_ISOC_FULL.READ.CH2      | Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous read requests.   |         |
| 28H        | 08H         | UNC_QMC_ISOC_FULL.WRITE.CH0     | Counts cycles all the entries in the DRAM channel 0 high priority queue are occupied with isochronous write requests.  |         |
| 28H        | 10H         | UNC_QMC_ISOC_FULL.WRITE.CH1     | Counts cycles all the entries in the DRAM channel 1 high priority queue are occupied with isochronous write requests.  |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic         | Description  | Comment |
|------------|-------------|-----------------------------|--|---------|
| 28H        | 20H         | UNC_QMC_ISOC_FULL.WRITE.CH2 | Counts cycles all the entries in the DRAM channel 2 high priority queue are occupied with isochronous write requests.  |         |
| 29H        | 01H         | UNC_QMC_BUSY.READ.CH0       | Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 0.   |         |
| 29H        | 02H         | UNC_QMC_BUSY.READ.CH1       | Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 1.   |         |
| 29H        | 04H         | UNC_QMC_BUSY.READ.CH2       | Counts cycles where Quickpath Memory Controller has at least 1 outstanding read request to DRAM channel 2.   |         |
| 29H        | 08H         | UNC_QMC_BUSY.WRITE.CH0      | Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 0.  |         |
| 29H        | 10H         | UNC_QMC_BUSY.WRITE.CH1      | Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 1.  |         |
| 29H        | 20H         | UNC_QMC_BUSY.WRITE.CH2      | Counts cycles where Quickpath Memory Controller has at least 1 outstanding write request to DRAM channel 2.  |         |
| 2AH        | 01H         | UNC_QMC_OCCUPANCY.CH0       | IMC channel 0 normal read request occupancy.   |         |
| 2AH        | 02H         | UNC_QMC_OCCUPANCY.CH1       | IMC channel 1 normal read request occupancy.   |         |
| 2AH        | 04H         | UNC_QMC_OCCUPANCY.CH2       | IMC channel 2 normal read request occupancy.   |         |
| 2AH        | 07H         | UNC_QMC_OCCUPANCY.ANY       | Normal read request occupancy for any channel.   |         |
| 2BH        | 01H         | UNC_QMC_ISSOC_OCCUPANCY.CH0 | IMC channel 0 issoc read request occupancy.  |         |
| 2BH        | 02H         | UNC_QMC_ISSOC_OCCUPANCY.CH1 | IMC channel 1 issoc read request occupancy.  |         |
| 2BH        | 04H         | UNC_QMC_ISSOC_OCCUPANCY.CH2 | IMC channel 2 issoc read request occupancy.  |         |
| 2BH        | 07H         | UNC_QMC_ISSOC_READS.ANY     | IMC issoc read request occupancy.  |         |
| 2CH        | 01H         | UNC_QMC_NORMAL_READS.CH0    | Counts the number of Quickpath Memory Controller channel 0 medium and low priority read requests. The QMC channel 0 normal read occupancy divided by this count provides the average QMC channel 0 read latency. |         |
| 2CH        | 02H         | UNC_QMC_NORMAL_READS.CH1    | Counts the number of Quickpath Memory Controller channel 1 medium and low priority read requests. The QMC channel 1 normal read occupancy divided by this count provides the average QMC channel 1 read latency. |         |
| 2CH        | 04H         | UNC_QMC_NORMAL_READS.CH2    | Counts the number of Quickpath Memory Controller channel 2 medium and low priority read requests. The QMC channel 2 normal read occupancy divided by this count provides the average QMC channel 2 read latency. |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                 | Description   | Comment |
|------------|-------------|-------------------------------------|---|---------|
| 2CH        | 07H         | UNC_QMC_NORMAL_READS.ANY            | Counts the number of Quickpath Memory Controller medium and low priority read requests. The QMC normal read occupancy divided by this count provides the average QMC read latency.  |         |
| 2DH        | 01H         | UNC_QMC_HIGH_PRIORITY_READS.CH0     | Counts the number of Quickpath Memory Controller channel 0 high priority isochronous read requests.   |         |
| 2DH        | 02H         | UNC_QMC_HIGH_PRIORITY_READS.CH1     | Counts the number of Quickpath Memory Controller channel 1 high priority isochronous read requests.   |         |
| 2DH        | 04H         | UNC_QMC_HIGH_PRIORITY_READS.CH2     | Counts the number of Quickpath Memory Controller channel 2 high priority isochronous read requests.   |         |
| 2DH        | 07H         | UNC_QMC_HIGH_PRIORITY_READS.ANY     | Counts the number of Quickpath Memory Controller high priority isochronous read requests.   |         |
| 2EH        | 01H         | UNC_QMC_CRITICAL_PRIORITY_READS.CH0 | Counts the number of Quickpath Memory Controller channel 0 critical priority isochronous read requests.   |         |
| 2EH        | 02H         | UNC_QMC_CRITICAL_PRIORITY_READS.CH1 | Counts the number of Quickpath Memory Controller channel 1 critical priority isochronous read requests.   |         |
| 2EH        | 04H         | UNC_QMC_CRITICAL_PRIORITY_READS.CH2 | Counts the number of Quickpath Memory Controller channel 2 critical priority isochronous read requests.   |         |
| 2EH        | 07H         | UNC_QMC_CRITICAL_PRIORITY_READS.ANY | Counts the number of Quickpath Memory Controller critical priority isochronous read requests.   |         |
| 2FH        | 01H         | UNC_QMC_WRITES.FULL.CH0             | Counts number of full cache line writes to DRAM channel 0.  |         |
| 2FH        | 02H         | UNC_QMC_WRITES.FULL.CH1             | Counts number of full cache line writes to DRAM channel 1.  |         |
| 2FH        | 04H         | UNC_QMC_WRITES.FULL.CH2             | Counts number of full cache line writes to DRAM channel 2.  |         |
| 2FH        | 07H         | UNC_QMC_WRITES.FULL.ANY             | Counts number of full cache line writes to DRAM.  |         |
| 2FH        | 08H         | UNC_QMC_WRITES.PARTIAL.CH0          | Counts number of partial cache line writes to DRAM channel 0.   |         |
| 2FH        | 10H         | UNC_QMC_WRITES.PARTIAL.CH1          | Counts number of partial cache line writes to DRAM channel 1.   |         |
| 2FH        | 20H         | UNC_QMC_WRITES.PARTIAL.CH2          | Counts number of partial cache line writes to DRAM channel 2.   |         |
| 2FH        | 38H         | UNC_QMC_WRITES.PARTIAL.ANY          | Counts number of partial cache line writes to DRAM.   |         |
| 30H        | 01H         | UNC_QMC_CANCEL.CH0                  | Counts number of DRAM channel 0 cancel requests.  |         |
| 30H        | 02H         | UNC_QMC_CANCEL.CH1                  | Counts number of DRAM channel 1 cancel requests.  |         |
| 30H        | 04H         | UNC_QMC_CANCEL.CH2                  | Counts number of DRAM channel 2 cancel requests.  |         |
| 30H        | 07H         | UNC_QMC_CANCEL.ANY                  | Counts number of DRAM cancel requests.  |         |
| 31H        | 01H         | UNC_QMC_PRIORITY_UPDATE.S.CH0       | Counts number of DRAM channel 0 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request. |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic           | Description   | Comment |
|------------|-------------|-------------------------------|---|---------|
| 31H        | 02H         | UNC_QMC_PRIORITY_UPDATE.S.CH1 | Counts number of DRAM channel 1 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request. |         |
| 31H        | 04H         | UNC_QMC_PRIORITY_UPDATE.S.CH2 | Counts number of DRAM channel 2 priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request. |         |
| 31H        | 07H         | UNC_QMC_PRIORITY_UPDATE.S.ANY | Counts number of DRAM priority updates. A priority update occurs when an ISOC high or critical request is received by the QHL and there is a matching request with normal priority that has already been issued to the QMC. In this instance, the QHL will send a priority update to QMC to expedite the request.           |         |
| 32H        | 01H         | UNC_IMC_RETRY.CH0             | Counts number of IMC DRAM channel 0 retries. DRAM retry only occurs when configured in RAS mode.  |         |
| 32H        | 02H         | UNC_IMC_RETRY.CH1             | Counts number of IMC DRAM channel 1 retries. DRAM retry only occurs when configured in RAS mode.  |         |
| 32H        | 04H         | UNC_IMC_RETRY.CH2             | Counts number of IMC DRAM channel 2 retries. DRAM retry only occurs when configured in RAS mode.  |         |
| 32H        | 07H         | UNC_IMC_RETRY.ANY             | Counts number of IMC DRAM retries from any channel. DRAM retry only occurs when configured in RAS mode.   |         |
| 33H        | 01H         | UNC_QHL_FRC_ACK_CNFLTS.IOH    | Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the IOH.   |         |
| 33H        | 02H         | UNC_QHL_FRC_ACK_CNFLTS.REMOTE | Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the remote home.   |         |
| 33H        | 04H         | UNC_QHL_FRC_ACK_CNFLTS.LOCAL  | Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic to the local home.  |         |
| 33H        | 07H         | UNC_QHL_FRC_ACK_CNFLTS.ANY    | Counts number of Force Acknowledge Conflict messages sent by the Quickpath Home Logic.  |         |
| 34H        | 01H         | UNC_QHL_SLEEPS.IOH_ORDER      | Counts number of occurrences a request was put to sleep due to IOH ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.   |         |
| 34H        | 02H         | UNC_QHL_SLEEPS.REMOTE_ORDER   | Counts number of occurrences a request was put to sleep due to remote socket ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.   |         |
| 34H        | 04H         | UNC_QHL_SLEEPS.LOCAL_ORDER    | Counts number of occurrences a request was put to sleep due to local socket ordering (write after read) conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.  |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                         | Description  | Comment  |
|------------|-------------|---|--|--|
| 34H        | 08H         | UNC_QHL_SLEEPS.IOH_CONFLICT                 | Counts number of occurrences a request was put to sleep due to IOH address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.  |  |
| 34H        | 10H         | UNC_QHL_SLEEPS.REMOTE_CONFLICT              | Counts number of occurrences a request was put to sleep due to remote socket address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.  |  |
| 34H        | 20H         | UNC_QHL_SLEEPS.LOCAL_CONFLICT               | Counts number of occurrences a request was put to sleep due to local socket address conflicts. While in the sleep state, the request is not eligible to be scheduled to the QMC.   |  |
| 35H        | 01H         | UNC_ADDR_OPCODE_MATCH.IOH                   | Counts number of requests from the IOH, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported:<br>0: NONE<br>40000000_00000000H:RSPFWDI<br>40001A00_00000000H:RSPFWDs<br>40001D00_00000000H:RSPIWB             | Match opcode/address by writing MSR 396H with mask supported mask value. |
| 35H        | 02H         | UNC_ADDR_OPCODE_MATCH.REMOTE                | Counts number of requests from the remote socket, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported:<br>0: NONE<br>40000000_00000000H:RSPFWDI<br>40001A00_00000000H:RSPFWDs<br>40001D00_00000000H:RSPIWB   | Match opcode/address by writing MSR 396H with mask supported mask value. |
| 35H        | 04H         | UNC_ADDR_OPCODE_MATCH.LOCAL                 | Counts number of requests from the local socket, address/opcode of request is qualified by mask value written to MSR 396H. The following mask values are supported:<br>0: NONE<br>40000000_00000000H:RSPFWDI<br>40001A00_00000000H:RSPFWDs<br>40001D00_00000000H:RSPIWB    | Match opcode/address by writing MSR 396H with mask supported mask value. |
| 40H        | 01H         | UNC_QPI_TX_STALLED_SINGLE_FLIT.HOME.LINK_0  | Counts cycles the Quickpath outbound link 0 HOME virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.  |  |
| 40H        | 02H         | UNC_QPI_TX_STALLED_SINGLE_FLIT.SNOOP.LINK_0 | Counts cycles the Quickpath outbound link 0 SNOOP virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated. |  |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                             | Description   | Comment |
|------------|-------------|---|---|---------|
| 40H        | 04H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.NDR.LINK_0   | Counts cycles the Quickpath outbound link 0 non-data response virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.    |         |
| 40H        | 08H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.HOME.LINK_1  | Counts cycles the Quickpath outbound link 1 HOME virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                 |         |
| 40H        | 10H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.SNOOP.LINK_1 | Counts cycles the Quickpath outbound link 1 SNOOP virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                |         |
| 40H        | 20H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.NDR.LINK_1   | Counts cycles the Quickpath outbound link 1 non-data response virtual channel is stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.    |         |
| 40H        | 07H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.LINK_0       | Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                    |         |
| 40H        | 38H         | UNC_QPI_TX_STALLED_SINGL<br>E_FLIT.LINK_1       | Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of a VNA and VNO credit. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                    |         |
| 41H        | 01H         | UNC_QPI_TX_STALLED_MULTI<br>_FLIT.DRS.LINK_0    | Counts cycles the Quickpath outbound link 0 Data Response virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.         |         |
| 41H        | 02H         | UNC_QPI_TX_STALLED_MULTI<br>_FLIT.NCB.LINK_0    | Counts cycles the Quickpath outbound link 0 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.   |         |
| 41H        | 04H         | UNC_QPI_TX_STALLED_MULTI<br>_FLIT.NCS.LINK_0    | Counts cycles the Quickpath outbound link 0 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated. |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                      | Description   | Comment |
|------------|-------------|--|---|---------|
| 41H        | 08H         | UNC_QPI_TX_STALLED_MULTI_FLIT.DRS.LINK_1 | Counts cycles the Quickpath outbound link 1 Data Response virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.         |         |
| 41H        | 10H         | UNC_QPI_TX_STALLED_MULTI_FLIT.NCB.LINK_1 | Counts cycles the Quickpath outbound link 1 Non-Coherent Bypass virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.   |         |
| 41H        | 20H         | UNC_QPI_TX_STALLED_MULTI_FLIT.NCS.LINK_1 | Counts cycles the Quickpath outbound link 1 Non-Coherent Standard virtual channel is stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated. |         |
| 41H        | 07H         | UNC_QPI_TX_STALLED_MULTI_FLIT.LINK_0     | Counts cycles the Quickpath outbound link 0 virtual channels are stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                     |         |
| 41H        | 38H         | UNC_QPI_TX_STALLED_MULTI_FLIT.LINK_1     | Counts cycles the Quickpath outbound link 1 virtual channels are stalled due to lack of VNA and VNO credits. Note that this event does not filter out when a flit would not have been selected for arbitration because another virtual channel is getting arbitrated.                     |         |
| 42H        | 01H         | UNC_QPI_TX_HEADER.FULL.LINK_0            | Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is full.   |         |
| 42H        | 02H         | UNC_QPI_TX_HEADER.BUSY.LINK_0            | Number of cycles that the header buffer in the Quickpath Interface outbound link 0 is busy.   |         |
| 42H        | 04H         | UNC_QPI_TX_HEADER.FULL.LINK_1            | Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is full.   |         |
| 42H        | 08H         | UNC_QPI_TX_HEADER.BUSY.LINK_1            | Number of cycles that the header buffer in the Quickpath Interface outbound link 1 is busy.   |         |
| 43H        | 01H         | UNC_QPI_RX_NO_PPT_CREDIT.STALLS.LINK_0   | Number of cycles that snoop packets incoming to the Quickpath Interface link 0 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.  |         |
| 43H        | 02H         | UNC_QPI_RX_NO_PPT_CREDIT.STALLS.LINK_1   | Number of cycles that snoop packets incoming to the Quickpath Interface link 1 are stalled and not sent to the GQ because the GQ Peer Probe Tracker (PPT) does not have any available entries.  |         |
| 60H        | 01H         | UNC_DRAM_OPEN.CH0                        | Counts number of DRAM Channel 0 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.  |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic            | Description   | Comment |
|------------|-------------|--------------------------------|---|---------|
| 60H        | 02H         | UNC_DRAM_OPEN.CH1              | Counts number of DRAM Channel 1 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.  |         |
| 60H        | 04H         | UNC_DRAM_OPEN.CH2              | Counts number of DRAM Channel 2 open commands issued either for read or write. To read or write data, the referenced DRAM page must first be opened.  |         |
| 61H        | 01H         | UNC_DRAM_PAGE_CLOSE.CH0        | DRAM channel 0 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.   |         |
| 61H        | 02H         | UNC_DRAM_PAGE_CLOSE.CH1        | DRAM channel 1 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.   |         |
| 61H        | 04H         | UNC_DRAM_PAGE_CLOSE.CH2        | DRAM channel 2 command issued to CLOSE a page due to page idle timer expiration. Closing a page is done by issuing a precharge.   |         |
| 62H        | 01H         | UNC_DRAM_PAGE_MISS.CH0         | Counts the number of precharges (PRE) that were issued to DRAM channel 0 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge. |         |
| 62H        | 02H         | UNC_DRAM_PAGE_MISS.CH1         | Counts the number of precharges (PRE) that were issued to DRAM channel 1 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge. |         |
| 62H        | 04H         | UNC_DRAM_PAGE_MISS.CH2         | Counts the number of precharges (PRE) that were issued to DRAM channel 2 because there was a page miss. A page miss refers to a situation in which a page is currently open and another page from the same bank needs to be opened. The new page experiences a page miss. Closing of the old page is done by issuing a precharge. |         |
| 63H        | 01H         | UNC_DRAM_READ_CAS.CH0          | Counts the number of times a read CAS command was issued on DRAM channel 0.   |         |
| 63H        | 02H         | UNC_DRAM_READ_CAS.AUTO PRE_CH0 | Counts the number of times a read CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 63H        | 04H         | UNC_DRAM_READ_CAS.CH1          | Counts the number of times a read CAS command was issued on DRAM channel 1.   |         |
| 63H        | 08H         | UNC_DRAM_READ_CAS.AUTO PRE_CH1 | Counts the number of times a read CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 63H        | 10H         | UNC_DRAM_READ_CAS.CH2          | Counts the number of times a read CAS command was issued on DRAM channel 2.   |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                | Description  | Comment |
|------------|-------------|------------------------------------|--|---------|
| 63H        | 20H         | UNC_DRAM_READ_CAS.AUTO PRE_CH2     | Counts the number of times a read CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.  |         |
| 64H        | 01H         | UNC_DRAM_WRITE_CAS.CH0             | Counts the number of times a write CAS command was issued on DRAM channel 0.   |         |
| 64H        | 02H         | UNC_DRAM_WRITE_CAS.AUTO PRE_CH0    | Counts the number of times a write CAS command was issued on DRAM channel 0 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 64H        | 04H         | UNC_DRAM_WRITE_CAS.CH1             | Counts the number of times a write CAS command was issued on DRAM channel 1.   |         |
| 64H        | 08H         | UNC_DRAM_WRITE_CAS.AUTO PRE_CH1    | Counts the number of times a write CAS command was issued on DRAM channel 1 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 64H        | 10H         | UNC_DRAM_WRITE_CAS.CH2             | Counts the number of times a write CAS command was issued on DRAM channel 2.   |         |
| 64H        | 20H         | UNC_DRAM_WRITE_CAS.AUTO PRE_CH2    | Counts the number of times a write CAS command was issued on DRAM channel 2 where the command issued used the auto-precharge (auto page close) mode.   |         |
| 65H        | 01H         | UNC_DRAM_REFRESH.CH0               | Counts number of DRAM channel 0 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.                   |         |
| 65H        | 02H         | UNC_DRAM_REFRESH.CH1               | Counts number of DRAM channel 1 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.                   |         |
| 65H        | 04H         | UNC_DRAM_REFRESH.CH2               | Counts number of DRAM channel 2 refresh commands. DRAM loses data content over time. In order to keep correct data content, the data values have to be refreshed periodically.                   |         |
| 66H        | 01H         | UNC_DRAM_PRE_ALL.CH0               | Counts number of DRAM Channel 0 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode. |         |
| 66H        | 02H         | UNC_DRAM_PRE_ALL.CH1               | Counts number of DRAM Channel 1 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode. |         |
| 66H        | 04H         | UNC_DRAM_PRE_ALL.CH2               | Counts number of DRAM Channel 2 precharge-all (PREALL) commands that close all open pages in a rank. PREALL is issued when the DRAM needs to be refreshed or needs to go into a power down mode. |         |
| 67H        | 01H         | UNC_DRAM_THERMAL_THROT TLED        | Uncore cycles DRAM was throttled due to its temperature being above the thermal throttling threshold.  |         |
| 80H        | 01H         | UNC_THERMAL_THROTTLING_TEMP.CORE_0 | Cycles that the PCU records that core 0 is above the thermal throttling threshold temperature.   |         |

**Table 19-22. Performance Events In the Processor Uncore for Processors Based on Intel® Microarchitecture Code Name Westmere (Contd.)**

| Event Num. | Umask Value | Event Mask Mnemonic                   | Description   | Comment |
|------------|-------------|---------------------------------------|---|---------|
| 80H        | 02H         | UNC_THERMAL_THROTTLING_TEMP.CORE_1    | Cycles that the PCU records that core 1 is above the thermal throttling threshold temperature.  |         |
| 80H        | 04H         | UNC_THERMAL_THROTTLING_TEMP.CORE_2    | Cycles that the PCU records that core 2 is above the thermal throttling threshold temperature.  |         |
| 80H        | 08H         | UNC_THERMAL_THROTTLING_TEMP.CORE_3    | Cycles that the PCU records that core 3 is above the thermal throttling threshold temperature.  |         |
| 81H        | 01H         | UNC_THERMAL_THROTTLED_TEMP.CORE_0     | Cycles that the PCU records that core 0 is in the power throttled state due to core's temperature being above the thermal throttling threshold.       |         |
| 81H        | 02H         | UNC_THERMAL_THROTTLED_TEMP.CORE_1     | Cycles that the PCU records that core 1 is in the power throttled state due to core's temperature being above the thermal throttling threshold.       |         |
| 81H        | 04H         | UNC_THERMAL_THROTTLED_TEMP.CORE_2     | Cycles that the PCU records that core 2 is in the power throttled state due to core's temperature being above the thermal throttling threshold.       |         |
| 81H        | 08H         | UNC_THERMAL_THROTTLED_TEMP.CORE_3     | Cycles that the PCU records that core 3 is in the power throttled state due to core's temperature being above the thermal throttling threshold.       |         |
| 82H        | 01H         | UNC_PROCHOT_ASSERTION                 | Number of system assertions of PROCHOT indicating the entire processor has exceeded the thermal limit.  |         |
| 83H        | 01H         | UNC_THERMAL_THROTTLING_PROCHOT.CORE_0 | Cycles that the PCU records that core 0 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit. |         |
| 83H        | 02H         | UNC_THERMAL_THROTTLING_PROCHOT.CORE_1 | Cycles that the PCU records that core 1 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit. |         |
| 83H        | 04H         | UNC_THERMAL_THROTTLING_PROCHOT.CORE_2 | Cycles that the PCU records that core 2 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit. |         |
| 83H        | 08H         | UNC_THERMAL_THROTTLING_PROCHOT.CORE_3 | Cycles that the PCU records that core 3 is a low power state due to the system asserting PROCHOT the entire processor has exceeded the thermal limit. |         |
| 84H        | 01H         | UNC_TURBO_MODE.CORE_0                 | Uncore cycles that core 0 is operating in turbo mode.   |         |
| 84H        | 02H         | UNC_TURBO_MODE.CORE_1                 | Uncore cycles that core 1 is operating in turbo mode.   |         |
| 84H        | 04H         | UNC_TURBO_MODE.CORE_2                 | Uncore cycles that core 2 is operating in turbo mode.   |         |
| 84H        | 08H         | UNC_TURBO_MODE.CORE_3                 | Uncore cycles that core 3 is operating in turbo mode.   |         |
| 85H        | 02H         | UNC_CYCLES_UNHALTED_L3_FLL_ENABLE     | Uncore cycles that at least one core is unhalted and all L3 ways are enabled.   |         |
| 86H        | 01H         | UNC_CYCLES_UNHALTED_L3_FLL_DISABLE    | Uncore cycles that at least one core is unhalted and all L3 ways are disabled.  |         |

## 19.11 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON® PROCESSOR 5200, 5400 SERIES AND INTEL® CORE™ 2 EXTREME PROCESSORS QX 9000 SERIES

Processors based on the Enhanced Intel Core microarchitecture support the architectural and model-specific performance monitoring events listed in Table 19-1 and Table 19-25. In addition, they also support the following model-specific performance monitoring events listed in Table 19-23. Fixed counters support the architecture events defined in Table 19-24.

**Table 19-23. Performance Events for Processors Based on Enhanced Intel Core Microarchitecture**

| Event Num. | Umask Value | Event Mask Mnemonic                       | Description  | Comment |
|------------|-------------|---|--|---------|
| COH        | 08H         | INST_RETIRED.VM_HOST                      | Instruction retired while in VMX root operations.  |         |
| D2H        | 10H         | RAT_STAALS.OTHER_SERIALI<br>ZATION_STALLS | This event counts the number of stalls due to other RAT resource serialization not counted by Umask value 0FH. |         |

## 19.12 PERFORMANCE MONITORING EVENTS FOR INTEL® XEON® PROCESSOR 3000, 3200, 5100, 5300 SERIES AND INTEL® CORE™ 2 DUO PROCESSORS

Processors based on the Intel® Core™ microarchitecture support architectural and model-specific performance monitoring events.

Fixed-function performance counters are introduced first on processors based on Intel Core microarchitecture. Table 19-24 lists pre-defined performance events that can be counted using fixed-function performance counters.

**Table 19-24. Fixed-Function Performance Counter and Pre-defined Performance Events**

| Fixed-Function Performance Counter       | Address | Event Mask Mnemonic   | Description   |
|--|---------|-----------------------|---|
| MSR_PERF_FIXED_CTR0/IA32_PERF_FIXED_CTR0 | 309H    | Inst_Retired.Any      | This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.   |
| MSR_PERF_FIXED_CTR1/IA32_PERF_FIXED_CTR1 | 30AH    | CPU_CLK_UNHALTED.CORE | This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios.<br><br>The core frequency may change from time to time due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason this event may have a changing ratio with regards to time. When the core frequency is constant, this event can approximate elapsed time while the core was not in halt state. |
| MSR_PERF_FIXED_CTR2/IA32_PERF_FIXED_CTR2 | 30BH    | CPU_CLK_UNHALTED.REF  | This event counts the number of reference cycles when the core is not in a halt state and not in a TM stop-clock state. The core enters the halt state when it is running the HLT instruction or the MWAIT instruction.   |

**Table 19-24. Fixed-Function Performance Counter and Pre-defined Performance Events (Contd.)**

| Fixed-Function Performance Counter | Address | Event Mask Mnemonic | Description   |
|------------------------------------|---------|---------------------|---|
|                                    |         |                     | <p>This event is not affected by core frequency changes (e.g., P states) but counts at the same frequency as the time stamp counter. This event can approximate elapsed time while the core was not in halt state and not in a TM stop-clock state.</p> <p>This event has a constant ratio with the CPU_CLK_UNHALTED.BUS event.</p> |

Table 19-25 lists general-purpose model-specific performance monitoring events supported in processors based on Intel® Core™ microarchitecture. For convenience, Table 19-25 also includes architectural events and describes minor model-specific behavior where applicable. Software must use a general-purpose performance counter to count events listed in Table 19-25.

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture**

| Event Num | Umask Value | Event Name               | Definition   | Description and Comment   |
|-----------|-------------|--------------------------|--|---|
| 03H       | 02H         | LOAD_BLOCK.STA           | Loads blocked by a preceding store with unknown address.                                 | <p>This event indicates that loads are blocked by preceding stores. A load is blocked when there is a preceding store to an address that is not yet calculated. The number of events is greater or equal to the number of load operations that were blocked.</p> <p>If the load and the store are always to different addresses, check why the memory disambiguation mechanism is not working. To avoid such blocks, increase the distance between the store and the following load so that the store address is known at the time the load is dispatched.</p>  |
| 03H       | 04H         | LOAD_BLOCK.STD           | Loads blocked by a preceding store with unknown data.                                    | <p>This event indicates that loads are blocked by preceding stores. A load is blocked when there is a preceding store to the same address and the stored data value is not yet known. The number of events is greater or equal to the number of load operations that were blocked.</p> <p>To avoid such blocks, increase the distance between the store and the dependent load, so that the store data is known at the time the load is dispatched.</p>   |
| 03H       | 08H         | LOAD_BLOCK.OVERLAP_STORE | Loads that partially overlap an earlier store, or 4-Kbyte aliased with a previous store. | <p>This event indicates that loads are blocked due to a variety of reasons. Some of the triggers for this event are when a load is blocked by a preceding store, in one of the following:</p> <ul style="list-style-type: none"> <li>Some of the loaded byte locations are written by the preceding store and some are not.</li> <li>The load is from bytes written by the preceding store, the store is aligned to its size and either: <ul style="list-style-type: none"> <li>The load's data size is one or two bytes and it is not aligned to the store.</li> <li>The load's data size is of four or eight bytes and the load is misaligned.</li> </ul> </li> </ul> |

Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)

| Event Num | Umask Value | Event Name              | Definition   | Description and Comment  |
|-----------|-------------|-------------------------|--|--|
|           |             |                         |  | <ul style="list-style-type: none"> <li>The load is from bytes written by the preceding store, the store is misaligned and the load is not aligned on the beginning of the store.</li> <li>The load is split over an eight byte boundary (excluding 16-byte loads).</li> <li>The load and store have the same offset relative to the beginning of different 4-KByte pages. This case is also called 4-KByte aliasing.</li> <li>In all these cases the load is blocked until after the blocking store retires and the stored data is committed to the cache hierarchy.</li> </ul>  |
| 03H       | 10H         | LOAD_BLOCK.UNTIL_RETIRE | Loads blocked until retirement.  | This event indicates that load operations were blocked until retirement. The number of events is greater or equal to the number of load operations that were blocked. This includes mainly uncacheable loads and split loads (loads that cross the cache line boundary) but may include other cases where loads are blocked until retirement.  |
| 03H       | 20H         | LOAD_BLOCK.L1D          | Loads blocked by the L1 data cache.  | <p>This event indicates that loads are blocked due to one or more reasons. Some triggers for this event are:</p> <ul style="list-style-type: none"> <li>The number of L1 data cache misses exceeds the maximum number of outstanding misses supported by the processor. This includes misses generated as result of demand fetches, software prefetches or hardware prefetches.</li> <li>Cache line split loads.</li> <li>Partial reads, such as reads to un-cacheable memory, I/O instructions and more.</li> <li>A locked load operation is in progress. The number of events is greater or equal to the number of load operations that were blocked.</li> </ul>     |
| 04H       | 01H         | SB_DRAIN_CYCLES         | Cycles while stores are blocked due to store buffer drain.                   | <p>This event counts every cycle during which the store buffer is draining. This includes:</p> <ul style="list-style-type: none"> <li>Serializing operations such as CPUID</li> <li>Synchronizing operations such as XCHG</li> <li>Interrupt acknowledgment</li> <li>Other conditions, such as cache flushing</li> </ul>   |
| 04H       | 02H         | STORE_BLOCK.ORDER       | Cycles while store is waiting for a preceding store to be globally observed. | <p>This event counts the total duration, in number of cycles, which stores are waiting for a preceding stored cache line to be observed by other cores. This situation happens as a result of the strong store ordering behavior, as defined in “Memory Ordering,” Chapter 8, <i>Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A</i>.</p> <p>The stall may occur and be noticeable if there are many cases when a store either misses the L1 data cache or hits a cache line in the Shared state. If the store requires a bus transaction to read the cache line then the stall ends when snoop response for the bus transaction arrives.</p> |
| 04H       | 08H         | STORE_BLOCK.SNOOP       | A store is blocked due to a conflict with an external or internal snoop.     | This event counts the number of cycles the store port was used for snooping the L1 data cache and a store was stalled by the snoop. The store is typically resubmitted one cycle later.  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name             | Definition   | Description and Comment   |
|-----------|-------------|------------------------|--|---|
| 06H       | 00H         | SEGMENT_REG_LOADS      | Number of segment register loads.  | <p>This event counts the number of segment register load operations. Instructions that load new values into segment registers cause a penalty.</p> <p>This event indicates performance issues in 16-bit code. If this event occurs frequently, it may be useful to calculate the number of instructions retired per segment register load. If the resulting calculation is low (on average a small number of instructions are executed between segment register loads), then the code's segment register usage should be optimized.</p> <p>As a result of branch misprediction, this event is speculative and may include segment register loads that do not actually occur. However, most segment register loads are internally serialized and such speculative effects are minimized.</p> |
| 07H       | 00H         | SSE_PRE_EXEC.NTA       | Streaming SIMD Extensions (SSE) Prefetch NTA instructions executed.              | <p>This event counts the number of times the SSE instruction prefetchNTA is executed.</p> <p>This instruction prefetches the data to the L1 data cache.</p>   |
| 07H       | 01H         | SSE_PRE_EXEC.L1        | Streaming SIMD Extensions (SSE) PrefetchT0 instructions executed.                | This event counts the number of times the SSE instruction prefetchT0 is executed. This instruction prefetches the data to the L1 data cache and L2 cache.   |
| 07H       | 02H         | SSE_PRE_EXEC.L2        | Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions executed. | This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 are executed. These instructions prefetch the data to the L2 cache.  |
| 07H       | 03H         | SSE_PRE_EXEC.STORES    | Streaming SIMD Extensions (SSE) Weakly-ordered store instructions executed.      | This event counts the number of times SSE non-temporal store instructions are executed.   |
| 08H       | 01H         | DTLB_MISSES.ANY        | Memory accesses that missed the DTLB.  | <p>This event counts the number of Data Table Lookaside Buffer (DTLB) misses. The count includes misses detected as a result of speculative accesses.</p> <p>Typically a high count for this event indicates that the code accesses a large number of data pages.</p>   |
| 08H       | 02H         | DTLB_MISSES.MISS_LD    | DTLB misses due to load operations.  | <p>This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to load operations.</p> <p>This count includes misses detected as a result of speculative accesses.</p>  |
| 08H       | 04H         | DTLB_MISSES.L0_MISS_LD | L0 DTLB misses due to load operations.   | <p>This event counts the number of level 0 Data Table Lookaside Buffer (DTLB0) misses due to load operations.</p> <p>This count includes misses detected as a result of speculative accesses. Loads that miss that DTLB0 and hit the DTLB1 can incur two-cycle penalty.</p>   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                        | Definition                                       | Description and Comment  |
|-----------|-------------|-----------------------------------|--|--|
| 08H       | 08H         | DTLB_MISSES.<br>MISS_ST           | TLB misses due to store operations.              | <p>This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to store operations.</p> <p>This count includes misses detected as a result of speculative accesses. Address translation for store operations is performed in the DTLB1.</p>  |
| 09H       | 01H         | MEMORY_<br>DISAMBIGUATION.RESET   | Memory disambiguation reset cycles.              | <p>This event counts the number of cycles during which memory disambiguation misprediction occurs. As a result the execution pipeline is cleaned and execution of the mispredicted load instruction and all succeeding instructions restarts.</p> <p>This event occurs when the data address accessed by a load instruction, collides infrequently with preceding stores, but usually there is no collision. It happens rarely, and may have a penalty of about 20 cycles.</p>   |
| 09H       | 02H         | MEMORY_DISAMBIGUATIO<br>N.SUCCESS | Number of loads successfully disambiguated.      | This event counts the number of load operations that were successfully disambiguated. Loads are preceded by a store with an unknown address, but they are not blocked.   |
| 0CH       | 01H         | PAGE_WALKS.<br>.COUNT             | Number of page-walks executed.                   | <p>This event counts the number of page-walks executed due to either a DTLB or ITLB miss.</p> <p>The page walk duration, PAGE_WALKS.CYCLES, divided by number of page walks is the average duration of a page walk. The average can hint whether most of the page-walks are satisfied by the caches or cause an L2 cache miss.</p>   |
| 0CH       | 02H         | PAGE_WALKS.<br>CYCLES             | Duration of page-walks in core cycles.           | <p>This event counts the duration of page-walks in core cycles. The paging mode in use typically affects the duration of page walks.</p> <p>Page walk duration divided by number of page walks is the average duration of page-walks. The average can hint at whether most of the page-walks are satisfied by the caches or cause an L2 cache miss.</p>  |
| 10H       | 00H         | FP_COMP_OPS<br>_EXE               | Floating point computational micro-ops executed. | <p>This event counts the number of floating point computational micro-ops executed.</p> <p>Use IA32_PMC0 only.</p>   |
| 11H       | 00H         | FP_ASSIST                         | Floating point assists.                          | <p>This event counts the number of floating point operations executed that required micro-code assist intervention. Assists are required in the following cases:</p> <ul style="list-style-type: none"> <li>Streaming SIMD Extensions (SSE) instructions:</li> <li>Denormal input when the DAZ (Denormals Are Zeros) flag is off</li> <li>Underflow result when the FTZ (Flush To Zero) flag is off</li> <li>X87 instructions:</li> <li>NaN or denormal are loaded to a register or used as input from memory</li> <li>Division by 0</li> <li>Underflow output</li> </ul> <p>Use IA32_PMC1 only.</p> |
| 12H       | 00H         | MUL                               | Multiply operations executed.                    | <p>This event counts the number of multiply operations executed. This includes integer as well as floating point multiply operations.</p> <p>Use IA32_PMC1 only.</p>   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value     | Event Name             | Definition   | Description and Comment  |
|-----------|-----------------|------------------------|--|--|
| 13H       | 00H             | DIV                    | Divide operations executed.  | This event counts the number of divide operations executed. This includes integer divides, floating point divides and square-root operations executed.<br>Use IA32_PMC1 only.  |
| 14H       | 00H             | CYCLES_DIV_BUSY        | Cycles the divider busy.   | This event counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE.<br>Use IA32_PMC0 only.   |
| 18H       | 00H             | IDLE_DURING_DIV        | Cycles the divider is busy and all other execution units are idle. | This event counts the number of cycles the divider is busy (with a divide or a square root operation) and no other execution unit or load operation is in progress.<br>Load operations are assumed to hit the L1 data cache. This event considers only micro-ops dispatched after the divider started operating.<br>Use IA32_PMC0 only.                      |
| 19H       | 00H             | DELAYED_BYPASS.FP      | Delayed bypass to FP operation.                                    | This event counts the number of times floating point operations use data immediately after the data was generated by a non-floating point execution unit. Such cases result in one penalty cycle due to data bypass between the units.<br>Use IA32_PMC1 only.  |
| 19H       | 01H             | DELAYED_BYPASS.SIMD    | Delayed bypass to SIMD operation.                                  | This event counts the number of times SIMD operations use data immediately after the data was generated by a non-SIMD execution unit. Such cases result in one penalty cycle due to data bypass between the units.<br>Use IA32_PMC1 only.  |
| 19H       | 02H             | DELAYED_BYPASS.LOAD    | Delayed bypass to load operation.                                  | This event counts the number of delayed bypass penalty cycles that a load operation incurred.<br>When load operations use data immediately after the data was generated by an integer execution unit, they may (pending on certain dynamic internal conditions) incur one penalty cycle due to delayed data bypass between the units.<br>Use IA32_PMC1 only. |
| 21H       | See Table 18-61 | L2_ADS.(Core)          | Cycles L2 address bus is in use.                                   | This event counts the number of cycles the L2 address bus is being used for accesses to the L2 cache or bus queue. It can count occurrences for this core or both cores.   |
| 23H       | See Table 18-61 | L2_DBUS_BUSY_RD.(Core) | Cycles the L2 transfers data to the core.                          | This event counts the number of cycles during which the L2 data bus is busy transferring data from the L2 cache to the core. It counts for all L1 cache misses (data and instruction) that hit the L2 cache.<br>This event can count occurrences for this core or both cores.  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value  | Event Name                               | Definition                                | Description and Comment   |
|-----------|--|--|---|---|
| 24H       | Combined mask from Table 18-61 and Table 18-63               | L2_LINES_IN.<br>(Core, Prefetch)         | L2 cache misses.                          | <p>This event counts the number of cache lines allocated in the L2 cache. Cache lines are allocated in the L2 cache as a result of requests from the L1 data and instruction caches and the L2 hardware prefetchers to cache lines that are missing in the L2 cache.</p> <p>This event can count occurrences for this core or both cores. It can also count demand requests and L2 hardware prefetch requests together or separately.</p> |
| 25H       | See Table 18-61  | L2_M_LINES_IN.<br>(Core)                 | L2 cache line modifications.              | <p>This event counts whenever a modified cache line is written back from the L1 data cache to the L2 cache.</p> <p>This event can count occurrences for this core or both cores.</p>  |
| 26H       | See Table 18-61 and Table 18-63                              | L2_LINES_OUT.<br>(Core, Prefetch)        | L2 cache lines evicted.                   | <p>This event counts the number of L2 cache lines evicted.</p> <p>This event can count occurrences for this core or both cores. It can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.</p>  |
| 27H       | See Table 18-61 and Table 18-63                              | L2_M_LINES_OUT.(Core, Prefetch)          | Modified lines evicted from the L2 cache. | <p>This event counts the number of L2 modified cache lines evicted. These lines are written back to memory unless they also exist in a modified-state in one of the L1 data caches.</p> <p>This event can count occurrences for this core or both cores. It can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.</p>   |
| 28H       | Combined mask from Table 18-61 and Table 18-64               | L2_IFETCH.(Core, Cache Line State)       | L2 cacheable instruction fetch requests.  | <p>This event counts the number of instruction cache line requests from the IFU. It does not include fetch requests from uncacheable memory. It does not include ITLB miss accesses.</p> <p>This event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.</p>   |
| 29H       | Combined mask from Table 18-61, Table 18-63, and Table 18-64 | L2_LD.(Core, Prefetch, Cache Line State) | L2 cache reads.                           | <p>This event counts L2 cache read requests coming from the L1 data cache and L2 prefetchers.</p> <p>The event can count occurrences:</p> <ul style="list-style-type: none"> <li>For this core or both cores.</li> <li>Due to demand requests and L2 hardware prefetch requests together or separately.</li> <li>Of accesses to cache lines at different MESI states.</li> </ul>  |
| 2AH       | See Table 18-61 and Table 18-64                              | L2_ST.(Core, Cache Line State)           | L2 store requests.                        | <p>This event counts all store operations that miss the L1 data cache and request the data from the L2 cache.</p> <p>The event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.</p>   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value                                   | Event Name  | Definition  | Description and Comment   |
|-----------|---|---|---|---|
| 2BH       | See Table 18-61 and Table 18-64               | L2_LOCK.(Core, Cache Line State)                  | L2 locked accesses.   | This event counts all locked accesses to cache lines that miss the L1 data cache.<br><br>The event can count occurrences for this core or both cores. It can also count accesses to cache lines at different MESI states.   |
| 2EH       | See Table 18-61, Table 18-63, and Table 18-64 | L2_RQSTS.(Core, Prefetch, Cache Line State)       | L2 cache requests.  | This event counts all completed L2 cache requests. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, instruction fetches, and all L2 hardware prefetch requests.<br><br>This event can count occurrences: <ul style="list-style-type: none"> <li>For this core or both cores.</li> <li>Due to demand requests and L2 hardware prefetch requests together, or separately.</li> <li>Of accesses to cache lines at different MESI states.</li> </ul>  |
| 2EH       | 41H   | L2_RQSTS.SELF.DEMAND.I_STATE                      | L2 cache demand requests from this core that missed the L2.       | This event counts all completed L2 cache demand requests from this core that miss the L2 cache. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches.<br><br>This is an architectural performance event.  |
| 2EH       | 4FH   | L2_RQSTS.SELF.DEMAND.MESI                         | L2 cache demand requests from this core.                          | This event counts all completed L2 cache demand requests from this core. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches.<br><br>This is an architectural performance event.   |
| 30H       | See Table 18-61, Table 18-63, and Table 18-64 | L2_REJECT_BUSQ.(Core, Prefetch, Cache Line State) | Rejected L2 cache requests.                                       | This event indicates that a pending L2 cache request that requires a bus transaction is delayed from moving to the bus queue. Some of the reasons for this event are: <ul style="list-style-type: none"> <li>The bus queue is full.</li> <li>The bus queue already holds an entry for a cache line in the same set.</li> </ul> The number of events is greater or equal to the number of requests that were rejected. <ul style="list-style-type: none"> <li>For this core or both cores.</li> <li>Due to demand requests and L2 hardware prefetch requests together, or separately.</li> <li>Of accesses to cache lines at different MESI states.</li> </ul> |
| 32H       | See Table 18-61                               | L2_NO_REQ.(Core)                                  | Cycles no L2 cache requests are pending.                          | This event counts the number of cycles that no L2 cache requests were pending from a core. When using the BOTH_CORE modifier, the event counts only if none of the cores have a pending request. The event counts also when one core is halted and the other is not halted.<br><br>The event can count occurrences for this core or both cores.   |
| 3AH       | 00H   | EIST_TRANS  | Number of Enhanced Intel SpeedStep Technology (EIST) transitions. | This event counts the number of transitions that include a frequency change, either with or without voltage change. This includes Enhanced Intel SpeedStep Technology (EIST) and TM2 transitions.<br><br>The event is incremented only while the counting core is in C0 state. Since transitions to higher-numbered CxE states and TM2 transitions include a frequency change or voltage transition, the event is incremented accordingly.  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value     | Event Name                        | Definition  | Description and Comment   |
|-----------|-----------------|-----------------------------------|---|---|
| 3BH       | C0H             | THERMAL_TRIP                      | Number of thermal trips.                                | This event counts the number of thermal trips. A thermal trip occurs whenever the processor temperature exceeds the thermal trip threshold temperature.<br><br>Following a thermal trip, the processor automatically reduces frequency and voltage. The processor checks the temperature every millisecond and returns to normal when the temperature falls below the thermal trip threshold temperature.   |
| 3CH       | 00H             | CPU_CLK_UNHALTED.CORE_P           | Core cycles when core is not halted.                    | This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios.<br><br>The core frequency may change due to transitions associated with Enhanced Intel SpeedStep Technology or TM2. For this reason, this event may have a changing ratio in regard to time.<br><br>When the core frequency is constant, this event can give approximate elapsed time while the core not in halt state. This is an architectural performance event. |
| 3CH       | 01H             | CPU_CLK_UNHALTED.BUS              | Bus cycles when core is not halted.                     | This event counts the number of bus cycles while the core is not in the halt state. This event can give a measurement of the elapsed time while the core was not in the halt state. The core enters the halt state when it is running the HLT instruction.<br><br>The event also has a constant ratio with CPU_CLK_UNHALTED.REF event, which is the maximum bus to processor frequency ratio.<br><br>Non-halted bus cycles are a component in many key event ratios.  |
| 3CH       | 02H             | CPU_CLK_UNHALTED.NO_OTHER         | Bus cycles when core is active and the other is halted. | This event counts the number of bus cycles during which the core remains non-halted and the other core on the processor is halted.<br><br>This event can be used to determine the amount of parallelism exploited by an application or a system. Divide this event count by the bus frequency to determine the amount of time that only one core was in use.  |
| 40H       | See Table 18-64 | L1D_CACHE_LD.(Cache Line State)   | L1 cacheable data reads.                                | This event counts the number of data reads from cacheable memory. Locked reads are not counted.   |
| 41H       | See Table 18-64 | L1D_CACHE_ST.(Cache Line State)   | L1 cacheable data writes.                               | This event counts the number of data writes to cacheable memory. Locked writes are not counted.   |
| 42H       | See Table 18-64 | L1D_CACHE_LOCK.(Cache Line State) | L1 data cacheable locked reads.                         | This event counts the number of locked data reads from cacheable memory.  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name              | Definition  | Description and Comment   |
|-----------|-------------|-------------------------|---|---|
| 42H       | 10H         | L1D_CACHE_LOCK_DURATION | Duration of L1 data cacheable locked operation.                                     | This event counts the number of cycles during which any cache line is locked by any locking instruction.<br>Locking happens at retirement and therefore the event does not occur for instructions that are speculatively executed. Locking duration is shorter than locked instruction execution duration.  |
| 43H       | 01H         | L1D_ALL_REF             | All references to the L1 data cache.  | This event counts all references to the L1 data cache, including all loads and stores with any memory types.<br>The event counts memory accesses only when they are actually performed. For example, a load blocked by unknown store address and later performed is only counted once.<br>The event includes non-cacheable accesses, such as I/O accesses.  |
| 43H       | 02H         | L1D_ALL_CACHE_REF       | L1 Data cacheable reads and writes.   | This event counts the number of data reads and writes from cacheable memory, including locked operations.<br>This event is a sum of: <ul style="list-style-type: none"> <li>▪ L1D_CACHE_LD.MESI</li> <li>▪ L1D_CACHE_ST.MESI</li> <li>▪ L1D_CACHE_LOCK.MESI</li> </ul>  |
| 45H       | 0FH         | L1D_REPL                | Cache lines allocated in the L1 data cache.   | This event counts the number of lines brought into the L1 data cache.   |
| 46H       | 00H         | L1D_M_REPL              | Modified cache lines allocated in the L1 data cache.                                | This event counts the number of modified lines brought into the L1 data cache.  |
| 47H       | 00H         | L1D_M_EVICT             | Modified cache lines evicted from the L1 data cache.                                | This event counts the number of modified lines evicted from the L1 data cache, whether due to replacement or by snoop HITM intervention.  |
| 48H       | 00H         | L1D_PEND_MISS           | Total number of outstanding L1 data cache misses at any cycle.                      | This event counts the number of outstanding L1 data cache misses at any cycle. An L1 data cache miss is outstanding from the cycle on which the miss is determined until the first chunk of data is available. This event counts: <ul style="list-style-type: none"> <li>▪ All cacheable demand requests.</li> <li>▪ L1 data cache hardware prefetch requests.</li> <li>▪ Requests to write through memory.</li> <li>▪ Requests to write combine memory.</li> </ul> Uncacheable requests are not counted. The count of this event divided by the number of L1 data cache misses, L1D_REPL, is the average duration in core cycles of an L1 data cache miss. |
| 49H       | 01H         | L1D_SPLIT.LOADS         | Cache line split loads from the L1 data cache.                                      | This event counts the number of load operations that span two cache lines. Such load operations are also called split loads. Split load operations are executed at retirement.  |
| 49H       | 02H         | L1D_SPLIT.STORES        | Cache line split stores to the L1 data cache.                                       | This event counts the number of store operations that span two cache lines.   |
| 4BH       | 00H         | SSE_PRE_MISS.NTA        | Streaming SIMD Extensions (SSE) Prefetch NTA instructions missing all cache levels. | This event counts the number of times the SSE instructions prefetchNTA were executed and missed all cache levels.<br>Due to speculation an executed instruction might not retire. This instruction prefetches the data to the L1 data cache.  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value                      | Event Name  | Definition   | Description and Comment  |
|-----------|----------------------------------|---|--|--|
| 4BH       | 01H                              | SSE_PRE_MISS.L1                                   | Streaming SIMD Extensions (SSE) PrefetchT0 instructions missing all cache levels.                | This event counts the number of times the SSE instructions prefetchT0 were executed and missed all cache levels.<br>Due to speculation executed instruction might not retire.<br>The prefetchT0 instruction prefetches data to the L2 cache and L1 data cache.   |
| 4BH       | 02H                              | SSE_PRE_MISS.L2                                   | Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions missing all cache levels. | This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 were executed and missed all cache levels.<br>Due to speculation, an executed instruction might not retire.<br>The prefetchT1 and PrefetchNT2 instructions prefetch data to the L2 cache.   |
| 4CH       | 00H                              | LOAD_HIT_PRE                                      | Load operations conflicting with a software prefetch to the same address.                        | This event counts load operations sent to the L1 data cache while a previous Streaming SIMD Extensions (SSE) prefetch instruction to the same cache line has started prefetching but has not yet finished.   |
| 4EH       | 10H                              | L1D_PREFETCH.REQUESTS                             | L1 data cache prefetch requests.   | This event counts the number of times the L1 data cache requested to prefetch a data cache line. Requests can be rejected when the L2 cache is busy and resubmitted later or lost.<br>All requests are counted, including those that are rejected.   |
| 60H       | See Table 18-61 and Table 18-62. | BUS_REQUEST_OUTSTANDING.<br>(Core and Bus Agents) | Outstanding cacheable data read bus requests duration.   | This event counts the number of pending full cache line read transactions on the bus occurring in each cycle. A read transaction is pending from the cycle it is sent on the bus until the full cache line is received by the processor.<br>The event counts only full-line cacheable read requests from either the L1 data cache or the L2 prefetchers. It does not count Read for Ownership transactions, instruction byte fetch transactions, or any other bus transaction.   |
| 61H       | See Table 18-62.                 | BUS_BNR_DRV.<br>(Bus Agents)                      | Number of Bus Not Ready signals asserted.  | This event counts the number of Bus Not Ready (BNR) signals that the processor asserts on the bus to suspend additional bus requests by other bus agents.<br>A bus agent asserts the BNR signal when the number of data and snoop transactions is close to the maximum that the bus can handle. To obtain the number of bus cycles during which the BNR signal is asserted, multiply the event count by two.<br>While this signal is asserted, new transactions cannot be submitted on the bus. As a result, transaction latency may have higher impact on program performance.  |
| 62H       | See Table 18-62.                 | BUS_DRDY_CLOCKS.<br>(Bus Agents)                  | Bus cycles when data is sent on the bus.   | This event counts the number of bus cycles during which the DRDY (Data Ready) signal is asserted on the bus. The DRDY signal is asserted when data is sent on the bus. With the 'THIS_AGENT' mask this event counts the number of bus cycles during which this agent (the processor) writes data on the bus back to memory or to other bus agents. This includes all explicit and implicit data writebacks, as well as partial writes.<br>With the 'ALL_AGENTS' mask, this event counts the number of bus cycles during which any bus agent sends data on the bus. This includes all data reads and writes on the bus. |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Unmask Value                     | Event Name                              | Definition                                | Description and Comment   |
|-----------|----------------------------------|---|---|---|
| 63H       | See Table 18-61 and Table 18-62. | BUS_LOCK_CLOCKS.(Core and Bus Agents)   | Bus cycles when a LOCK signal asserted.   | This event counts the number of bus cycles, during which the LOCK signal is asserted on the bus. A LOCK signal is asserted when there is a locked memory access, due to: <ul style="list-style-type: none"> <li>▪ Uncacheable memory.</li> <li>▪ Locked operation that spans two cache lines.</li> <li>▪ Page-walk from an uncacheable page table.</li> </ul> Bus locks have a very high performance penalty and it is highly recommended to avoid such accesses. |
| 64H       | See Table 18-61.                 | BUS_DATA_RCV.(Core)                     | Bus cycles while processor receives data. | This event counts the number of bus cycles during which the processor is busy receiving data.   |
| 65H       | See Table 18-61 and Table 18-62. | BUS_TRANS_BRD.(Core and Bus Agents)     | Burst read bus transactions.              | This event counts the number of burst read transactions including: <ul style="list-style-type: none"> <li>▪ L1 data cache read misses (and L1 data cache hardware prefetches).</li> <li>▪ L2 hardware prefetches by the DPL and L2 streamer.</li> <li>▪ IFU read misses of cacheable lines.</li> </ul> It does not include RFO transactions.  |
| 66H       | See Table 18-61 and Table 18-62. | BUS_TRANS_RFO.(Core and Bus Agents)     | RFO bus transactions.                     | This event counts the number of Read For Ownership (RFO) bus transactions, due to store operations that miss the L1 data cache and the L2 cache. It also counts RFO bus transactions due to locked operations.  |
| 67H       | See Table 18-61 and Table 18-62. | BUS_TRANS_WB.(Core and Bus Agents)      | Explicit writeback bus transactions.      | This event counts all explicit writeback bus transactions due to dirty line evictions. It does not count implicit writebacks due to invalidation by a snoop request.  |
| 68H       | See Table 18-61 and Table 18-62. | BUS_TRANS_IFETCH.(Core and Bus Agents)  | Instruction-fetch bus transactions.       | This event counts all instruction fetch full cache line bus transactions.   |
| 69H       | See Table 18-61 and Table 18-62. | BUS_TRANS_INVALID.(Core and Bus Agents) | Invalidate bus transactions.              | This event counts all invalidate transactions. Invalidate transactions are generated when: <ul style="list-style-type: none"> <li>▪ A store operation hits a shared line in the L2 cache.</li> <li>▪ A full cache line write misses the L2 cache or hits a shared line in the L2 cache.</li> </ul>  |
| 6AH       | See Table 18-61 and Table 18-62. | BUS_TRANS_PWR.(Core and Bus Agents)     | Partial write bus transaction.            | This event counts partial write bus transactions.   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value                      | Event Name                             | Definition                                | Description and Comment   |
|-----------|----------------------------------|--|---|---|
| 6BH       | See Table 18-61 and Table 18-62. | BUS_TRANS_P.(Core and Bus Agents)      | Partial bus transactions.                 | This event counts all (read and write) partial bus transactions.  |
| 6CH       | See Table 18-61 and Table 18-62. | BUS_TRANS_IO.(Core and Bus Agents)     | IO bus transactions.                      | This event counts the number of completed I/O bus transactions as a result of IN and OUT instructions. The count does not include memory mapped IO.   |
| 6DH       | See Table 18-61 and Table 18-62. | BUS_TRANS_DEF.(Core and Bus Agents)    | Deferred bus transactions.                | This event counts the number of deferred transactions.  |
| 6EH       | See Table 18-61 and Table 18-62. | BUS_TRANS_BURST.(Core and Bus Agents)  | Burst (full cache-line) bus transactions. | This event counts burst (full cache line) transactions including: <ul style="list-style-type: none"> <li>▪ Burst reads.</li> <li>▪ RFOs.</li> <li>▪ Explicit writebacks.</li> <li>▪ Write combine lines.</li> </ul>   |
| 6FH       | See Table 18-61 and Table 18-62. | BUS_TRANS_MEM.(Core and Bus Agents)    | Memory bus transactions.                  | This event counts all memory bus transactions including: <ul style="list-style-type: none"> <li>▪ Burst transactions.</li> <li>▪ Partial reads and writes - invalidate transactions.</li> </ul> The BUS_TRANS_MEM count is the sum of BUS_TRANS_BURST, BUS_TRANS_P and BUS_TRANS_IVAL.  |
| 70H       | See Table 18-61 and Table 18-62. | BUS_TRANS_ANY.(Core and Bus Agents)    | All bus transactions.                     | This event counts all bus transactions. This includes: <ul style="list-style-type: none"> <li>▪ Memory transactions.</li> <li>▪ IO transactions (non memory-mapped).</li> <li>▪ Deferred transaction completion.</li> <li>▪ Other less frequent transactions, such as interrupts.</li> </ul>  |
| 77H       | See Table 18-61 and Table 18-65. | EXT_SNOOP.(Bus Agents, Snoop Response) | External snoops.                          | This event counts the snoop responses to bus transactions. Responses can be counted separately by type and by bus agent.<br><br>With the 'THIS_AGENT' mask, the event counts snoop responses from this processor to bus transactions sent by this processor. With the 'ALL_AGENTS' mask the event counts all snoop responses seen on the bus. |
| 78H       | See Table 18-61 and Table 18-66. | CMP_SNOOP.(Core, Snoop Type)           | L1 data cache snooped by other core.      | This event counts the number of times the L1 data cache is snooped for a cache line that is needed by the other core in the same processor. The cache line is either missing in the L1 instruction or data caches of the other core, or is available for reading only and the other core wishes to write the cache line.                      |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value                      | Event Name                                | Definition                            | Description and Comment  |
|-----------|----------------------------------|---|---------------------------------------|--|
|           |                                  |   |                                       | <p>The snoop operation may change the cache line state. If the other core issued a read request that hit this core in E state, typically the state changes to S state in this core. If the other core issued a read for ownership request (due a write miss or hit to S state) that hits this core's cache line in E or S state, this typically results in invalidation of the cache line in this core. If the snoop hits a line in M state, the state is changed at a later opportunity.</p> <p>These snoops are performed through the L1 data cache store port. Therefore, frequent snoops may conflict with extensive stores to the L1 data cache, which may increase store latency and impact performance.</p> |
| 7AH       | See Table 18-62.                 | BUS_HIT_DRV.<br>(Bus Agents)              | HIT signal asserted.                  | This event counts the number of bus cycles during which the processor drives the HIT# pin to signal HIT snoop response.  |
| 7BH       | See Table 18-62.                 | BUS_HITM_DRV.<br>(Bus Agents)             | HITM signal asserted.                 | This event counts the number of bus cycles during which the processor drives the HITM# pin to signal HITM snoop response.  |
| 7DH       | See Table 18-61.                 | BUSQ_EMPTY.<br>(Core)                     | Bus queue empty.                      | <p>This event counts the number of cycles during which the core did not have any pending transactions in the bus queue. It also counts when the core is halted and the other core is not halted.</p> <p>This event can count occurrences for this core or both cores.</p>  |
| 7EH       | See Table 18-61 and Table 18-62. | SNOOP_STALL_DRV.<br>(Core and Bus Agents) | Bus stalled for snoops.               | <p>This event counts the number of times that the bus snoop stall signal is asserted. To obtain the number of bus cycles during which snoops on the bus are prohibited, multiply the event count by two.</p> <p>During the snoop stall cycles, no new bus transactions requiring a snoop response can be initiated on the bus. A bus agent asserts a snoop stall signal if it cannot response to a snoop request within three bus cycles.</p>  |
| 7FH       | See Table 18-61.                 | BUS_IO_WAIT.<br>(Core)                    | IO requests waiting in the bus queue. | <p>This event counts the number of core cycles during which IO requests wait in the bus queue. With the SELF modifier this event counts IO requests per core.</p> <p>With the BOTH_CORE modifier, this event increments by one for any cycle for which there is a request from either core.</p>  |
| 80H       | 00H                              | L1I_READS                                 | Instruction fetches.                  | This event counts all instruction fetches, including uncacheable fetches that bypass the Instruction Fetch Unit (IFU).   |
| 81H       | 00H                              | L1I_MISSES                                | Instruction Fetch Unit misses.        | <p>This event counts all instruction fetches that miss the Instruction Fetch Unit (IFU) or produce memory requests. This includes uncacheable fetches.</p> <p>An instruction fetch miss is counted only once and not once for every cycle it is outstanding.</p>   |
| 82H       | 02H                              | ITLB.SMALL_MISS                           | ITLB small page misses.               | This event counts the number of instruction fetches from small pages that miss the ITLB.   |
| 82H       | 10H                              | ITLB.LARGE_MISS                           | ITLB large page misses.               | This event counts the number of instruction fetches from large pages that miss the ITLB.   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name             | Definition   | Description and Comment   |
|-----------|-------------|------------------------|--|---|
| 82H       | 40H         | ITLB.FLUSH             | ITLB flushes.  | This event counts the number of ITLB flushes. This usually happens upon CR3 or CR0 writes, which are executed by the operating system during process switches.  |
| 82H       | 12H         | ITLB.MISSES            | ITLB misses.   | This event counts the number of instruction fetches from either small or large pages that miss the ITLB.  |
| 83H       | 02H         | INST_QUEUE.FULL        | Cycles during which the instruction queue is full.                       | This event counts the number of cycles during which the instruction queue is full. In this situation, the core front end stops fetching more instructions. This is an indication of very long stalls in the back-end pipeline stages.   |
| 86H       | 00H         | CYCLES_L1L_MEM_STALLED | Cycles during which instruction fetches stalled.                         | This event counts the number of cycles for which an instruction fetch stalls, including stalls due to any of the following reasons: <ul style="list-style-type: none"> <li>▪ Instruction Fetch Unit cache misses.</li> <li>▪ Instruction TLB misses.</li> <li>▪ Instruction TLB faults.</li> </ul>  |
| 87H       | 00H         | ILD_STALL              | Instruction Length Decoder stall cycles due to a length changing prefix. | This event counts the number of cycles during which the instruction length decoder uses the slow length decoder. Usually, instruction length decoding is done in one cycle. When the slow decoder is used, instruction decoding requires 6 cycles.<br><br>The slow decoder is used in the following cases: <ul style="list-style-type: none"> <li>▪ Operand override prefix (66H) preceding an instruction with immediate data.</li> <li>▪ Address override prefix (67H) preceding an instruction with a modr/m in real, big real, 16-bit protected or 32-bit protected modes.</li> </ul> To avoid instruction length decoding stalls, generate code using imm8 or imm32 values instead of imm16 values. If you must use an imm16 value, store the value in a register using “mov reg, imm32” and use the register format of the instruction. |
| 88H       | 00H         | BR_INST_EXEC           | Branch instructions executed.  | This event counts all executed branches (not necessarily retired). This includes only instructions and not micro-op branches.<br><br>Frequent branching is not necessarily a major performance issue. However frequent branch mispredictions may be a problem.  |
| 89H       | 00H         | BR_MISSP_EXEC          | Mispredicted branch instructions executed.                               | This event counts the number of mispredicted branch instructions that were executed.  |
| 8AH       | 00H         | BR_BAC_MISSP_EXEC      | Branch instructions mispredicted at decoding.                            | This event counts the number of branch instructions that were mispredicted at decoding.   |
| 8BH       | 00H         | BR_CND_EXEC            | Conditional branch instructions executed.                                | This event counts the number of conditional branch instructions executed, but not necessarily retired.  |
| 8CH       | 00H         | BR_CND_MISSP_EXEC      | Mispredicted conditional branch instructions executed.                   | This event counts the number of mispredicted conditional branch instructions that were executed.  |
| 8DH       | 00H         | BR_IND_EXEC            | Indirect branch instructions executed.                                   | This event counts the number of indirect branch instructions that were executed.  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name               | Definition   | Description and Comment  |
|-----------|-------------|--------------------------|--|--|
| 8EH       | 00H         | BR_IND_MISSP_EXEC        | Mispredicted indirect branch instructions executed.  | This event counts the number of mispredicted indirect branch instructions that were executed.  |
| 8FH       | 00H         | BR_RET_EXEC              | RET instructions executed.                           | This event counts the number of RET instructions that were executed.   |
| 90H       | 00H         | BR_RET_MISSP_EXEC        | Mispredicted RET instructions executed.              | This event counts the number of mispredicted RET instructions that were executed.  |
| 91H       | 00H         | BR_RET_BAC_MISSP_EXEC    | RET instructions executed mispredicted at decoding.  | This event counts the number of RET instructions that were executed and were mispredicted at decoding.   |
| 92H       | 00H         | BR_CALL_EXEC             | CALL instructions executed.                          | This event counts the number of CALL instructions executed.  |
| 93H       | 00H         | BR_CALL_MISSP_EXEC       | Mispredicted CALL instructions executed.             | This event counts the number of mispredicted CALL instructions that were executed.   |
| 94H       | 00H         | BR_IND_CALL_EXEC         | Indirect CALL instructions executed.                 | This event counts the number of indirect CALL instructions that were executed.   |
| 97H       | 00H         | BR_TKN_BUBBLE_1          | Branch predicted taken with bubble 1.                | The events BR_TKN_BUBBLE_1 and BR_TKN_BUBBLE_2 together count the number of times a taken branch prediction incurred a one-cycle penalty. The penalty incurs when: <ul style="list-style-type: none"> <li>Too many taken branches are placed together. To avoid this, unroll loops and add a non-taken branch in the middle of the taken sequence.</li> <li>The branch target is unaligned. To avoid this, align the branch target.</li> </ul> |
| 98H       | 00H         | BR_TKN_BUBBLE_2          | Branch predicted taken with bubble 2.                | The events BR_TKN_BUBBLE_1 and BR_TKN_BUBBLE_2 together count the number of times a taken branch prediction incurred a one-cycle penalty. The penalty incurs when: <ul style="list-style-type: none"> <li>Too many taken branches are placed together. To avoid this, unroll loops and add a non-taken branch in the middle of the taken sequence.</li> <li>The branch target is unaligned. To avoid this, align the branch target.</li> </ul> |
| A0H       | 00H         | RS_UOPS_DISPATCHED       | Micro-ops dispatched for execution.                  | This event counts the number of micro-ops dispatched for execution. Up to six micro-ops can be dispatched in each cycle.   |
| A1H       | 01H         | RS_UOPS_DISPATCHED.PORT0 | Cycles micro-ops dispatched for execution on port 0. | This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Issue Ports are described in <i>Intel® 64 and IA-32 Architectures Optimization Reference Manual</i> . Use IA32_PMC0 only.   |
| A1H       | 02H         | RS_UOPS_DISPATCHED.PORT1 | Cycles micro-ops dispatched for execution on port 1. | This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.   |
| A1H       | 04H         | RS_UOPS_DISPATCHED.PORT2 | Cycles micro-ops dispatched for execution on port 2. | This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                 | Definition   | Description and Comment  |
|-----------|-------------|----------------------------|--|--|
| A1H       | 08H         | RS_UOPS_DISPATCHED.PORT3   | Cycles micro-ops dispatched for execution on port 3. | This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.   |
| A1H       | 10H         | RS_UOPS_DISPATCHED.PORT4   | Cycles micro-ops dispatched for execution on port 4. | This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.   |
| A1H       | 20H         | RS_UOPS_DISPATCHED.PORT5   | Cycles micro-ops dispatched for execution on port 5. | This event counts the number of cycles for which micro-ops dispatched for execution. Each cycle, at most one micro-op can be dispatched on the port. Use IA32_PMC0 only.   |
| AAH       | 01H         | MACRO_INSTS_DECODED        | Instructions decoded.                                | This event counts the number of instructions decoded (but not necessarily executed or retired).  |
| AAH       | 08H         | MACRO_INSTS_CISC_DECODED   | CISC Instructions decoded.                           | This event counts the number of complex instructions decoded. Complex instructions usually have more than four micro-ops. Only one complex instruction can be decoded at a time.   |
| ABH       | 01H         | ESP.SYNCH                  | ESP register content synchron-ization.               | This event counts the number of times that the ESP register is explicitly used in the address expression of a load or store operation, after it is implicitly used, for example by a push or a pop instruction.<br><br>ESP synch micro-op uses resources from the rename pipe-stage and up to retirement. The expected ratio of this event divided by the number of ESP implicit changes is 0.2. If the ratio is higher, consider rearranging your code to avoid ESP synchronization events. |
| ABH       | 02H         | ESP.ADDITIONS              | ESP register automatic additions.                    | This event counts the number of ESP additions performed automatically by the decoder. A high count of this event is good, since each automatic addition performed by the decoder saves a micro-op from the execution units.<br><br>To maximize the number of ESP additions performed automatically by the decoder, choose instructions that implicitly use the ESP, such as PUSH, POP, CALL, and RET instructions whenever possible.   |
| B0H       | 00H         | SIMD_UOPS_EXEC             | SIMD micro-ops executed (excluding stores).          | This event counts all the SIMD micro-ops executed. It does not count MOVQ and MOVD stores from register to memory.   |
| B1H       | 00H         | SIMD_SAT_UOP_EXEC          | SIMD saturated arithmetic micro-ops executed.        | This event counts the number of SIMD saturated arithmetic micro-ops executed.  |
| B3H       | 01H         | SIMD_UOP_TYPE_EXEC.MUL     | SIMD packed multiply micro-ops executed.             | This event counts the number of SIMD packed multiply micro-ops executed.   |
| B3H       | 02H         | SIMD_UOP_TYPE_EXEC.SHIFT   | SIMD packed shift micro-ops executed.                | This event counts the number of SIMD packed shift micro-ops executed.  |
| B3H       | 04H         | SIMD_UOP_TYPE_EXEC.PACK    | SIMD pack micro-ops executed.                        | This event counts the number of SIMD pack micro-ops executed.  |
| B3H       | 08H         | SIMD_UOP_TYPE_EXEC.UNPACK  | SIMD unpack micro-ops executed.                      | This event counts the number of SIMD unpack micro-ops executed.  |
| B3H       | 10H         | SIMD_UOP_TYPE_EXEC.LOGICAL | SIMD packed logical micro-ops executed.              | This event counts the number of SIMD packed logical micro-ops executed.  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                    | Definition   | Description and Comment  |
|-----------|-------------|-------------------------------|--|--|
| B3H       | 20H         | SIMD_UOP_TYPE_EXEC.ARITHMETIC | SIMD packed arithmetic micro-ops executed.                       | This event counts the number of SIMD packed arithmetic micro-ops executed.   |
| COH       | 00H         | INST_RETIRED.ANY_P            | Instructions retired.  | This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers. INST_RETIRED.ANY_P is an architectural performance event.  |
| COH       | 01H         | INST_RETIRED.LOADS            | Instructions retired, which contain a load.                      | This event counts the number of instructions retired that contain a load operation.  |
| COH       | 02H         | INST_RETIRED.STORES           | Instructions retired, which contain a store.                     | This event counts the number of instructions retired that contain a store operation.   |
| COH       | 04H         | INST_RETIRED.OTHER            | Instructions retired, with no load or store operation.           | This event counts the number of instructions retired that do not contain a load or a store operation.  |
| C1H       | 01H         | X87_OPS_RETIRED.FXCH          | FXCH instructions retired.                                       | This event counts the number of FXCH instructions retired. Modern compilers generate more efficient code and are less likely to use this instruction. If you obtain a high count for this event consider recompiling the code.   |
| C1H       | FEH         | X87_OPS_RETIRED.ANY           | Retired floating-point computational operations (precise event). | <p>This event counts the number of floating-point computational operations retired. It counts:</p> <ul style="list-style-type: none"> <li>Floating point computational operations executed by the assist handler.</li> <li>Sub-operations of complex floating-point instructions like transcendental instructions.</li> </ul> <p>This event does not count:</p> <ul style="list-style-type: none"> <li>Floating-point computational operations that cause traps or assists.</li> <li>Floating-point loads and stores.</li> </ul> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p>  |
| C2H       | 01H         | UOPS_RETIRED.LD_IND_BR        | Fused load+op or load+indirect branch retired.                   | <p>This event counts the number of retired micro-ops that fused a load with another operation. This includes:</p> <ul style="list-style-type: none"> <li>Fusion of a load and an arithmetic operation, such as with the following instruction: ADD EAX, [EBX] where the content of the memory location specified by EBX register is loaded, added to EAX register, and the result is stored in EAX.</li> <li>Fusion of a load and a branch in an indirect branch operation, such as with the following instructions: <ul style="list-style-type: none"> <li>JMP [RDI+200]</li> <li>RET</li> </ul> </li> <li>Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively.</li> </ul> |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                    | Definition   | Description and Comment  |
|-----------|-------------|-------------------------------|--|--|
| C2H       | 02H         | UOPS_RETIRED.<br>STD_STA      | Fused store address + data retired.                | This event counts the number of store address calculations that are fused with store data emission into one micro-op. Traditionally, each store operation required two micro-ops. This event counts fusion of retired micro-ops only. Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively.  |
| C2H       | 04H         | UOPS_RETIRED.<br>MACRO_FUSION | Retired instruction pairs fused into one micro-op. | This event counts the number of times CMP or TEST instructions were fused with a conditional branch instruction into one micro-op. It counts fusion by retired micro-ops only. Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code uses the processor resources more effectively.  |
| C2H       | 07H         | UOPS_RETIRED.<br>FUSED        | Fused micro-ops retired.                           | This event counts the total number of retired fused micro-ops. The counts include the following fusion types: <ul style="list-style-type: none"> <li>▪ Fusion of load operation with an arithmetic operation or with an indirect branch (counted by event UOPS_RETIRED.LD_IND_BR)</li> <li>▪ Fusion of store address and data (counted by event UOPS_RETIRED.STD_STA)</li> <li>▪ Fusion of CMP or TEST instruction with a conditional branch instruction (counted by event UOPS_RETIRED.MACRO_FUSION)</li> </ul> Fusion decreases the number of micro-ops in the processor pipeline. A high value for this event count indicates that the code is using the processor resources effectively. |
| C2H       | 08H         | UOPS_RETIRED.<br>NON_FUSED    | Non-fused micro-ops retired.                       | This event counts the number of micro-ops retired that were not fused.   |
| C2H       | 0FH         | UOPS_RETIRED.<br>ANY          | Micro-ops retired.                                 | This event counts the number of micro-ops retired. The processor decodes complex macro instructions into a sequence of simpler micro-ops. Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists. In some cases micro-op sequences are fused or whole instructions are fused into one micro-op. See other UOPS_RETIRED events for differentiating retired fused and non-fused micro-ops.   |
| C3H       | 01H         | MACHINE_<br>NUKES.SMC         | Self-Modifying Code detected.                      | This event counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel 64 and IA-32 processors.   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                             | Definition   | Description and Comment   |
|-----------|-------------|--|--|---|
| C3H       | 04H         | MACHINE_NUKES.MEM_ORDER                | Execution pipeline restart due to memory ordering conflict or memory disambiguation misprediction. | This event counts the number of times the pipeline is restarted due to either multi-threaded memory ordering conflicts or memory disambiguation misprediction.<br><br>A multi-threaded memory ordering conflict occurs when a store, which is executed in another core, hits a load that is executed out of order in this core but not yet retired. As a result, the load needs to be restarted to satisfy the memory ordering model.<br><br>See Chapter 8, "Multiple-Processor Management" in the <i>Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A</i> .<br><br>To count memory disambiguation mispredictions, use the event MEMORY_DISAMBIGUATION.RESET. |
| C4H       | 00H         | BR_INST_RETIRED.ANY                    | Retired branch instructions.   | This event counts the number of branch instructions retired. This is an architectural performance event.  |
| C4H       | 01H         | BR_INST_RETIRED.PRED_NOT_TAKEN         | Retired branch instructions that were predicted not-taken.   | This event counts the number of branch instructions retired that were correctly predicted to be not-taken.  |
| C4H       | 02H         | BR_INST_RETIRED.MISPREDICTED_NOT_TAKEN | Retired branch instructions that were mispredicted not-taken.                                      | This event counts the number of branch instructions retired that were mispredicted and not-taken.   |
| C4H       | 04H         | BR_INST_RETIRED.PRED_TAKEN             | Retired branch instructions that were predicted taken.   | This event counts the number of branch instructions retired that were correctly predicted to be taken.  |
| C4H       | 08H         | BR_INST_RETIRED.MISPREDICTED_TAKEN     | Retired branch instructions that were mispredicted taken.  | This event counts the number of branch instructions retired that were mispredicted and taken.   |
| C4H       | 0CH         | BR_INST_RETIRED.TAKEN                  | Retired taken branch instructions.   | This event counts the number of branches retired that were taken.   |
| C5H       | 00H         | BR_INST_RETIRED.MISPREDICTED           | Retired mispredicted branch instructions. (precise event)  | This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa.<br><br>This is an architectural performance event.   |
| C6H       | 01H         | CYCLES_INT_MASKED                      | Cycles during which interrupts are disabled.   | This event counts the number of cycles during which interrupts are disabled.  |
| C6H       | 02H         | CYCLES_INT_PENDING_AND_MASKED          | Cycles during which interrupts are pending and disabled.   | This event counts the number of cycles during which there are pending interrupts but interrupts are disabled.   |
| C7H       | 01H         | SIMD_INST_RETIRED.PACKED_SINGLE        | Retired SSE packed-single instructions.  | This event counts the number of SSE packed-single instructions retired.   |
| C7H       | 02H         | SIMD_INST_RETIRED.SCALAR_SINGLE        | Retired SSE scalar-single instructions.  | This event counts the number of SSE scalar-single instructions retired.   |
| C7H       | 04H         | SIMD_INST_RETIRED.PACKED_DOUBLE        | Retired SSE2 packed-double instructions.   | This event counts the number of SSE2 packed-double instructions retired.  |
| C7H       | 08H         | SIMD_INST_RETIRED.SCALAR_DOUBLE        | Retired SSE2 scalar-double instructions.   | This event counts the number of SSE2 scalar-double instructions retired.  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                            | Definition   | Description and Comment  |
|-----------|-------------|---------------------------------------|--|--|
| C7H       | 10H         | SIMD_INST_RETIRE.D.VECTOR             | Retired SSE2 vector integer instructions.              | This event counts the number of SSE2 vector integer instructions retired.  |
| C7H       | 1FH         | SIMD_INST_RETIRE.ANY                  | Retired Streaming SIMD instructions (precise event).   | <p>This event counts the overall number of retired SIMD instructions that use XMM registers. To count each type of SIMD instruction separately, use the following events:</p> <ul style="list-style-type: none"> <li>▪ SIMD_INST_RETIRE.PACKED_SINGLE</li> <li>▪ SIMD_INST_RETIRE.SCALAR_SINGLE</li> <li>▪ SIMD_INST_RETIRE.PACKED_DOUBLE</li> <li>▪ SIMD_INST_RETIRE.SCALAR_DOUBLE</li> <li>▪ and SIMD_INST_RETIRE.VECTOR</li> </ul> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> |
| C8H       | 00H         | HW_INT_RCV                            | Hardware interrupts received.                          | This event counts the number of hardware interrupts received by the processor.   |
| C9H       | 00H         | ITLB_MISS_RETIRE                      | Retired instructions that missed the ITLB.             | This event counts the number of retired instructions that missed the ITLB when they were fetched.  |
| CAH       | 01H         | SIMD_COMP_INST_RETIRE.PACKED_SINGLE   | Retired computational SSE packed-single instructions.  | <p>This event counts the number of computational SSE packed-single instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide).</p> <p>Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.</p>  |
| CAH       | 02H         | SIMD_COMP_INST_RETIRE.SCALAR_SINGLE   | Retired computational SSE scalar-single instructions.  | <p>This event counts the number of computational SSE scalar-single instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide).</p> <p>Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.</p>  |
| CAH       | 04H         | SIMD_COMP_INST_RETIRE.PACKED_DOUBLE   | Retired computational SSE2 packed-double instructions. | <p>This event counts the number of computational SSE2 packed-double instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide).</p> <p>Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.</p>   |
| CAH       | 08H         | SIMD_COMP_INST_RETIRE.D.SCALAR_DOUBLE | Retired computational SSE2 scalar-double instructions. | <p>This event counts the number of computational SSE2 scalar-double instructions retired. Computational instructions perform arithmetic computations (for example: add, multiply and divide).</p> <p>Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.</p>   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                      | Definition  | Description and Comment  |
|-----------|-------------|---------------------------------|---|--|
| CBH       | 01H         | MEM_LOAD_RETIREDD.L1D_MISS      | Retired loads that miss the L1 data cache (precise event).  | <p>This event counts the number of retired load operations that missed the L1 data cache. This includes loads from cache lines that are currently being fetched, due to a previous L1 data cache miss to the same cache line.</p> <p>This event counts loads from cacheable memory only. The event does not count loads by software prefetches.</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p>  |
| CBH       | 02H         | MEM_LOAD_RETIREDD.L1D_LINE_MISS | L1 data cache line missed by retired loads (precise event). | <p>This event counts the number of load operations that miss the L1 data cache and send a request to the L2 cache to fetch the missing cache line. That is the missing cache line fetching has not yet started.</p> <p>The event count is equal to the number of cache lines fetched from the L2 cache by retired loads.</p> <p>This event counts loads from cacheable memory only. The event does not count loads by software prefetches.</p> <p>The event might not be counted if the load is blocked (see LOAD_BLOCK events).</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p> |
| CBH       | 04H         | MEM_LOAD_RETIREDD.L2_MISS       | Retired loads that miss the L2 cache (precise event).       | <p>This event counts the number of retired load operations that missed the L2 cache.</p> <p>This event counts loads from cacheable memory only. It does not count loads by software prefetches.</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p>  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                    | Definition  | Description and Comment   |
|-----------|-------------|-------------------------------|---|---|
| CBH       | 08H         | MEM_LOAD_RETIRED.L2_LINE_MISS | L2 cache line missed by retired loads (precise event).            | <p>This event counts the number of load operations that miss the L2 cache and result in a bus request to fetch the missing cache line. That is the missing cache line fetching has not yet started.</p> <p>This event count is equal to the number of cache lines fetched from memory by retired loads.</p> <p>This event counts loads from cacheable memory only. The event does not count loads by software prefetches.</p> <p>The event might not be counted if the load is blocked (see LOAD_BLOCK events).</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p> |
| CBH       | 10H         | MEM_LOAD_RETIRED.DTLB_MISS    | Retired loads that miss the DTLB (precise event).                 | <p>This event counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault.</p> <p>This event counts loads from cacheable memory only. The event does not count loads by software prefetches.</p> <p>When this event is captured with the precise event mechanism, the collected samples contain the address of the instruction that was executed immediately after the instruction that caused the event.</p> <p>Use IA32_PMC0 only.</p>   |
| CCH       | 01H         | FP_MMX_TRANS_TO_MMX           | Transitions from Floating Point to MMX Instructions.              | This event counts the first MMX instructions following a floating-point instruction. Use this event to estimate the penalties for the transitions between floating-point and MMX states.  |
| CCH       | 02H         | FP_MMX_TRANS_TO_FP            | Transitions from MMX Instructions to Floating Point Instructions. | This event counts the first floating-point instructions following any MMX instruction. Use this event to estimate the penalties for the transitions between floating-point and MMX states.  |
| CDH       | 00H         | SIMD_ASSIST                   | SIMD assists invoked.   | This event counts the number of SIMD assists invoked. SIMD assists are invoked when an EMMS instruction is executed, changing the MMX state in the floating point stack.  |
| CEH       | 00H         | SIMD_INSTR_RETIRED            | SIMD Instructions retired.  | This event counts the number of retired SIMD instructions that use MMX registers.   |
| CFH       | 00H         | SIMD_SAT_INSTR_RETIRED        | Saturated arithmetic instructions retired.                        | This event counts the number of saturated arithmetic SIMD instructions that retired.  |
| D2H       | 01H         | RAT_STALLS.ROB_READ_PORT      | ROB read port stalls cycles.                                      | <p>This event counts the number of cycles when ROB read port stalls occurred, which did not allow new micro-ops to enter the out-of-order pipeline.</p> <p>Note that, at this stage in the pipeline, additional stalls may occur at the same cycle and prevent the stalled micro-ops from entering the pipe. In such a case, micro-ops retry entering the execution pipe in the next cycle and the ROB-read-port stall is counted again.</p>  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                | Definition                              | Description and Comment  |
|-----------|-------------|---------------------------|---|--|
| D2H       | 02H         | RAT_STALLS.PARTIAL_CYCLES | Partial register stall cycles.          | This event counts the number of cycles instruction execution latency became longer than the defined latency because the instruction uses a register that was partially written by previous instructions.   |
| D2H       | 04H         | RAT_STALLS.FLAGS          | Flag stall cycles.                      | <p>This event counts the number of cycles during which execution stalled due to several reasons, one of which is a partial flag register stall.</p> <p>A partial register stall may occur when two conditions are met:</p> <ul style="list-style-type: none"> <li>▪ An instruction modifies some, but not all, of the flags in the flag register.</li> <li>▪ The next instruction, which depends on flags, depends on flags that were not modified by this instruction.</li> </ul> |
| D2H       | 08H         | RAT_STALLS.FPSW           | FPU status word stall.                  | <p>This event indicates that the FPU status word (FPSW) is written. To obtain the number of times the FPSW is written divide the event count by 2.</p> <p>The FPSW is written by instructions with long latency; a small count may indicate a high penalty.</p>  |
| D2H       | 0FH         | RAT_STALLS.ANY            | All RAT stall cycles.                   | <p>This event counts the number of stall cycles due to conditions described by:</p> <ul style="list-style-type: none"> <li>▪ RAT_STALLS.ROB_READ_PORT</li> <li>▪ RAT_STALLS.PARTIAL</li> <li>▪ RAT_STALLS.FLAGS</li> <li>▪ RAT_STALLS.FPSW.</li> </ul>   |
| D4H       | 01H         | SEG_RENAME_STALLS.ES      | Segment rename stalls - ES.             | This event counts the number of stalls due to the lack of renaming resources for the ES segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.  |
| D4H       | 02H         | SEG_RENAME_STALLS.DS      | Segment rename stalls - DS.             | This event counts the number of stalls due to the lack of renaming resources for the DS segment register. If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.  |
| D4H       | 04H         | SEG_RENAME_STALLS.FS      | Segment rename stalls - FS.             | <p>This event counts the number of stalls due to the lack of renaming resources for the FS segment register.</p> <p>If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.</p>  |
| D4H       | 08H         | SEG_RENAME_STALLS.GS      | Segment rename stalls - GS.             | <p>This event counts the number of stalls due to the lack of renaming resources for the GS segment register.</p> <p>If a segment is renamed, but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.</p>  |
| D4H       | 0FH         | SEG_RENAME_STALLS.ANY     | Any (ES/DS/FS/GS) segment rename stall. | <p>This event counts the number of stalls due to the lack of renaming resources for the ES, DS, FS, and GS segment registers.</p> <p>If a segment is renamed but not retired and a second update to the same segment occurs, a stall occurs in the front end of the pipeline until the renamed segment retires.</p>  |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name                    | Definition   | Description and Comment  |
|-----------|-------------|-------------------------------|--|--|
| D5H       | 01H         | SEG_REG_RENAMES.ES            | Segment renames - ES.  | This event counts the number of times the ES segment register is renamed.  |
| D5H       | 02H         | SEG_REG_RENAMES.DS            | Segment renames - DS.  | This event counts the number of times the DS segment register is renamed.  |
| D5H       | 04H         | SEG_REG_RENAMES.FS            | Segment renames - FS.  | This event counts the number of times the FS segment register is renamed.  |
| D5H       | 08H         | SEG_REG_RENAMES.GS            | Segment renames - GS.  | This event counts the number of times the GS segment register is renamed.  |
| D5H       | 0FH         | SEG_REG_RENAMES.ANY           | Any (ES/DS/FS/GS) segment rename.  | This event counts the number of times any of the four segment registers (ES/DS/FS/GS) is renamed.  |
| DCH       | 01H         | RESOURCE_STALLS.ROB_FULL      | Cycles during which the ROB full.  | <p>This event counts the number of cycles when the number of instructions in the pipeline waiting for retirement reaches the limit the processor can handle.</p> <p>A high count for this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, and other instructions that depend on these cannot execute until the former instructions complete execution). In this situation new instructions cannot enter the pipe and start execution.</p>   |
| DCH       | 02H         | RESOURCE_STALLS.RS_FULL       | Cycles during which the RS full.   | <p>This event counts the number of cycles when the number of instructions in the pipeline waiting for execution reaches the limit the processor can handle.</p> <p>A high count of this event indicates that there are long latency operations in the pipe (possibly load and store operations that miss the L2 cache, and other instructions that depend on these cannot execute until the former instructions complete execution). In this situation new instructions cannot enter the pipe and start execution.</p>   |
| DCH       | 04          | RESOURCE_STALLS.LD_ST         | Cycles during which the pipeline has exceeded load or store limit or waiting to commit all stores. | <p>This event counts the number of cycles while resource-related stalls occur due to:</p> <ul style="list-style-type: none"> <li>▪ The number of load instructions in the pipeline reached the limit the processor can handle. The stall ends when a loading instruction retires.</li> <li>▪ The number of store instructions in the pipeline reached the limit the processor can handle. The stall ends when a storing instruction commits its data to the cache or memory.</li> <li>▪ There is an instruction in the pipe that can be executed only when all previous stores complete and their data is committed in the caches or memory. For example, the SFENCE and MFENCE instructions require this behavior.</li> </ul> |
| DCH       | 08H         | RESOURCE_STALLS.FPCW          | Cycles stalled due to FPU control word write.  | This event counts the number of cycles while execution was stalled due to writing the floating-point unit (FPU) control word.  |
| DCH       | 10H         | RESOURCE_STALLS.BR_MISS_CLEAR | Cycles stalled due to branch misprediction.  | This event counts the number of cycles after a branch misprediction is detected at execution until the branch and all older micro-ops retire. During this time new micro-ops cannot enter the out-of-order pipeline.   |

**Table 19-25. Performance Events in Processors Based on Intel® Core™ Microarchitecture (Contd.)**

| Event Num | Umask Value | Event Name          | Definition                           | Description and Comment  |
|-----------|-------------|---------------------|--------------------------------------|--|
| DCH       | 1FH         | RESOURCE_STALLS.ANY | Resource related stalls.             | This event counts the number of cycles while resource-related stalls occurs for any conditions described by the following events: <ul style="list-style-type: none"> <li>RESOURCE_STALLS.ROB_FULL</li> <li>RESOURCE_STALLS.RS_FULL</li> <li>RESOURCE_STALLS.ID_ST</li> <li>RESOURCE_STALLS.FPCW</li> <li>RESOURCE_STALLS.BR_MISS_CLEAR</li> </ul>  |
| E0H       | 00H         | BR_INST_DECODED     | Branch instructions decoded.         | This event counts the number of branch instructions decoded.   |
| E4H       | 00H         | BOGUS_BR            | Bogus branches.                      | This event counts the number of byte sequences that were mistakenly detected as taken branch instructions. This results in a BACLEAR event. This occurs mainly after task switches.  |
| E6H       | 00H         | BACLEARS            | BACLEARS asserted.                   | This event counts the number of times the front end is resteered, mainly when the BPU cannot provide a correct prediction and this is corrected by other branch handling mechanisms at the front and. This can occur if the code has many branches such that they cannot be consumed by the BPU.<br><br>Each BACLEAR asserted costs approximately 7 cycles of instruction fetch. The effect on total execution time depends on the surrounding code. |
| F0H       | 00H         | PREF_RQSTS_UP       | Upward prefetches issued from DPL.   | This event counts the number of upward prefetches issued from the Data Prefetch Logic (DPL) to the L2 cache. A prefetch request issued to the L2 cache cannot be cancelled and the requested cache line is fetched to the L2 cache.  |
| F8H       | 00H         | PREF_RQSTS_DN       | Downward prefetches issued from DPL. | This event counts the number of downward prefetches issued from the Data Prefetch Logic (DPL) to the L2 cache. A prefetch request issued to the L2 cache cannot be cancelled and the requested cache line is fetched to the L2 cache.  |

## 19.13 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON THE GOLDMONT PLUS MICROARCHITECTURE

Intel Atom processors based on the Goldmont Plus microarchitecture support the architectural performance monitoring events listed in Table 19-1 and fixed-function performance events using a fixed counter. They also support the following performance monitoring events listed in Table 19-27. These events apply to processors with CPUID signature of 06\_7AH. In addition, processors based on the Goldmont Plus microarchitecture also support the events listed in Table 19-27 (see Section 19.14, “Performance Monitoring Events for Processors Based on the Goldmont Microarchitecture”). For an event listed in Table 19-27 that also appears in the model-specific tables of prior generations, Table 19-27 supersedes prior generation tables.

Performance monitoring event descriptions may refer to terminology described in Section B.2, “Intel® Xeon® processor 5500 Series,” in Appendix B of the *Intel® 64 and IA-32 Architectures Optimization Reference Manual*.

In Goldmont Plus microarchitecture, performance monitoring events that support Processor Event Based Sampling (PEBS) and PEBS records that contain processor state information that are associated with at-retirement tagging are marked by “Precise Event”.

**Table 19-26. Performance Events for the Goldmont Plus Microarchitecture**

| Event Num. | Umask Value | Event Name                             | Description  | Comment                                      |
|------------|-------------|--|--|--|
| 00H        | 01H         | INST_RETIRED.ANY                       | Counts the number of instructions that retire execution. For instructions that consist of multiple uops, this event counts the retirement of the last uop of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers. This event uses fixed counter 0. You cannot collect a PEBS record for this event. | Fixed Event, Precise Event, Not Reduced Skid |
| 08H        | 02H         | DTLB_LOAD_MISSES.WALK_COMPLETED_4K     | Counts page walks completed due to demand data loads (including SW prefetches) whose address translations missed in all TLB levels and were mapped to 4K pages. The page walks can end with or without a page fault.   |  |
| 08H        | 04H         | DTLB_LOAD_MISSES.WALK_COMPLETED_2M_4M  | Counts page walks completed due to demand data loads (including SW prefetches) whose address translations missed in all TLB levels and were mapped to 2M or 4M pages. The page walks can end with or without a page fault.   |  |
| 08H        | 08H         | DTLB_LOAD_MISSES.WALK_COMPLETED_1GB    | Counts page walks completed due to demand data loads (including SW prefetches) whose address translations missed in all TLB levels and were mapped to 1GB pages. The page walks can end with or without a page fault.  |  |
| 08H        | 10H         | DTLB_LOAD_MISSES.WALK_PENDING          | Counts once per cycle for each page walk occurring due to a load (demand data loads or SW prefetches). Includes cycles spent traversing the Extended Page Table (EPT). Average cycles per walk can be calculated by dividing by the number of walks.   |  |
| 49H        | 02H         | DTLB_STORE_MISSES.WALK_COMPLETED_4K    | Counts page walks completed due to demand data stores whose address translations missed in the TLB and were mapped to 4K pages. The page walks can end with or without a page fault.   |  |
| 49H        | 04H         | DTLB_STORE_MISSES.WALK_COMPLETED_2M_4M | Counts page walks completed due to demand data stores whose address translations missed in the TLB and were mapped to 2M or 4M pages. The page walks can end with or without a page fault.   |  |
| 49H        | 08H         | DTLB_STORE_MISSES.WALK_COMPLETED_1GB   | Counts page walks completed due to demand data stores whose address translations missed in the TLB and were mapped to 1GB pages. The page walks can end with or without a page fault.  |  |
| 49H        | 10H         | DTLB_STORE_MISSES.WALK_PENDING         | Counts once per cycle for each page walk occurring due to a demand data store. Includes cycles spent traversing the Extended Page Table (EPT). Average cycles per walk can be calculated by dividing by the number of walks.   |  |

**Table 19-26. Performance Events for the Goldmont Plus Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Name                       | Description  | Comment |
|------------|-------------|----------------------------------|--|---------|
| 4FH        | 10H         | EPT.WALK_PENDING                 | Counts once per cycle for each page walk only while traversing the Extended Page Table (EPT), and does not count during the rest of the translation. The EPT is used for translating Guest-Physical Addresses to Physical Addresses for Virtual Machine Monitors (VMMs). Average cycles per walk can be calculated by dividing the count by number of walks. |         |
| 85H        | 02H         | ITLB_MISSES.WALK_COMPLETED_4K    | Counts page walks completed due to instruction fetches whose address translations missed in the TLB and were mapped to 4K pages. The page walks can end with or without a page fault.  |         |
| 85H        | 04H         | ITLB_MISSES.WALK_COMPLETED_2M_4M | Counts page walks completed due to instruction fetches whose address translations missed in the TLB and were mapped to 2M or 4M pages. The page walks can end with or without a page fault.  |         |
| 85H        | 08H         | ITLB_MISSES.WALK_COMPLETED_1GB   | Counts page walks completed due to instruction fetches whose address translations missed in the TLB and were mapped to 1GB pages. The page walks can end with or without a page fault.   |         |
| 85H        | 10H         | ITLB_MISSES.WALK_PENDING         | Counts once per cycle for each page walk occurring due to an instruction fetch. Includes cycles spent traversing the Extended Page Table (EPT). Average cycles per walk can be calculated by dividing by the number of walks.  |         |
| BDH        | 20H         | TLB_FLUSHES.STLB_ANY             | Counts STLB flushes. The TLBs are flushed on instructions like INVLPG and MOV to CR3.  |         |
| C3H        | 20H         | MACHINE_CLEARS.PAGE_FAULT        | Counts the number of times that the machines clears due to a page fault. Covers both I-side and D-side (Loads/Stores) page faults. A page fault occurs when either page is not present, or an access violation.  |         |

## 19.14 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON THE GOLDMONT MICROARCHITECTURE

Intel Atom processors based on the Goldmont microarchitecture support the architectural performance monitoring events listed in Table 19-1 and fixed-function performance events using a fixed counter. In addition, they also support the following model-specific performance monitoring events listed in Table 19-27. These events apply to processors with CPUID signatures of 06\_5CH, 06\_5FH, and 06\_7AH.

Performance monitoring event descriptions may refer to terminology described in Section B.2, “Intel® Xeon® processor 5500 Series,” in Appendix B of the *Intel® 64 and IA-32 Architectures Optimization Reference Manual*.

In Goldmont microarchitecture, performance monitoring events that support Processor Event Based Sampling (PEBS) and PEBS records that contain processor state information that are associated with at-retirement tagging are marked by “Precise Event”.

**Table 19-27. Performance Events for the Goldmont Microarchitecture**

| Event Num. | Umask Value | Event Name              | Description  | Comment       |
|------------|-------------|-------------------------|--|---------------|
| 03H        | 10H         | LD_BLOCKS.ALL_BLOCK     | Counts anytime a load that retires is blocked for any reason.  | Precise Event |
| 03H        | 08H         | LD_BLOCKS.UTLB_MISS     | Counts loads blocked because they are unable to find their physical address in the micro TLB (UTLB).   | Precise Event |
| 03H        | 02H         | LD_BLOCKS.STORE_FORWARD | Counts a load blocked from using a store forward because of an address/size mismatch; only one of the loads blocked from each store will be counted. | Precise Event |

**Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Name                        | Description   | Comment       |
|------------|-------------|-----------------------------------|---|---------------|
| 03H        | 01H         | LD_BLOCKS.DATA_UNKNOWN            | Counts a load blocked from using a store forward, but did not occur because the store data was not available at the right time. The forward might occur subsequently when the data is available.  | Precise Event |
| 03H        | 04H         | LD_BLOCKS.4K_ALIAS                | Counts loads that block because their address modulo 4K matches a pending store.  | Precise Event |
| 05H        | 01H         | PAGE_WALKS.D_SIDE_CYCLES          | Counts every core cycle when a Data-side (walks due to data operation) page walk is in progress.  |               |
| 05H        | 02H         | PAGE_WALKS.I_SIDE_CYCLES          | Counts every core cycle when an Instruction-side (walks due to an instruction fetch) page walk is in progress.  |               |
| 05H        | 03H         | PAGE_WALKS.CYCLES                 | Counts every core cycle a page-walk is in progress due to either a data memory operation, or an instruction fetch.  |               |
| 0EH        | 00H         | UOPS_ISSUED.ANY                   | Counts uops issued by the front end and allocated into the back end of the machine. This event counts uops that retire as well as uops that were speculatively executed but didn't retire. The sort of speculative uops that might be counted includes, but is not limited to those uops issued in the shadow of a mispredicted branch, those uops that are inserted during an assist (such as for a denormal floating-point result), and (previously allocated) uops that might be canceled during a machine clear.    |               |
| 13H        | 02H         | MISALIGN_MEM_REF.LOAD_PAGE_SPLIT  | Counts when a memory load of a uop that spans a page boundary (a split) is retired.   | Precise Event |
| 13H        | 04H         | MISALIGN_MEM_REF.STORE_PAGE_SPLIT | Counts when a memory store of a uop that spans a page boundary (a split) is retired.  | Precise Event |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFERENCE       | Counts memory requests originating from the core that reference a cache line in the L2 cache.   |               |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS            | Counts memory requests originating from the core that miss in the L2 cache.   |               |
| 30H        | 00H         | L2_REJECT_XQ.ALL                  | Counts the number of demand and prefetch transactions that the L2 XQ rejects due to a full or near full condition which likely indicates back pressure from the intra-die interconnect (IDI) fabric. The XQ may reject transactions from the L2Q (non-cacheable requests), L2 misses and L2 write-back victims.   |               |
| 31H        | 00H         | CORE_REJECT_L2Q.ALL               | Counts the number of demand and L1 prefetcher requests rejected by the L2Q due to a full or nearly full condition which likely indicates back pressure from L2Q. It also counts requests that would have gone directly to the XQ, but are rejected due to a full or nearly full condition, indicating back pressure from the IDI link. The L2Q may also reject transactions from a core to ensure fairness between cores, or to delay a core's dirty eviction when the address conflicts with incoming external snoops. |               |
| 3CH        | 00H         | CPU_CLK_UNHALTED.CORE_P           | Core cycles when core is not halted. This event uses a programmable general purpose performance counter.  |               |
| 3CH        | 01H         | CPU_CLK_UNHALTED.REF              | Reference cycles when core is not halted. This event uses a programmable general purpose performance counter.   |               |
| 51H        | 01H         | DL1.DIRTY_EVICTION                | Counts when a modified (dirty) cache line is evicted from the data L1 cache and needs to be written back to memory. No count will occur if the evicted line is clean, and hence does not require a writeback.   |               |

**Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Name                               | Description   | Comment |
|------------|-------------|--|---|---------|
| 80H        | 01H         | ICACHE.HIT                               | Counts requests to the Instruction Cache (ICache) for one or more bytes in an ICache Line and that cache line is in the Icache (hit). The event strives to count on a cache line basis, so that multiple accesses which hit in a single cache line count as one ICACHE.HIT. Specifically, the event counts when straight line code crosses the cache line boundary, or when a branch target is to a new line, and that cache line is in the ICache. This event counts differently than Intel processors based on the Silvermont microarchitecture.            |         |
| 80H        | 02H         | ICACHE.MISSES                            | Counts requests to the Instruction Cache (ICache) for one or more bytes in an ICache Line and that cache line is not in the Icache (miss). The event strives to count on a cache line basis, so that multiple accesses which miss in a single cache line count as one ICACHE.MISS. Specifically, the event counts when straight line code crosses the cache line boundary, or when a branch target is to a new line, and that cache line is not in the ICache. This event counts differently than Intel processors based on the Silvermont microarchitecture. |         |
| 80H        | 03H         | ICACHE.ACCESSSES                         | Counts requests to the Instruction Cache (ICache) for one or more bytes in an ICache Line. The event strives to count on a cache line basis, so that multiple fetches to a single cache line count as one ICACHE.ACCESS. Specifically, the event counts when accesses from straight line code crosses the cache line boundary, or when a branch target is to a new line. This event counts differently than Intel processors based on the Silvermont microarchitecture.   |         |
| 81H        | 04H         | ITLB.MISS                                | Counts the number of times the machine was unable to find a translation in the Instruction Translation Lookaside Buffer (ITLB) for a linear address of an instruction fetch. It counts when new translations are filled into the ITLB. The event is speculative in nature, but will not count translations (page walks) that are begun and not finished, or translations that are finished but not filled into the ITLB.  |         |
| 86H        | 00H         | FETCH_STALL.ALL                          | Counts cycles that fetch is stalled due to any reason. That is, the decoder queue is able to accept bytes, but the fetch unit is unable to provide bytes. This will include cycles due to an ITLB miss, ICache miss and other events.   |         |
| 86H        | 01H         | FETCH_STALL.ITLB_FILTER_PENDING_CYCLES   | Counts cycles that fetch is stalled due to an outstanding ITLB miss. That is, the decoder queue is able to accept bytes, but the fetch unit is unable to provide bytes due to an ITLB miss. Note: this event is not the same as page walk cycles to retrieve an instruction translation.  |         |
| 86H        | 02H         | FETCH_STALL.ICACHE_FILTER_PENDING_CYCLES | Counts cycles that an ICache miss is outstanding, and instruction fetch is stalled. That is, the decoder queue is able to accept bytes, but the fetch unit is unable to provide bytes, while an Icache miss is outstanding. Note this event is not the same as cycles to retrieve an instruction due to an Icache miss. Rather, it is the part of the Instruction Cache (ICache) miss time where no bytes are available for the decoder.  |         |

Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)

| Event Num. | Umask Value | Event Name             | Description  | Comment                         |
|------------|-------------|------------------------|--|---------------------------------|
| 9CH        | 00H         | UOPS_NOT_DELIVERED.ANY | <p>This event is used to measure front-end inefficiencies, i.e., when the front end of the machine is not delivering uops to the back end and the back end has not stalled. This event can be used to identify if the machine is truly front-end bound. When this event occurs, it is an indication that the front end of the machine is operating at less than its theoretical peak performance.</p> <p>Background: We can think of the processor pipeline as being divided into 2 broader parts: the front end and the back end. The front end is responsible for fetching the instruction, decoding into uops in machine understandable format and putting them into a uop queue to be consumed by the back end. The back end then takes these uops and allocates the required resources. When all resources are ready, uops are executed. If the back end is not ready to accept uops from the front end, then we do not want to count these as front-end bottlenecks. However, whenever we have bottlenecks in the back end, we will have allocation unit stalls and eventually force the front end to wait until the back end is ready to receive more uops. This event counts only when the back end is requesting more micro-uops and the front end is not able to provide them. When 3 uops are requested and no uops are delivered, the event counts 3. When 3 are requested, and only 1 is delivered, the event counts 2. When only 2 are delivered, the event counts 1. Alternatively stated, the event will not count if 3 uops are delivered, or if the back end is stalled and not requesting any uops at all. Counts indicate missed opportunities for the front end to deliver a uop to the back end. Some examples of conditions that cause front-end inefficiencies are: lcache misses, ITLB misses, and decoder restrictions that limit the front-end bandwidth.</p> <p>Known Issues: Some uops require multiple allocation slots. These uops will not be charged as a front end 'not delivered' opportunity, and will be regarded as a back-end problem. For example, the INC instruction has one uop that requires 2 issue slots. A stream of INC instructions will not count as UOPS_NOT_DELIVERED, even though only one instruction can be issued per clock. The low uop issue rate for a stream of INC instructions is considered to be a back-end issue.</p> |                                 |
| B7H        | 01H, 02H    | OFFCORE_RESPONSE       | Requires MSR_OFFCORE_RESP[0,1] to specify request type and response. (Duplicated for both MSRs.)   |                                 |
| COH        | 00H         | INST_RETIRED.ANY_P     | <p>Counts the number of instructions that retire execution. For instructions that consist of multiple uops, this event counts the retirement of the last uop of the instruction. The event continues counting during hardware interrupts, traps, and inside interrupt handlers. This is an architectural performance event. This event uses a programmable general purpose performance counter. *This event is a Precise Event: the EventingRIP field in the PEBS record is precise to the address of the instruction which caused the event.</p> <p>Note: Because PEBS records can be collected only on IA32_PMC0, only one event can use the PEBS facility at a time.</p>  | Precise Event                   |
| C2H        | 00H         | UOPS_RETIRED.ANY       | Counts uops which have retired.  | Precise Event, Not Reduced Skid |

**Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Name                         | Description   | Comment                         |
|------------|-------------|------------------------------------|---|---------------------------------|
| C2H        | 01H         | UOPS_RETIRED.MS                    | Counts uops retired that are from the complex flows issued by the micro-sequencer (MS). Counts both the uops from a micro-coded instruction, and the uops that might be generated from a micro-coded assist.  | Precise Event, Not Reduced Skid |
| C2H        | 08H         | UOPS_RETIRED.FPDIV                 | Counts the number of floating point divide uops retired.  | Precise Event                   |
| C2H        | 10H         | UOPS_RETIRED.IDIV                  | Counts the number of integer divide uops retired.   | Precise Event                   |
| C3H        | 01H         | MACHINE_CLEARS.SMC                 | Counts the number of times that the processor detects that a program is writing to a code section and has to perform a machine clear because of that modification. Self-modifying code (SMC) causes a severe penalty in all Intel architecture processors.                          |                                 |
| C3H        | 02H         | MACHINE_CLEARS.MEMORY_ORDERING     | Counts machine clears due to memory ordering issues. This occurs when a snoop request happens and the machine is uncertain if memory ordering will be preserved as another core is in the process of modifying the data.  |                                 |
| C3H        | 04H         | MACHINE_CLEARS.FP_ASSIST           | Counts machine clears due to floating-point (FP) operations needing assists. For instance, if the result was a floating-point denormal, the hardware clears the pipeline and reissues uops to produce the correct IEEE compliant denormal result.                                   |                                 |
| C3H        | 08H         | MACHINE_CLEARS.DISAMBIGUATION      | Counts machine clears due to memory disambiguation. Memory disambiguation happens when a load which has been issued conflicts with a previous un-retired store in the pipeline whose address was not known at issue time, but is later resolved to be the same as the load address. |                                 |
| C3H        | 00H         | MACHINE_CLEARS.ALL                 | Counts machine clears for any reason.   |                                 |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES       | Counts branch instructions retired for all branch types. This is an architectural performance event.  | Precise Event                   |
| C4H        | 7EH         | BR_INST_RETIRED.JCC                | Counts retired Jcc (Jump on Conditional Code/Jump if Condition is Met) branch instructions retired, including both when the branch was taken and when it was not taken.   | Precise Event                   |
| C4H        | 80H         | BR_INST_RETIRED.ALL_TAKEN_BRANCHES | Counts the number of taken branch instructions retired.   | Precise Event                   |
| C4H        | FEH         | BR_INST_RETIRED.TAKEN_JCC          | Counts Jcc (Jump on Conditional Code/Jump if Condition is Met) branch instructions retired that were taken and does not count when the Jcc branch instruction were not taken.   | Precise Event                   |
| C4H        | F9H         | BR_INST_RETIRED.CALL               | Counts near CALL branch instructions retired.   | Precise Event                   |
| C4H        | FDH         | BR_INST_RETIRED.REL_CALL           | Counts near relative CALL branch instructions retired.  | Precise Event                   |
| C4H        | FBH         | BR_INST_RETIRED.IND_CALL           | Counts near indirect CALL branch instructions retired.  | Precise Event                   |
| C4H        | F7H         | BR_INST_RETIRED.RETURN             | Counts near return branch instructions retired.   | Precise Event                   |
| C4H        | EBH         | BR_INST_RETIRED.NON_RETURN_IND     | Counts near indirect call or near indirect jmp branch instructions retired.   | Precise Event                   |
| C4H        | BFH         | BR_INST_RETIRED.FAR_BRANCH         | Counts far branch instructions retired. This includes far jump, far call and return, and Interrupt call and return.   | Precise Event                   |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANCHES       | Counts mispredicted branch instructions retired including all branch types.   | Precise Event                   |

**Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Name                             | Description  | Comment       |
|------------|-------------|--|--|---------------|
| C5H        | 7EH         | BR_MISP_RETIREDC.JCC                   | Counts mispredicted retired Jcc (Jump on Conditional Code/Jump if Condition is Met) branch instructions retired, including both when the branch was supposed to be taken and when it was not supposed to be taken (but the processor predicted the opposite condition).  | Precise Event |
| C5H        | FEH         | BR_MISP_RETIREDC.TAKEN_JCC             | Counts mispredicted retired Jcc (Jump on Conditional Code/Jump if Condition is Met) branch instructions retired that were supposed to be taken but the processor predicted that it would not be taken.   | Precise Event |
| C5H        | FBH         | BR_MISP_RETIREDC.INDIRECT_CALL         | Counts mispredicted near indirect CALL branch instructions retired, where the target address taken was not what the processor predicted.   | Precise Event |
| C5H        | F7H         | BR_MISP_RETIREDC.RETURN                | Counts mispredicted near RET branch instructions retired, where the return address taken was not what the processor predicted.   | Precise Event |
| C5H        | EBH         | BR_MISP_RETIREDC.NON_RETURN_INDIRECT   | Counts mispredicted branch instructions retired that were near indirect call or near indirect jmp, where the target address taken was not what the processor predicted.  | Precise Event |
| CAH        | 01H         | ISSUE_SLOTS_NOT_CONSUMED.RESOURCE_FULL | Counts the number of issue slots per core cycle that were not consumed because of a full resource in the back end. Including but not limited to resources include the Re-order Buffer (ROB), reservation stations (RS), load/store buffers, physical registers, or any other needed machine resource that is currently unavailable. Note that uops must be available for consumption in order for this event to fire. If a uop is not available (Instruction Queue is empty), this event will not count. |               |
| CAH        | 02H         | ISSUE_SLOTS_NOT_CONSUMED.RECOVERY      | Counts the number of issue slots per core cycle that were not consumed by the back end because allocation is stalled waiting for a mispredicted jump to retire or other branch-like conditions (e.g. the event is relevant during certain microcode flows). Counts all issue slots blocked while within this window, including slots where uops were not available in the Instruction Queue.   |               |
| CAH        | 00H         | ISSUE_SLOTS_NOT_CONSUMED.ANY           | Counts the number of issue slots per core cycle that were not consumed by the back end due to either a full resource in the back end (RESOURCE_FULL), or due to the processor recovering from some event (RECOVERY).   |               |
| CBH        | 01H         | HW_INTERRUPTS.RECEIVED                 | Counts hardware interrupts received by the processor.  |               |
| CBH        | 02H         | HW_INTERRUPTS.MASKED                   | Counts the number of core cycles during which interrupts are masked (disabled). Increments by 1 each core cycle that EFLAGS.IF is 0, regardless of whether interrupts are pending or not.  |               |
| CBH        | 04H         | HW_INTERRUPTS.PENDING_AND_MASKED       | Counts core cycles during which there are pending interrupts, but interrupts are masked (EFLAGS.IF = 0).   |               |
| CDH        | 00H         | CYCLES_DIV_BUSY.ALL                    | Counts core cycles if either divide unit is busy.  |               |
| CDH        | 01H         | CYCLES_DIV_BUSY.IDIV                   | Counts core cycles if the integer divide unit is busy.   |               |
| CDH        | 02H         | CYCLES_DIV_BUSY.FPDIV                  | Counts core cycles if the floating point divide unit is busy.  |               |
| D0H        | 81H         | MEM_UOPS_RETIREDC.ALL_LOADS            | Counts the number of load uops retired.  | Precise Event |
| D0H        | 82H         | MEM_UOPS_RETIREDC.ALL_STORES           | Counts the number of store uops retired.   | Precise Event |

**Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Name                        | Description   | Comment       |
|------------|-------------|-----------------------------------|---|---------------|
| DOH        | 83H         | MEM_UOPS_RETIRED.ALL              | Counts the number of memory uops retired that are either a load or a store or both.   | Precise Event |
| DOH        | 11H         | MEM_UOPS_RETIRED.DTLB_MISS_LOADS  | Counts load uops retired that caused a DTLB miss.   | Precise Event |
| DOH        | 12H         | MEM_UOPS_RETIRED.DTLB_MISS_STORES | Counts store uops retired that caused a DTLB miss.  | Precise Event |
| DOH        | 13H         | MEM_UOPS_RETIRED.DTLB_MISS        | Counts uops retired that had a DTLB miss on load, store or either.<br>Note that when two distinct memory operations to the same page miss the DTLB, only one of them will be recorded as a DTLB miss.   | Precise Event |
| DOH        | 21H         | MEM_UOPS_RETIRED.LOCK_LOADS       | Counts locked memory uops retired. This includes 'regular' locks and bus locks. To specifically count bus locks only, see the offcore response event. A locked access is one with a lock prefix, or an exchange to memory.  | Precise Event |
| DOH        | 41H         | MEM_UOPS_RETIRED.SPLIT_LOADS      | Counts load uops retired where the data requested spans a 64 byte cache line boundary.  | Precise Event |
| DOH        | 42H         | MEM_UOPS_RETIRED.SPLIT_STORES     | Counts store uops retired where the data requested spans a 64 byte cache line boundary.   | Precise Event |
| DOH        | 43H         | MEM_UOPS_RETIRED.SPLIT            | Counts memory uops retired where the data requested spans a 64 byte cache line boundary.  | Precise Event |
| D1H        | 01H         | MEM_LOAD_UOPS_RETIRED.L1_HIT      | Counts load uops retired that hit the L1 data cache.  | Precise Event |
| D1H        | 08H         | MEM_LOAD_UOPS_RETIRED.L1_MISS     | Counts load uops retired that miss the L1 data cache.   | Precise Event |
| D1H        | 02H         | MEM_LOAD_UOPS_RETIRED.L2_HIT      | Counts load uops retired that hit in the L2 cache.  | Precise Event |
| 0xD1H      | 10H         | MEM_LOAD_UOPS_RETIRED.L2_MISS     | Counts load uops retired that miss in the L2 cache.   | Precise Event |
| D1H        | 20H         | MEM_LOAD_UOPS_RETIRED.HITM        | Counts load uops retired where the cache line containing the data was in the modified state of another core or modules cache (HITM). More specifically, this means that when the load address was checked by other caching agents (typically another processor) in the system, one of those caching agents indicated that they had a dirty copy of the data. Loads that obtain a HITM response incur greater latency than most that is typical for a load. In addition, since HITM indicates that some other processor had this data in its cache, it implies that the data was shared between processors, or potentially was a lock or semaphore value. This event is useful for locating sharing, false sharing, and contended locks. | Precise Event |

**Table 19-27. Performance Events for the Goldmont Microarchitecture (Contd.)**

| Event Num. | Umask Value | Event Name                         | Description  | Comment       |
|------------|-------------|------------------------------------|--|---------------|
| D1H        | 40H         | MEM_LOAD_UOPS_RETIRED.WCB_HIT      | Counts memory load uops retired where the data is retrieved from the WCB (or fill buffer), indicating that the load found its data while that data was in the process of being brought into the L1 cache. Typically a load will receive this indication when some other load or prefetch missed the L1 cache and was in the process of retrieving the cache line containing the data, but that process had not yet finished (and written the data back to the cache). For example, consider load X and Y, both referencing the same cache line that is not in the L1 cache. If load X misses cache first, it obtains and WCB (or fill buffer) begins the process of requesting the data. When load Y requests the data, it will either hit the WCB, or the L1 cache, depending on exactly what time the request to Y occurs. | Precise Event |
| D1H        | 80H         | MEM_LOAD_UOPS_RETIRED.DRAM_HIT     | Counts memory load uops retired where the data is retrieved from DRAM. Event is counted at retirement, so the speculative loads are ignored. A memory load can hit (or miss) the L1 cache, hit (or miss) the L2 cache, hit DRAM, hit in the WCB or receive a HITM response.  | Precise Event |
| E6H        | 01H         | BACLEARS.ALL                       | Counts the number of times a BACLEAR is signaled for any reason, including, but not limited to indirect branch/call, Jcc (Jump on Conditional Code/Jump if Condition is Met) branch, unconditional branch/call, and returns.   |               |
| E6H        | 08H         | BACLEARS.RETURN                    | Counts BACLEARS on return instructions.  |               |
| E6H        | 10H         | BACLEARS.COND                      | Counts BACLEARS on Jcc (Jump on Conditional Code/Jump if Condition is Met) branches.   |               |
| E7H        | 01H         | MS_DECODED.MS_ENTRY                | Counts the number of times the Microcode Sequencer (MS) starts a flow of uops from the MSROM. It does not count every time a uop is read from the MSROM. The most common case that this counts is when a micro-coded instruction is encountered by the front end of the machine. Other cases include when an instruction encounters a fault, trap, or microcode assist of any sort that initiates a flow of uops. The event will count MS startups for uops that are speculative, and subsequently cleared by branch mispredict or a machine clear.  |               |
| E9H        | 01H         | DECODE_RESTRICTION.PREDECODE_WRONG | Counts the number of times the prediction (from the pre-decode cache) for instruction length is incorrect.   |               |

## 19.15 PERFORMANCE MONITORING EVENTS FOR PROCESSORS BASED ON THE SILVERMONT MICROARCHITECTURE

Processors based on the Silvermont microarchitecture support the architectural performance monitoring events listed in Table 19-1 and fixed-function performance events using fixed counter. In addition, they also support the following model-specific performance monitoring events listed in Table 19-28. These processors have the CPUID signatures of 06\_37H, 06\_4AH, 06\_4DH, 06\_5AH, and 06\_5DH.

Performance monitoring event descriptions may refer to terminology described in Section B.2, “Intel® Xeon® processor 5500 Series,” in Appendix B of the *Intel® 64 and IA-32 Architectures Optimization Reference Manual*.

**Table 19-28. Performance Events for Silvermont Microarchitecture**

| Event Num. | Umask Value | Event Name                       | Definition                                      | Description and Comment  |
|------------|-------------|----------------------------------|---|--|
| 03H        | 01H         | REHABQ.LD_BLOCK_ST_FORWARD       | Loads blocked due to store forward restriction. | This event counts the number of retired loads that were prohibited from receiving forwarded data from the store because of address mismatch.   |
| 03H        | 02H         | REHABQ.LD_BLOCK_STD_NOTREADY     | Loads blocked due to store data not ready.      | This event counts the cases where a forward was technically possible, but did not occur because the store data was not available at the right time.  |
| 03H        | 04H         | REHABQ.ST_SPLITS                 | Store uops that split cache line boundary.      | This event counts the number of retire stores that experienced cache line boundary splits.   |
| 03H        | 08H         | REHABQ.LD_SPLITS                 | Load uops that split cache line boundary.       | This event counts the number of retire loads that experienced cache line boundary splits.  |
| 03H        | 10H         | REHABQ.LOCK                      | Uops with lock semantics.                       | This event counts the number of retired memory operations with lock semantics. These are either implicit locked instructions such as the XCHG instruction or instructions with an explicit LOCK prefix (FOH).  |
| 03H        | 20H         | REHABQ.STA_FULL                  | Store address buffer full.                      | This event counts the number of retired stores that are delayed because there is not a store address buffer available.   |
| 03H        | 40H         | REHABQ.ANY_LD                    | Any reissued load uops.                         | This event counts the number of load uops reissued from Rehabq.  |
| 03H        | 80H         | REHABQ.ANY_ST                    | Any reissued store uops.                        | This event counts the number of store uops reissued from Rehabq.   |
| 04H        | 01H         | MEM_UOPS_RETIRED.L1_MISS_LOADS   | Loads retired that missed L1 data cache.        | This event counts the number of load ops retired that miss in L1 Data cache. Note that prefetch misses will not be counted.  |
| 04H        | 02H         | MEM_UOPS_RETIRED.L2_HIT_LOADS    | Loads retired that hit L2.                      | This event counts the number of load micro-ops retired that hit L2.  |
| 04H        | 04H         | MEM_UOPS_RETIRED.L2_MISS_LOADS   | Loads retired that missed L2.                   | This event counts the number of load micro-ops retired that missed L2.   |
| 04H        | 08H         | MEM_UOPS_RETIRED.DTLB_MISS_LOADS | Loads missed DTLB.                              | This event counts the number of load ops retired that had DTLB miss.   |
| 04H        | 10H         | MEM_UOPS_RETIRED.UTLB_MISS       | Loads missed UTLB.                              | This event counts the number of load ops retired that had UTLB miss.   |
| 04H        | 20H         | MEM_UOPS_RETIRED.HITM            | Cross core or cross module hitm.                | This event counts the number of load ops retired that got data from the other core or from the other module.   |
| 04H        | 40H         | MEM_UOPS_RETIRED.ALL_LOADS       | All Loads.                                      | This event counts the number of load ops retired.  |
| 04H        | 80H         | MEM_UOP_RETIRED.ALL_STORES       | All Stores.                                     | This event counts the number of store ops retired.   |
| 05H        | 01H         | PAGE_WALKS.D_SIDE_CYCLES         | Duration of D-side page-walks in core cycles.   | This event counts every cycle when a D-side (walks due to a load) page walk is in progress. Page walk duration divided by number of page walks is the average duration of page-walks. Edge trigger bit must be cleared. Set Edge to count the number of page walks.                |
| 05H        | 02H         | PAGE_WALKS.I_SIDE_CYCLES         | Duration of I-side page-walks in core cycles.   | This event counts every cycle when an I-side (walks due to an instruction fetch) page walk is in progress. Page walk duration divided by number of page walks is the average duration of page-walks. Edge trigger bit must be cleared. Set Edge to count the number of page walks. |

**Table 19-28. Performance Events for Silvermont Microarchitecture**

| Event Num. | Umask Value | Event Name                  | Definition  | Description and Comment   |
|------------|-------------|-----------------------------|---|---|
| 05H        | 03H         | PAGE_WALKS.WALKS            | Total number of page-walks that are completed (I-side and D-side).                        | This event counts when a data (D) page walk or an instruction (I) page walk is completed or started. Since a page walk implies a TLB miss, the number of TLB misses can be counted by counting the number of pagewalks.<br>Edge trigger bit must be set. Clear Edge to count the number of cycles.  |
| 2EH        | 41H         | LONGEST_LAT_CACHE.MISS      | L2 cache request misses.  | This event counts the total number of L2 cache references and the number of L2 cache misses respectively.<br>L3 is not supported in Silvermont microarchitecture.   |
| 2EH        | 4FH         | LONGEST_LAT_CACHE.REFERENCE | L2 cache requests from this core.   | This event counts requests originating from the core that references a cache line in the L2 cache.<br>L3 is not supported in Silvermont microarchitecture.  |
| 30H        | 00H         | L2_REJECT_XQ.ALL            | Counts the number of request from the L2 that were not accepted into the XQ.              | This event counts the number of demand and prefetch transactions that the L2 XQ rejects due to a full or near full condition which likely indicates back pressure from the IDI link. The XQ may reject transactions from the L2Q (non-cacheable requests), BBS (L2 misses) and WOB (L2 write-back victims).   |
| 31H        | 00H         | CORE_REJECT_L2Q.ALL         | Counts the number of request that were not accepted into the L2Q because the L2Q is FULL. | This event counts the number of demand and L1 prefetcher requests rejected by the L2Q due to a full or nearly full condition which likely indicates back pressure from L2Q. It also counts requests that would have gone directly to the XQ, but are rejected due to a full or nearly full condition, indicating back pressure from the IDI link. The L2Q may also reject transactions from a core to insure fairness between cores, or to delay a core's dirty eviction when the address conflicts incoming external snoops. (Note that L2 prefetcher requests that are dropped are not counted by this event.). |
| 3CH        | 00H         | CPU_CLK_UNHALTED.CORE_P     | Core cycles when core is not halted.  | This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. In mobile systems the core frequency may change from time to time. For this reason this event may have a changing ratio with regards to time.   |
| N/A        | N/A         | CPU_CLK_UNHALTED.CORE       | Core cycles when core is not halted.  | This uses the fixed counter 1 to count the same condition as CPU_CLK_UNHALTED.CORE_P does.  |
| 3CH        | 01H         | CPU_CLK_UNHALTED.REF_P      | Bus cycles when core is not halted.   | This event counts the number of bus cycles that the core is not in a halt state. The core enters the halt state when it is running the HLT instruction.<br>In mobile systems the core frequency may change from time. This event is not affected by core frequency changes.   |
| N/A        | N/A         | CPU_CLK_UNHALTED.REF_TSC    | Reference cycles when core is not halted.   | This event counts the number of reference cycles at a TSC rate that the core is not in a halt state. The core enters the halt state when it is running the HLT instruction.<br>In mobile systems the core frequency may change from time. This event is not affected by core frequency changes.   |
| 80H        | 01H         | ICACHE.HIT                  | Instruction fetches from Icache.  | This event counts all instruction fetches from the instruction cache.   |
| 80H        | 02H         | ICACHE.MISSES               | Icache miss.  | This event counts all instruction fetches that miss the Instruction cache or produce memory requests. This includes uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.   |

Table 19-28. Performance Events for Silvermont Microarchitecture

| Event Num. | Umask Value | Event Name                      | Definition   | Description and Comment   |
|------------|-------------|---------------------------------|--|---|
| 80H        | 03H         | ICACHE.ACCESES                  | Instruction fetches.                                     | This event counts all instruction fetches, including uncacheable fetches.   |
| B7H        | 01H         | OFFCORE_RESPONSE_0              | See Section 18.5.2.2.                                    | Requires MSR_OFFCORE_RESP0 to specify request type and response.  |
| B7H        | 02H         | OFFCORE_RESPONSE_1              | See Section 18.5.2.2.                                    | Requires MSR_OFFCORE_RESP1 to specify request type and response.  |
| C0H        | 00H         | INST_RETIRED.ANY_P              | Instructions retired (PEBS supported with IA32_PMC0).    | This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers. |
| N/A        | N/A         | INST_RETIRED.ANY                | Instructions retired.                                    | This uses the fixed counter 0 to count the same condition as INST_RETIRED.ANY_P does.   |
| C2H        | 01H         | UOPS_RETIRED.MS                 | MSROM micro-ops retired.                                 | This event counts the number of micro-ops retired that were supplied from MSROM.  |
| C2H        | 10H         | UOPS_RETIRED.ALL                | Micro-ops retired.                                       | This event counts the number of micro-ops retired.  |
| C3H        | 01H         | MACHINE_CLEARS.SMC              | Self-Modifying Code detected.                            | This event counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel® architecture processors.   |
| C3H        | 02H         | MACHINE_CLEARS.MEMORY_ORDERING  | Stalls due to Memory ordering.                           | This event counts the number of times that pipeline was cleared due to memory ordering issues.  |
| C3H        | 04H         | MACHINE_CLEARS.FP_ASSIST        | Stalls due to FP assists.                                | This event counts the number of times that pipeline stalled due to FP operations needing assists.   |
| C3H        | 08H         | MACHINE_CLEARS.ALL              | Stalls due to any causes.                                | This event counts the number of times that pipeline stalled due to due to any causes (including SMC, MO, FP assist, etc.).  |
| C4H        | 00H         | BR_INST_RETIRED.ALL_BRANCHES    | Retired branch instructions.                             | This event counts the number of branch instructions retired.  |
| C4H        | 7EH         | BR_INST_RETIRED.JCC             | Retired branch instructions that were conditional jumps. | This event counts the number of branch instructions retired that were conditional jumps.  |
| C4H        | BFH         | BR_INST_RETIRED.FAR_BRANCH      | Retired far branch instructions.                         | This event counts the number of far branch instructions retired.  |
| C4H        | EBH         | BR_INST_RETIRED.NO_N_RETURN_IND | Retired instructions of near indirect jmp or call.       | This event counts the number of branch instructions retired that were near indirect call or near indirect jmp.  |
| C4H        | F7H         | BR_INST_RETIRED.RETURN          | Retired near return instructions.                        | This event counts the number of near RET branch instructions retired.   |
| C4H        | F9H         | BR_INST_RETIRED.CALL            | Retired near call instructions.                          | This event counts the number of near CALL branch instructions retired.  |
| C4H        | FBH         | BR_INST_RETIRED.IND_CALL        | Retired near indirect call instructions.                 | This event counts the number of near indirect CALL branch instructions retired.   |
| C4H        | FDH         | BR_INST_RETIRED.REL_CALL        | Retired near relative call instructions.                 | This event counts the number of near relative CALL branch instructions retired.   |
| C4H        | FEH         | BR_INST_RETIRED.TAKEN_JCC       | Retired conditional jumps that were taken.               | This event counts the number of branch instructions retired that were conditional jumps and taken.  |
| C5H        | 00H         | BR_MISP_RETIRED.ALL_BRANCHES    | Retired mispredicted branch instructions.                | This event counts the number of mispredicted branch instructions retired.   |

**Table 19-28. Performance Events for Silvermont Microarchitecture**

| Event Num. | Umask Value | Event Name                     | Definition  | Description and Comment  |
|------------|-------------|--------------------------------|---|--|
| C5H        | 7EH         | BR_MISP_RETIRED.JCC            | Retired mispredicted conditional jumps.   | This event counts the number of mispredicted branch instructions retired that were conditional jumps.  |
| C5H        | BFH         | BR_MISP_RETIRED.FAR            | Retired mispredicted far branch instructions.   | This event counts the number of mispredicted far branch instructions retired.  |
| C5H        | EBH         | BR_MISP_RETIRED.NON_RETURN_IND | Retired mispredicted instructions of near indirect jmp or call.   | This event counts the number of mispredicted branch instructions retired that were near indirect call or near indirect jmp.                  |
| C5H        | F7H         | BR_MISP_RETIRED.RETURN         | Retired mispredicted near return instructions.  | This event counts the number of mispredicted near RET branch instructions retired.   |
| C5H        | F9H         | BR_MISP_RETIRED.CALL           | Retired mispredicted near call instructions.  | This event counts the number of mispredicted near CALL branch instructions retired.  |
| C5H        | FBH         | BR_MISP_RETIRED.IND_CALL       | Retired mispredicted near indirect call instructions.   | This event counts the number of mispredicted near indirect CALL branch instructions retired.   |
| C5H        | FDH         | BR_MISP_RETIRED.REL_CALL       | Retired mispredicted near relative call instructions  | This event counts the number of mispredicted near relative CALL branch instructions retired.   |
| C5H        | FEH         | BR_MISP_RETIRED.TAKEN_JCC      | Retired mispredicted conditional jumps that were taken.   | This event counts the number of mispredicted branch instructions retired that were conditional jumps and taken.                              |
| CAH        | 01H         | NO_ALLOC_CYCLES.ROB_FULL       | Counts the number of cycles when no uops are allocated and the ROB is full (less than 2 entries available). | Counts the number of cycles when no uops are allocated and the ROB is full (less than 2 entries available).                                  |
| CAH        | 20H         | NO_ALLOC_CYCLES.RAT_STALL      | Counts the number of cycles when no uops are allocated and a RATstall is asserted.                          | Counts the number of cycles when no uops are allocated and a RATstall is asserted.   |
| CAH        | 3FH         | NO_ALLOC_CYCLES.AL             | Front end not delivering.   | This event counts the number of cycles when the front end does not provide any instructions to be allocated for any reason.                  |
| CAH        | 50H         | NO_ALLOC_CYCLES.NOT_DELIVERED  | Front end not delivering back end not stalled.  | This event counts the number of cycles when the front end does not provide any instructions to be allocated but the back end is not stalled. |
| CBH        | 01H         | RS_FULL_STALL.MEC              | MEC RS full.  | This event counts the number of cycles the allocation pipe line stalled due to the RS for the MEC cluster is full.                           |
| CBH        | 1FH         | RS_FULL_STALL.ALL              | Any RS full.  | This event counts the number of cycles that the allocation pipe line stalled due to any one of the RS is full.                               |
| CDH        | 01H         | CYCLES_DIV_BUSY.ANY            | Divider Busy.   | This event counts the number of cycles the divider is busy.  |
| E6H        | 01H         | BACLEARS.ALL                   | BACLEARS asserted for any branch.   | This event counts the number of baclears for any type of branch.   |
| E6H        | 08H         | BACLEARS.RETURN                | BACLEARS asserted for return branch.  | This event counts the number of baclears for return branches.  |

**Table 19-28. Performance Events for Silvermont Microarchitecture**

| Event Num. | Umask Value | Event Name          | Definition                                | Description and Comment  |
|------------|-------------|---------------------|---|--|
| E6H        | 10H         | BACLEARS.COND       | BACLEARS asserted for conditional branch. | This event counts the number of baclears for conditional branches.     |
| E7H        | 01H         | MS_DECODED.MS_ENTRY | MS Decode starts.                         | This event counts the number of times the MSROM starts a flow of UOPS. |

### 19.15.1 Performance Monitoring Events for Processors Based on the Airmont Microarchitecture

Intel processors based on the Airmont microarchitecture support the same architectural and the model-specific performance monitoring events as processors based on the Silvermont microarchitecture. All of the events listed in Table 19-28 apply. These processors have the CPUID signatures that include 06\_4CH.

## 19.16 PERFORMANCE MONITORING EVENTS FOR 45 NM AND 32 NM INTEL® ATOM™ PROCESSORS

45 nm and 32 nm processors based on the Intel® Atom™ microarchitecture support the architectural performance monitoring events listed in Table 19-1 and fixed-function performance events using fixed counter listed in Table 19-24. In addition, they also support the following model-specific performance monitoring events listed in Table 19-29.

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors**

| Event Num. | Umask Value | Event Name                | Definition   | Description and Comment   |
|------------|-------------|---------------------------|--|---|
| 02H        | 81H         | STORe_FORWARDS.GO<br>OD   | Good store forwards.   | This event counts the number of times store data was forwarded directly to a load.  |
| 06H        | 00H         | SEGMENT_REG_<br>LOADS.ANY | Number of segment register loads.  | This event counts the number of segment register load operations. Instructions that load new values into segment registers cause a penalty. This event indicates performance issues in 16-bit code. If this event occurs frequently, it may be useful to calculate the number of instructions retired per segment register load. If the resulting calculation is low (on average a small number of instructions are executed between segment register loads), then the code's segment register usage should be optimized.<br><br>As a result of branch misprediction, this event is speculative and may include segment register loads that do not actually occur. However, most segment register loads are internally serialized and such speculative effects are minimized. |
| 07H        | 01H         | PREFETCH.PREFETCH<br>T0   | Streaming SIMD Extensions (SSE) PrefetchT0 instructions executed.                | This event counts the number of times the SSE instruction prefetchT0 is executed. This instruction prefetches the data to the L1 data cache and L2 cache.   |
| 07H        | 06H         | PREFETCH.SW_L2            | Streaming SIMD Extensions (SSE) PrefetchT1 and PrefetchT2 instructions executed. | This event counts the number of times the SSE instructions prefetchT1 and prefetchT2 are executed. These instructions prefetch the data to the L2 cache.  |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value | Event Name                      | Definition  | Description and Comment   |
|------------|-------------|---------------------------------|---|---|
| 07H        | 08H         | PREFETCH.PREFETCHNTA            | Streaming SIMD Extensions (SSE) Prefetch NTA instructions executed. | This event counts the number of times the SSE instruction prefetchNTA is executed. This instruction prefetches the data to the L1 data cache.   |
| 08H        | 07H         | DATA_TLB_MISSES.DTLB_MISS       | Memory accesses that missed the DTLB.                               | This event counts the number of Data Table Lookaside Buffer (DTLB) misses. The count includes misses detected as a result of speculative accesses. Typically a high count for this event indicates that the code accesses a large number of data pages.   |
| 08H        | 05H         | DATA_TLB_MISSES.DTLB_MISS_LD    | DTLB misses due to load operations.                                 | This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to load operations. This count includes misses detected as a result of speculative accesses.  |
| 08H        | 09H         | DATA_TLB_MISSES.LO_DTLB_MISS_LD | LO_DTLB misses due to load operations.                              | This event counts the number of LO_DTLB misses due to load operations. This count includes misses detected as a result of speculative accesses.   |
| 08H        | 06H         | DATA_TLB_MISSES.DTLB_MISS_ST    | DTLB misses due to store operations.                                | This event counts the number of Data Table Lookaside Buffer (DTLB) misses due to store operations. This count includes misses detected as a result of speculative accesses.   |
| 0CH        | 03H         | PAGE_WALKS.WALKS                | Number of page-walks executed.                                      | This event counts the number of page-walks executed due to either a DTLB or ITLB miss. The page walk duration, PAGE_WALKS.CYCLES, divided by number of page walks is the average duration of a page walk. This can hint to whether most of the page-walks are satisfied by the caches or cause an L2 cache miss.<br>Edge trigger bit must be set.                       |
| 0CH        | 03H         | PAGE_WALKS.CYCLES               | Duration of page-walks in core cycles.                              | This event counts the duration of page-walks in core cycles. The paging mode in use typically affects the duration of page walks. Page walk duration divided by number of page walks is the average duration of page-walks. This can hint at whether most of the page-walks are satisfied by the caches or cause an L2 cache miss.<br>Edge trigger bit must be cleared. |
| 10H        | 01H         | X87_COMP_OPS_EXE.ANY.S          | Floating point computational micro-ops executed.                    | This event counts the number of x87 floating point computational micro-ops executed.  |
| 10H        | 81H         | X87_COMP_OPS_EXE.ANY.AR         | Floating point computational micro-ops retired.                     | This event counts the number of x87 floating point computational micro-ops retired.   |
| 11H        | 01H         | FP_ASSIST                       | Floating point assists.   | This event counts the number of floating point operations executed that required micro-code assist intervention. These assists are required in the following cases.<br>X87 instructions:<br>1. NaN or denormal are loaded to a register or used as input from memory.<br>2. Division by 0.<br>3. Underflow output.  |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value                     | Event Name      | Definition                            | Description and Comment  |
|------------|---------------------------------|-----------------|---------------------------------------|--|
| 11H        | 81H                             | FP_ASSIST.AR    | Floating point assists.               | This event counts the number of floating point operations executed that required micro-code assist intervention. These assists are required in the following cases.<br>X87 instructions:<br>1. NaN or denormal are loaded to a register or used as input from memory.<br>2. Division by 0.<br>3. Underflow output.   |
| 12H        | 01H                             | MUL.S           | Multiply operations executed.         | This event counts the number of multiply operations executed. This includes integer as well as floating point multiply operations.   |
| 12H        | 81H                             | MUL.AR          | Multiply operations retired.          | This event counts the number of multiply operations retired. This includes integer as well as floating point multiply operations.  |
| 13H        | 01H                             | DIV.S           | Divide operations executed.           | This event counts the number of divide operations executed. This includes integer divides, floating point divides and square-root operations executed.   |
| 13H        | 81H                             | DIV.AR          | Divide operations retired.            | This event counts the number of divide operations retired. This includes integer divides, floating point divides and square-root operations executed.  |
| 14H        | 01H                             | CYCLES_DIV_BUSY | Cycles the divider is busy.           | This event counts the number of cycles the divider is busy executing divide or square root operations. The divide can be integer, X87 or Streaming SIMD Extensions (SSE). The square root operation can be either X87 or SSE.  |
| 21H        | See Table 18-61                 | L2_ADS          | Cycles L2 address bus is in use.      | This event counts the number of cycles the L2 address bus is being used for accesses to the L2 cache or bus queue.<br>This event can count occurrences for this core or both cores.  |
| 22H        | See Table 18-61                 | L2_DBUS_BUSY    | Cycles the L2 cache data bus is busy. | This event counts core cycles during which the L2 cache data bus is busy transferring data from the L2 cache to the core. It counts for all L1 cache misses (data and instruction) that hit the L2 cache. The count will increment by two for a full cache-line request.   |
| 24H        | See Table 18-61 and Table 18-63 | L2_LINES_IN     | L2 cache misses.                      | This event counts the number of cache lines allocated in the L2 cache. Cache lines are allocated in the L2 cache as a result of requests from the L1 data and instruction caches and the L2 hardware prefetchers to cache lines that are missing in the L2 cache.<br><br>This event can count occurrences for this core or both cores. This event can also count demand requests and L2 hardware prefetch requests together or separately. |
| 25H        | See Table 18-61                 | L2_M_LINES_IN   | L2 cache line modifications.          | This event counts whenever a modified cache line is written back from the L1 data cache to the L2 cache.<br><br>This event can count occurrences for this core or both cores.  |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Unmask Value                                 | Event Name     | Definition                                | Description and Comment  |
|------------|--|----------------|---|--|
| 26H        | See Table 18-61 and Table 18-63              | L2_LINES_OUT   | L2 cache lines evicted.                   | This event counts the number of L2 cache lines evicted.<br><br>This event can count occurrences for this core or both cores.<br>This event can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.   |
| 27H        | See Table 18-61 and Table 18-63              | L2_M_LINES_OUT | Modified lines evicted from the L2 cache. | This event counts the number of L2 modified cache lines evicted. These lines are written back to memory unless they also exist in a shared-state in one of the L1 data caches.<br><br>This event can count occurrences for this core or both cores.<br>This event can also count evictions due to demand requests and L2 hardware prefetch requests together or separately.  |
| 28H        | See Table 18-61 and Table 18-64              | L2_IFETCH      | L2 cacheable instruction fetch requests.  | This event counts the number of instruction cache line requests from the ICache. It does not include fetch requests from uncacheable memory. It does not include ITLB miss accesses.<br><br>This event can count occurrences for this core or both cores.<br>This event can also count accesses to cache lines at different MESI states.   |
| 29H        | See Table 18-61, Table 18-63 and Table 18-64 | L2_LD          | L2 cache reads.                           | This event counts L2 cache read requests coming from the L1 data cache and L2 prefetchers.<br><br>This event can count occurrences for this core or both cores.<br>This event can count occurrences<br>- for this core or both cores.<br>- due to demand requests and L2 hardware prefetch requests together or separately.<br>- of accesses to cache lines at different MESI states.  |
| 2AH        | See Table 18-61 and Table 18-64              | L2_ST          | L2 store requests.                        | This event counts all store operations that miss the L1 data cache and request the data from the L2 cache.<br><br>This event can count occurrences for this core or both cores.<br>This event can also count accesses to cache lines at different MESI states.   |
| 2BH        | See Table 18-61 and Table 18-64              | L2_LOCK        | L2 locked accesses.                       | This event counts all locked accesses to cache lines that miss the L1 data cache.<br><br>This event can count occurrences for this core or both cores.<br>This event can also count accesses to cache lines at different MESI states.  |
| 2EH        | See Table 18-61, Table 18-63 and Table 18-64 | L2_RQSTS       | L2 cache requests.                        | This event counts all completed L2 cache requests. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, instruction fetches, and all L2 hardware prefetch requests.<br><br>This event can count occurrences<br>- for this core or both cores.<br>- due to demand requests and L2 hardware prefetch requests together, or separately.<br>- of accesses to cache lines at different MESI states. |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value                                  | Event Name                   | Definition   | Description and Comment  |
|------------|--|------------------------------|--|--|
| 2EH        | 41H  | L2_RQSTS.SELF.DEMAND.I_STATE | L2 cache demand requests from this core that missed the L2.          | This event counts all completed L2 cache demand requests from this core that miss the L2 cache. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches.<br>This is an architectural performance event.   |
| 2EH        | 4FH  | L2_RQSTS.SELF.DEMAND.MESI    | L2 cache demand requests from this core.                             | This event counts all completed L2 cache demand requests from this core. This includes L1 data cache reads, writes, and locked accesses, L1 data prefetch requests, and instruction fetches.<br>This is an architectural performance event.  |
| 30H        | See Table 18-61, Table 18-63 and Table 18-64 | L2_REJECT_BUSQ               | Rejected L2 cache requests.  | This event indicates that a pending L2 cache request that requires a bus transaction is delayed from moving to the bus queue. Some of the reasons for this event are:<br>- The bus queue is full.<br>- The bus queue already holds an entry for a cache line in the same set.<br>The number of events is greater or equal to the number of requests that were rejected.<br>- For this core or both cores.<br>- Due to demand requests and L2 hardware prefetch requests together, or separately.<br>- Of accesses to cache lines at different MESI states.   |
| 32H        | See Table 18-61                              | L2_NO_REQ                    | Cycles no L2 cache requests are pending.                             | This event counts the number of cycles that no L2 cache requests are pending.  |
| 3AH        | 00H  | EIST_TRANS                   | Number of Enhanced Intel SpeedStep(R) Technology (EIST) transitions. | This event counts the number of Enhanced Intel SpeedStep(R) Technology (EIST) transitions that include a frequency change, either with or without VID change. This event is incremented only while the counting core is in C0 state. In situations where an EIST transition was caused by hardware as a result of CxE state transitions, those EIST transitions will also be registered in this event.<br><br>Enhanced Intel Speedstep Technology transitions are commonly initiated by OS, but can be initiated by HW internally. For example: CxE states are C-states (C1,C2,C3...) which not only place the CPU into a sleep state by turning off the clock and other components, but also lower the voltage (which reduces the leakage power consumption). The same is true for thermal throttling transition which uses Enhanced Intel Speedstep Technology internally. |
| 3BH        | COH  | THERMAL_TRIP                 | Number of thermal trips.   | This event counts the number of thermal trips. A thermal trip occurs whenever the processor temperature exceeds the thermal trip threshold temperature. Following a thermal trip, the processor automatically reduces frequency and voltage. The processor checks the temperature every millisecond, and returns to normal when the temperature falls below the thermal trip threshold temperature.  |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value                      | Event Name                | Definition  | Description and Comment   |
|------------|----------------------------------|---------------------------|---|---|
| 3CH        | 00H                              | CPU_CLK_UNHALTED.CORE_P   | Core cycles when core is not halted.                    | <p>This event counts the number of core cycles while the core is not in a halt state. The core enters the halt state when it is running the HLT instruction. This event is a component in many key event ratios.</p> <p>In mobile systems the core frequency may change from time to time. For this reason this event may have a changing ratio with regards to time. In systems with a constant core frequency, this event can give you a measurement of the elapsed time while the core was not in halt state by dividing the event count by the core frequency.</p> <ul style="list-style-type: none"> <li>-This is an architectural performance event.</li> <li>- The event CPU_CLK_UNHALTED.CORE_P is counted by a programmable counter.</li> <li>- The event CPU_CLK_UNHALTED.CORE is counted by a designated fixed counter, leaving the two programmable counters available for other events.</li> </ul> |
| 3CH        | 01H                              | CPU_CLK_UNHALTED.BUS      | Bus cycles when core is not halted.                     | <p>This event counts the number of bus cycles while the core is not in the halt state. This event can give you a measurement of the elapsed time while the core was not in the halt state, by dividing the event count by the bus frequency. The core enters the halt state when it is running the HLT instruction.</p> <p>The event also has a constant ratio with CPU_CLK_UNHALTED.REF event, which is the maximum bus to processor frequency ratio.</p> <p>Non-halted bus cycles are a component in many key event ratios.</p>   |
| 3CH        | 02H                              | CPU_CLK_UNHALTED.NO_OTHER | Bus cycles when core is active and the other is halted. | <p>This event counts the number of bus cycles during which the core remains non-halted, and the other core on the processor is halted.</p> <p>This event can be used to determine the amount of parallelism exploited by an application or a system. Divide this event count by the bus frequency to determine the amount of time that only one core was in use.</p>  |
| 40H        | 21H                              | L1D_CACHE.LD              | L1 Cacheable Data Reads.                                | This event counts the number of data reads from cacheable memory.   |
| 40H        | 22H                              | L1D_CACHE.ST              | L1 Cacheable Data Writes.                               | This event counts the number of data writes to cacheable memory.  |
| 60H        | See Table 18-61 and Table 18-62. | BUS_REQUEST_OUTSTANDING   | Outstanding cacheable data read bus requests duration.  | This event counts the number of pending full cache line read transactions on the bus occurring in each cycle. A read transaction is pending from the cycle it is sent on the bus until the full cache line is received by the processor. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.   |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value                      | Event Name      | Definition                                 | Description and Comment  |
|------------|----------------------------------|-----------------|--|--|
| 61H        | See Table 18-62.                 | BUS_BNR_DRV     | Number of Bus Not Ready signals asserted.  | <p>This event counts the number of Bus Not Ready (BNR) signals that the processor asserts on the bus to suspend additional bus requests by other bus agents. A bus agent asserts the BNR signal when the number of data and snoop transactions is close to the maximum that the bus can handle.</p> <p>While this signal is asserted, new transactions cannot be submitted on the bus. As a result, transaction latency may have higher impact on program performance. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.</p>      |
| 62H        | See Table 18-62.                 | BUS_DRDY_CLOCKS | Bus cycles when data is sent on the bus.   | <p>This event counts the number of bus cycles during which the DRDY (Data Ready) signal is asserted on the bus. The DRDY signal is asserted when data is sent on the bus.</p> <p>This event counts the number of bus cycles during which this agent (the processor) writes data on the bus back to memory or to other bus agents. This includes all explicit and implicit data writebacks, as well as partial writes.</p> <p>Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.</p>  |
| 63H        | See Table 18-61 and Table 18-62. | BUS_LOCK_CLOCKS | Bus cycles when a LOCK signal is asserted. | <p>This event counts the number of bus cycles, during which the LOCK signal is asserted on the bus. A LOCK signal is asserted when there is a locked memory access, due to:</p> <ul style="list-style-type: none"> <li>- Uncacheable memory.</li> <li>- Locked operation that spans two cache lines.</li> <li>- Page-walk from an uncacheable page table.</li> </ul> <p>Bus locks have a very high performance penalty and it is highly recommended to avoid such accesses. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.</p> |
| 64H        | See Table 18-61.                 | BUS_DATA_RCV    | Bus cycles while processor receives data.  | This event counts the number of cycles during which the processor is busy receiving data. NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.   |
| 65H        | See Table 18-61 and Table 18-62. | BUS_TRANS_BRD   | Burst read bus transactions.               | <p>This event counts the number of burst read transactions including:</p> <ul style="list-style-type: none"> <li>- L1 data cache read misses (and L1 data cache hardware prefetches).</li> <li>- L2 hardware prefetches by the DPL and L2 streamer.</li> <li>- IFU read misses of cacheable lines.</li> </ul> <p>It does not include RFO transactions.</p>   |
| 66H        | See Table 18-61 and Table 18-62. | BUS_TRANS_RFO   | RFO bus transactions.                      | This event counts the number of Read For Ownership (RFO) bus transactions, due to store operations that miss the L1 data cache and the L2 cache. This event also counts RFO bus transactions due to locked operations.   |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value                      | Event Name        | Definition                                | Description and Comment  |
|------------|----------------------------------|-------------------|---|--|
| 67H        | See Table 18-61 and Table 18-62. | BUS_TRANS_WB      | Explicit writeback bus transactions.      | This event counts all explicit writeback bus transactions due to dirty line evictions. It does not count implicit writebacks due to invalidation by a snoop request.   |
| 68H        | See Table 18-61 and Table 18-62. | BUS_TRANS_IFETCH  | Instruction-fetch bus transactions.       | This event counts all instruction fetch full cache line bus transactions.  |
| 69H        | See Table 18-61 and Table 18-62. | BUS_TRANS_INVALID | Invalidate bus transactions.              | This event counts all invalidate transactions. Invalidate transactions are generated when: <ul style="list-style-type: none"> <li>- A store operation hits a shared line in the L2 cache.</li> <li>- A full cache line write misses the L2 cache or hits a shared line in the L2 cache.</li> </ul> |
| 6AH        | See Table 18-61 and Table 18-62. | BUS_TRANS_PWR     | Partial write bus transaction.            | This event counts partial write bus transactions.  |
| 6BH        | See Table 18-61 and Table 18-62. | BUS_TRANS_P       | Partial bus transactions.                 | This event counts all (read and write) partial bus transactions.   |
| 6CH        | See Table 18-61 and Table 18-62. | BUS_TRANS_IO      | IO bus transactions.                      | This event counts the number of completed I/O bus transactions as a result of IN and OUT instructions. The count does not include memory mapped IO.  |
| 6DH        | See Table 18-61 and Table 18-62. | BUS_TRANS_DEF     | Deferred bus transactions.                | This event counts the number of deferred transactions.   |
| 6EH        | See Table 18-61 and Table 18-62. | BUS_TRANS_BURST   | Burst (full cache-line) bus transactions. | This event counts burst (full cache line) transactions including: <ul style="list-style-type: none"> <li>- Burst reads.</li> <li>- RFOs.</li> <li>- Explicit writebacks.</li> <li>- Write combine lines.</li> </ul>  |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value                      | Event Name       | Definition                            | Description and Comment  |
|------------|----------------------------------|------------------|---------------------------------------|--|
| 6FH        | See Table 18-61 and Table 18-62. | BUS_TRANS_MEM    | Memory bus transactions.              | This event counts all memory bus transactions including:<br>- Burst transactions.<br>- Partial reads and writes.<br>- Invalidate transactions.<br>The BUS_TRANS_MEM count is the sum of BUS_TRANS_BURST, BUS_TRANS_P and BUS_TRANS_INVALID.  |
| 70H        | See Table 18-61 and Table 18-62. | BUS_TRANS_ANY    | All bus transactions.                 | This event counts all bus transactions. This includes:<br>- Memory transactions.<br>- IO transactions (non memory-mapped).<br>- Deferred transaction completion.<br>- Other less frequent transactions, such as interrupts.  |
| 77H        | See Table 18-61 and Table 18-64. | EXT_SNOOP        | External snoops.                      | This event counts the snoop responses to bus transactions. Responses can be counted separately by type and by bus agent.<br>Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.   |
| 7AH        | See Table 18-62.                 | BUS_HIT_DRV      | HIT signal asserted.                  | This event counts the number of bus cycles during which the processor drives the HIT# pin to signal HIT snoop response.<br>Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.  |
| 7BH        | See Table 18-62.                 | BUS_HITM_DRV     | HITM signal asserted.                 | This event counts the number of bus cycles during which the processor drives the HITM# pin to signal HITM snoop response.<br>NOTE: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.  |
| 7DH        | See Table 18-61.                 | BUSQ_EMPTY       | Bus queue is empty.                   | This event counts the number of cycles during which the core did not have any pending transactions in the bus queue.<br>Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled.   |
| 7EH        | See Table 18-61 and Table 18-62. | SNOOP_STALL_DRV  | Bus stalled for snoops.               | This event counts the number of times that the bus snoop stall signal is asserted. During the snoop stall cycles no new bus transactions requiring a snoop response can be initiated on the bus.<br>Note: This event is thread-independent and will not provide a count per logical processor when AnyThr is disabled. |
| 7FH        | See Table 18-61.                 | BUS_IO_WAIT      | IO requests waiting in the bus queue. | This event counts the number of core cycles during which IO requests wait in the bus queue. This event counts IO requests from the core.   |
| 80H        | 03H                              | ICACHE.ACCESSSES | Instruction fetches.                  | This event counts all instruction fetches, including uncacheable fetches.  |
| 80H        | 02H                              | ICACHE.MISSES    | Icache miss.                          | This event counts all instruction fetches that miss the Instruction cache or produce memory requests. This includes uncacheable fetches. An instruction fetch miss is counted only once and not once for every cycle it is outstanding.  |
| 82H        | 04H                              | ITLB.FLUSH       | ITLB flushes.                         | This event counts the number of ITLB flushes.  |
| 82H        | 02H                              | ITLB.MISSES      | ITLB misses.                          | This event counts the number of instruction fetches that miss the ITLB.  |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value | Event Name                       | Definition                                    | Description and Comment   |
|------------|-------------|----------------------------------|---|---|
| AAH        | 02H         | MACRO_INSTS.CISC_DECODED         | CISC macro instructions decoded.              | This event counts the number of complex instructions decoded, but not necessarily executed or retired. Only one complex instruction can be decoded at a time.   |
| AAH        | 03H         | MACRO_INSTS.ALL_DECODED          | All Instructions decoded.                     | This event counts the number of instructions decoded.   |
| B0H        | 00H         | SIMD_UOPS_EXEC.S                 | SIMD micro-ops executed (excluding stores).   | This event counts all the SIMD micro-ops executed. This event does not count MOVQ and MOVD stores from register to memory.  |
| B0H        | 80H         | SIMD_UOPS_EXEC.AR                | SIMD micro-ops retired (excluding stores).    | This event counts the number of SIMD saturated arithmetic micro-ops executed.   |
| B1H        | 00H         | SIMD_SAT_UOP_EXEC.S              | SIMD saturated arithmetic micro-ops executed. | This event counts the number of SIMD saturated arithmetic micro-ops executed.   |
| B1H        | 80H         | SIMD_SAT_UOP_EXEC.AR             | SIMD saturated arithmetic micro-ops retired.  | This event counts the number of SIMD saturated arithmetic micro-ops retired.  |
| B3H        | 01H         | SIMD_UOP_TYPE_EXEC.MUL.S         | SIMD packed multiply micro-ops executed.      | This event counts the number of SIMD packed multiply micro-ops executed.  |
| B3H        | 81H         | SIMD_UOP_TYPE_EXEC.MUL.AR        | SIMD packed multiply micro-ops retired.       | This event counts the number of SIMD packed multiply micro-ops retired.   |
| B3H        | 02H         | SIMD_UOP_TYPE_EXEC.SHIFT.S       | SIMD packed shift micro-ops executed.         | This event counts the number of SIMD packed shift micro-ops executed.   |
| B3H        | 82H         | SIMD_UOP_TYPE_EXEC.SHIFT.AR      | SIMD packed shift micro-ops retired.          | This event counts the number of SIMD packed shift micro-ops retired.  |
| B3H        | 04H         | SIMD_UOP_TYPE_EXEC.PACK.S        | SIMD pack micro-ops executed.                 | This event counts the number of SIMD pack micro-ops executed.   |
| B3H        | 84H         | SIMD_UOP_TYPE_EXEC.PACK.AR       | SIMD pack micro-ops retired.                  | This event counts the number of SIMD pack micro-ops retired.  |
| B3H        | 08H         | SIMD_UOP_TYPE_EXEC.UNPACK.S      | SIMD unpack micro-ops executed.               | This event counts the number of SIMD unpack micro-ops executed.   |
| B3H        | 88H         | SIMD_UOP_TYPE_EXEC.UNPACK.AR     | SIMD unpack micro-ops retired.                | This event counts the number of SIMD unpack micro-ops retired.  |
| B3H        | 10H         | SIMD_UOP_TYPE_EXEC.LOGICAL.S     | SIMD packed logical micro-ops executed.       | This event counts the number of SIMD packed logical micro-ops executed.   |
| B3H        | 90H         | SIMD_UOP_TYPE_EXEC.LOGICAL.AR    | SIMD packed logical micro-ops retired.        | This event counts the number of SIMD packed logical micro-ops retired.  |
| B3H        | 20H         | SIMD_UOP_TYPE_EXEC.ARITHMETIC.S  | SIMD packed arithmetic micro-ops executed.    | This event counts the number of SIMD packed arithmetic micro-ops executed.  |
| B3H        | A0H         | SIMD_UOP_TYPE_EXEC.ARITHMETIC.AR | SIMD packed arithmetic micro-ops retired.     | This event counts the number of SIMD packed arithmetic micro-ops retired.   |
| COH        | 00H         | INST_RETIRED.ANY_P               | Instructions retired (precise event).         | This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers. |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value | Event Name                        | Definition  | Description and Comment  |
|------------|-------------|-----------------------------------|---|--|
| N/A        | 00H         | INST_RETIRED.ANY                  | Instructions retired.   | This event counts the number of instructions that retire execution. For instructions that consist of multiple micro-ops, this event counts the retirement of the last micro-op of the instruction. The counter continues counting during hardware interrupts, traps, and inside interrupt handlers.  |
| C2H        | 10H         | UOPS_RETIRED.ANY                  | Micro-ops retired.  | This event counts the number of micro-ops retired. The processor decodes complex macro instructions into a sequence of simpler micro-ops. Most instructions are composed of one or two micro-ops. Some instructions are decoded into longer sequences such as repeat instructions, floating point transcendental instructions, and assists. In some cases micro-op sequences are fused or whole instructions are fused into one micro-op. See other UOPS_RETIRED events for differentiating retired fused and non-fused micro-ops.   |
| C3H        | 01H         | MACHINE_CLEAR.SMC                 | Self-Modifying Code detected.                                 | This event counts the number of times that a program writes to a code section. Self-modifying code causes a severe penalty in all Intel® architecture processors.  |
| C4H        | 00H         | BR_INST_RETIRED.ANY               | Retired branch instructions.                                  | This event counts the number of branch instructions retired.<br><b>This is an architectural performance event.</b>   |
| C4H        | 01H         | BR_INST_RETIRED.PRED_NOT_TAKEN    | Retired branch instructions that were predicted not-taken.    | This event counts the number of branch instructions retired that were correctly predicted to be not-taken.   |
| C4H        | 02H         | BR_INST_RETIRED.MISPRED_NOT_TAKEN | Retired branch instructions that were mispredicted not-taken. | This event counts the number of branch instructions retired that were mispredicted and not-taken.  |
| C4H        | 04H         | BR_INST_RETIRED.PRED_TAKEN        | Retired branch instructions that were predicted taken.        | This event counts the number of branch instructions retired that were correctly predicted to be taken.   |
| C4H        | 08H         | BR_INST_RETIRED.MISPRED_TAKEN     | Retired branch instructions that were mispredicted taken.     | This event counts the number of branch instructions retired that were mispredicted and taken.  |
| C4H        | 0AH         | BR_INST_RETIRED.MISPRED           | Retired mispredicted branch instructions (precise event).     | This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa. Mispredicted branches degrade the performance because the processor starts executing instructions along a wrong path it predicts. When the misprediction is discovered, all the instructions executed in the wrong path must be discarded, and the processor must start again on the correct path.<br><br>Using the Profile-Guided Optimization (PGO) features of the Intel® C++ compiler may help reduce branch mispredictions. See the compiler documentation for more information on this feature. |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value | Event Name  | Definition  | Description and Comment   |
|------------|-------------|---|---|---|
|            |             |   |   | <p>To determine the branch misprediction ratio, divide the BR_INST_RETIRED.MISPRED event count by the number of BR_INST_RETIRED.ANY event count. To determine the number of mispredicted branches per instruction, divide the number of mispredicted branches by the INST_RETIRED.ANY event count. To measure the impact of the branch mispredictions use the event RESOURCE_STALLS.BR_MISS_CLEAR.</p> <p>Tips:</p> <ul style="list-style-type: none"> <li>- See the optimization guide for tips on reducing branch mispredictions.</li> <li>- PGO's purpose is to have straight line code for the most frequent execution paths, reducing branches taken and increasing the "basic block" size, possibly also reducing the code footprint or working-set.</li> </ul>   |
| C4H        | 0CH         | BR_INST_RETIRED.TAKEN                               | Retired taken branch instructions.                        | This event counts the number of branches retired that were taken.   |
| C4H        | 0FH         | BR_INST_RETIRED.ANY1                                | Retired branch instructions.                              | This event counts the number of branch instructions retired that were mispredicted. This event is a duplicate of BR_INST_RETIRED.MISPRED.   |
| C5H        | 00H         | BR_INST_RETIRED.MISPRED                             | Retired mispredicted branch instructions (precise event). | <p>This event counts the number of retired branch instructions that were mispredicted by the processor. A branch misprediction occurs when the processor predicts that the branch would be taken, but it is not, or vice-versa. Mispredicted branches degrade the performance because the processor starts executing instructions along a wrong path it predicts. | C6H        | 01H         | CYCLES_INT_MASKED.<br>CYCLES_INT_MASKED             | Cycles during which interrupts are disabled.              | This event counts the number of cycles during which interrupts are disabled.  |
| C6H        | 02H         | CYCLES_INT_MASKED.<br>CYCLES_INT_PENDING_AND_MASKED | Cycles during which interrupts are pending and disabled.  | This event counts the number of cycles during which there are pending interrupts but interrupts are disabled.   |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value | Event Name                           | Definition   | Description and Comment  |
|------------|-------------|--------------------------------------|--|--|
| C7H        | 01H         | SIMD_INST_RETIRED.PACKED_SINGLE      | Retired Streaming SIMD Extensions (SSE) packed-single instructions.                  | This event counts the number of SSE packed-single instructions retired.  |
| C7H        | 02H         | SIMD_INST_RETIRED.SCALAR_SINGLE      | Retired Streaming SIMD Extensions (SSE) scalar-single instructions.                  | This event counts the number of SSE scalar-single instructions retired.  |
| C7H        | 04H         | SIMD_INST_RETIRED.PACKED_DOUBLE      | Retired Streaming SIMD Extensions 2 (SSE2) packed-double instructions.               | This event counts the number of SSE2 packed-double instructions retired.   |
| C7H        | 08H         | SIMD_INST_RETIRED.SCALAR_DOUBLE      | Retired Streaming SIMD Extensions 2 (SSE2) scalar-double instructions.               | This event counts the number of SSE2 scalar-double instructions retired.   |
| C7H        | 10H         | SIMD_INST_RETIRED.VECTOR             | Retired Streaming SIMD Extensions 2 (SSE2) vector instructions.                      | This event counts the number of SSE2 vector instructions retired.  |
| C7H        | 1FH         | SIMD_INST_RETIRED.ANY                | Retired Streaming SIMD instructions.   | This event counts the overall number of SIMD instructions retired. To count each type of SIMD instruction separately, use the following events:<br>SIMD_INST_RETIRED.PACKED_SINGLE<br>SIMD_INST_RETIRED.SCALAR_SINGLE<br>SIMD_INST_RETIRED.PACKED_DOUBLE<br>SIMD_INST_RETIRED.SCALAR_DOUBLE<br>SIMD_INST_RETIRED.VECTOR. |
| C8H        | 00H         | HW_INT_RCV                           | Hardware interrupts received.  | This event counts the number of hardware interrupts received by the processor. This event will count twice for dual-pipe micro-ops.  |
| CAH        | 01H         | SIMD_COMP_INST_RETIRED.PACKED_SINGLE | Retired computational Streaming SIMD Extensions (SSE) packed-single instructions.    | This event counts the number of computational SSE packed-single instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.         |
| CAH        | 02H         | SIMD_COMP_INST_RETIRED.SCALAR_SINGLE | Retired computational Streaming SIMD Extensions (SSE) scalar-single instructions.    | This event counts the number of computational SSE scalar-single instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.         |
| CAH        | 04H         | SIMD_COMP_INST_RETIRED.PACKED_DOUBLE | Retired computational Streaming SIMD Extensions 2 (SSE2) packed-double instructions. | This event counts the number of computational SSE2 packed-double instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.        |

**Table 19-29. Performance Events for 45 nm, 32 nm Intel® Atom™ Processors (Contd.)**

| Event Num. | Umask Value | Event Name                           | Definition   | Description and Comment  |
|------------|-------------|--------------------------------------|--|--|
| CAH        | 08H         | SIMD_COMP_INST_RETIRED.SCALAR_DOUBLE | Retired computational Streaming SIMD Extensions 2 (SSE2) scalar-double instructions. | This event counts the number of computational SSE2 scalar-double instructions retired. Computational instructions perform arithmetic computations, like add, multiply and divide. Instructions that perform load and store operations or logical operations, like XOR, OR, and AND are not counted by this event.  |
| CBH        | 01H         | MEM_LOAD_RETIRED.L2_HIT              | Retired loads that hit the L2 cache (precise event).                                 | This event counts the number of retired load operations that missed the L1 data cache and hit the L2 cache.  |
| CBH        | 02H         | MEM_LOAD_RETIRED.L2_MISS             | Retired loads that miss the L2 cache (precise event).                                | This event counts the number of retired load operations that missed the L2 cache.  |
| CBH        | 04H         | MEM_LOAD_RETIRED.DTLB_MISS           | Retired loads that miss the DTLB (precise event).                                    | This event counts the number of retired loads that missed the DTLB. The DTLB miss is not counted if the load operation causes a fault.   |
| CDH        | 00H         | SIMD_ASSIST                          | SIMD assists invoked.  | This event counts the number of SIMD assists invoked. SIMD assists are invoked when an EMMS instruction is executed after MMX™ technology code has changed the MMX state in the floating point stack. For example, these assists are required in the following cases.<br>Streaming SIMD Extensions (SSE) instructions:<br>1. Denormal input when the DAZ (Denormals Are Zeros) flag is off.<br>2. Underflow result when the FTZ (Flush To Zero) flag is off. |
| CEH        | 00H         | SIMD_INSTR_RETIRED                   | SIMD Instructions retired.   | This event counts the number of SIMD instructions that retired.  |
| CFH        | 00H         | SIMD_SAT_INSTR_RETIRED               | Saturated arithmetic instructions retired.   | This event counts the number of saturated arithmetic SIMD instructions that retired.   |
| E0H        | 01H         | BR_INST_DECODED                      | Branch instructions decoded.   | This event counts the number of branch instructions decoded.   |
| E4H        | 01H         | BOGUS_BR                             | Bogus branches.  | This event counts the number of byte sequences that were mistakenly detected as taken branch instructions. This results in a BACLEAR event and the BTB is flushed. This occurs mainly after task switches.   |
| E6H        | 01H         | BACLEAR.ANY                          | BACLEARs asserted.   | This event counts the number of times the front end is redirected for a branch prediction, mainly when an early branch prediction is corrected by other branch handling mechanisms in the front end. This can occur if the code has many branches such that they cannot be consumed by the branch predictor. Each Baclear asserted costs approximately 7 cycles. The effect on total execution time depends on the surrounding code.                         |

## 19.17 PERFORMANCE MONITORING EVENTS FOR INTEL® CORE™ SOLO AND INTEL® CORE™ DUO PROCESSORS

Table 19-30 lists model-specific performance events for Intel® Core™ Duo processors. If a model-specific event requires qualification in core specificity, it is indicated in the comment column. Table 19-30 also applies to Intel® Core™ Solo processors; bits in the unit mask corresponding to core-specificity are reserved and should be 00B.

**Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors**

| Event Num. | Event Mask Mnemonic | Umask Value | Description   | Comment  |
|------------|---------------------|-------------|---|--|
| 03H        | LD_Blocks           | 00H         | Load operations delayed due to store buffer blocks. The preceding store may be blocked due to unknown address, unknown data, or conflict due to partial overlap between the load and store.           |  |
| 04H        | SD_Drains           | 00H         | Cycles while draining store buffers.  |  |
| 05H        | Misalign_Mem_Ref    | 00H         | Misaligned data memory references (MOB splits of loads and stores).   |  |
| 06H        | Seg_Reg_Loads       | 00H         | Segment register loads.   |  |
| 07H        | SSE_PrefNta_Ret     | 00H         | SSE software prefetch instruction PREFETCHNTA retired.  |  |
| 07H        | SSE_PrefT1_Ret      | 01H         | SSE software prefetch instruction PREFETCHT1 retired.   |  |
| 07H        | SSE_PrefT2_Ret      | 02H         | SSE software prefetch instruction PREFETCHT2 retired.   |  |
| 07H        | SSE_NTStores_Ret    | 03H         | SSE streaming store instruction retired.  |  |
| 10H        | FP_Comps_Op_Exe     | 00H         | FP computational Instruction executed. FADD, FSUB, FCOM, FMULs, MUL, IMUL, FDIVs, DIV, IDIV, FPREMs, FSQRT are included; but exclude FADD or FMUL used in the middle of a transcendental instruction. |  |
| 11H        | FP_Assist           | 00H         | FP exceptions experienced microcode assists.  | IA32_PMC1 only.  |
| 12H        | Mul                 | 00H         | Multiply operations (a speculative count, including FP and integer multiplies).   | IA32_PMC1 only.  |
| 13H        | Div                 | 00H         | Divide operations (a speculative count, including FP and integer divisions).  | IA32_PMC1 only.  |
| 14H        | Cycles_Div_Busy     | 00H         | Cycles the divider is busy.   | IA32_PMC0 only.  |
| 21H        | L2_ADS              | 00H         | L2 Address strobes.   | Requires core-specificity.                               |
| 22H        | Dbus_Busy           | 00H         | Core cycle during which data bus was busy (increments by 4).  | Requires core-specificity.                               |
| 23H        | Dbus_Busy_Rd        | 00H         | Cycles data bus is busy transferring data to a core (increments by 4).  | Requires core-specificity.                               |
| 24H        | L2_Lines_In         | 00H         | L2 cache lines allocated.   | Requires core-specificity and HW prefetch qualification. |
| 25H        | L2_M_Lines_In       | 00H         | L2 Modified-state cache lines allocated.  | Requires core-specificity.                               |
| 26H        | L2_Lines_Out        | 00H         | L2 cache lines evicted.   | Requires core-specificity and HW prefetch qualification. |
| 27H        | L2_M_Lines_Out      | 00H         | L2 Modified-state cache lines evicted.  |  |

**Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)**

| Event Num. | Event Mask Mnemonic     | Umask Value                 | Description  | Comment   |
|------------|-------------------------|-----------------------------|--|---|
| 28H        | L2_IFetch               | Requires MESI qualification | L2 instruction fetches from instruction fetch unit (includes speculative fetches). | Requires core-specificity.                            |
| 29H        | L2_LD                   | Requires MESI qualification | L2 cache reads.  | Requires core-specificity.                            |
| 2AH        | L2_ST                   | Requires MESI qualification | L2 cache writes (includes speculation).  | Requires core-specificity.                            |
| 2EH        | L2_Rqsts                | Requires MESI qualification | L2 cache reference requests.   | Requires core-specificity, HW prefetch qualification. |
| 30H        | L2_Reject_Cycles        | Requires MESI qualification | Cycles L2 is busy and rejecting new requests.                                      |   |
| 32H        | L2_No_Request_Cycles    | Requires MESI qualification | Cycles there is no request to access L2.   |   |
| 3AH        | EST_Trans_All           | 00H                         | Any Intel Enhanced SpeedStep(R) Technology transitions.                            |   |
| 3AH        | EST_Trans_All           | 10H                         | Intel Enhanced SpeedStep Technology frequency transitions.                         |   |
| 3BH        | Thermal_Trip            | C0H                         | Duration in a thermal trip based on the current core clock.                        | Use edge trigger to count occurrence.                 |
| 3CH        | NonHlt_Ref_Cycles       | 01H                         | Non-halted bus cycles.   |   |
| 3CH        | Serial_Execution_Cycles | 02H                         | Non-halted bus cycles of this core executing code while the other core is halted.  |   |
| 40H        | DCache_Cache_LD         | Requires MESI qualification | L1 cacheable data read operations.   |   |
| 41H        | DCache_Cache_ST         | Requires MESI qualification | L1 cacheable data write operations.  |   |
| 42H        | DCache_Cache_Lock       | Requires MESI qualification | L1 cacheable lock read operations to invalid state.                                |   |
| 43H        | Data_Mem_Ref            | 01H                         | L1 data read and writes of cacheable and non-cacheable types.                      |   |
| 44H        | Data_Mem_Cache_Ref      | 02H                         | L1 data cacheable read and write operations.                                       |   |
| 45H        | DCache_Repl             | 0FH                         | L1 data cache line replacements.   |   |
| 46H        | DCache_M_Repl           | 00H                         | L1 data M-state cache line allocated.  |   |
| 47H        | DCache_M_Evict          | 00H                         | L1 data M-state cache line evicted.  |   |
| 48H        | DCache_Pend_Miss        | 00H                         | Weighted cycles of L1 miss outstanding.  | Use Cmask = 1 to count duration.                      |
| 49H        | Dtlb_Miss               | 00H                         | Data references that missed TLB.   |   |
| 4BH        | SSE_PrefNta_Miss        | 00H                         | PREFETCHNTA missed all caches.   |   |
| 4BH        | SSE_PrefT1_Miss         | 01H                         | PREFETCHT1 missed all caches.  |   |
| 4BH        | SSE_PrefT2_Miss         | 02H                         | PREFETCHT2 missed all caches.  |   |
| 4BH        | SSE_NTStores_Miss       | 03H                         | SSE streaming store instruction missed all caches.                                 |   |
| 4FH        | L1_Pref_Req             | 00H                         | L1 prefetch requests due to DCU cache misses.                                      | May overcount if request re-submitted.                |

**Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)**

| Event Num. | Event Mask Mnemonic | Umask Value  | Description  | Comment  |
|------------|---------------------|--|--|--|
| 60H        | Bus_Req_Outstanding | 00; Requires core-specificity, and agent specificity | Weighted cycles of cacheable bus data read requests. This event counts full-line read request from DCU or HW prefetcher, but not RFO, write, instruction fetches, or others. | Use Cmask = 1 to count duration.<br>Use Umask bit 12 to include HWP or exclude HWP separately.   |
| 61H        | Bus_BNR_Clocks      | 00H  | External bus cycles while BNR asserted.  |  |
| 62H        | Bus_DRDY_Clocks     | 00H  | External bus cycles while DRDY asserted.   | Requires agent specificity.  |
| 63H        | Bus_Locks_Clocks    | 00H  | External bus cycles while bus lock signal asserted.  | Requires core specificity.   |
| 64H        | Bus_Data_Rcv        | 40H  | Number of data chunks received by this processor.  |  |
| 65H        | Bus_Trans_Brd       | See comment.   | Burst read bus transactions (data or code).  | Requires core specificity.   |
| 66H        | Bus_Trans_RFO       | See comment.   | Completed read for ownership (RFO) transactions.   | Requires agent specificity.<br>Requires core specificity.<br>Each transaction counts its address strobe.<br>Retried transaction may be counted more than once. |
| 68H        | Bus_Trans_Ifetch    | See comment.   | Completed instruction fetch transactions.  |  |
| 69H        | Bus_Trans_Inval     | See comment.   | Completed invalidate transactions.   |  |
| 6AH        | Bus_Trans_Pwr       | See comment.   | Completed partial write transactions.  |  |
| 6BH        | Bus_Trans_P         | See comment.   | Completed partial transactions (include partial read + partial write + line write).  |  |
| 6CH        | Bus_Trans_IO        | See comment.   | Completed I/O transactions (read and write).   | Requires core specificity.<br>Retried transaction may be counted more than once.   |
| 6DH        | Bus_Trans_Def       | 20H  | Completed defer transactions.  |  |
| 67H        | Bus_Trans_WB        | COH  | Completed writeback transactions from DCU (does not include L2 writebacks).  |  |
| 6EH        | Bus_Trans_Burst     | COH  | Completed burst transactions (full line transactions include reads, write, RFO, and writebacks).   |  |
| 6FH        | Bus_Trans_Mem       | COH  | Completed memory transactions. This includes Bus_Trans_Burst + Bus_Trans_P+Bus_Trans_Inval.  | Retried transaction may be counted more than once.   |
| 70H        | Bus_Trans_Any       | COH  | Any completed bus transactions.  |  |
| 77H        | Bus_Snoops          | 00H  | Counts any snoop on the bus.   | Requires MESI qualification.<br>Requires agent specificity.  |
| 78H        | DCU_Snoop_To_Share  | 01H  | DCU snoops to share-state L1 cache line due to L1 misses.  | Requires core specificity.   |
| 7DH        | Bus_Not_In_Use      | 00H  | Number of cycles there is no transaction from the core.  | Requires core specificity.   |
| 7EH        | Bus_Snoop_Stall     | 00H  | Number of bus cycles while bus snoop is stalled.   |  |
| 80H        | ICache_Reads        | 00H  | Number of instruction fetches from ICache, streaming buffers (both cacheable and uncacheable fetches).   |  |

**Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)**

| Event Num. | Event Mask Mnemonic    | Umask Value | Description   | Comment |
|------------|------------------------|-------------|---|---------|
| 81H        | ICache_Misses          | 00H         | Number of instruction fetch misses from ICache, streaming buffers.  |         |
| 85H        | ITLB_Misses            | 00H         | Number of iTLB misses.  |         |
| 86H        | IFU_Mem_Stall          | 00H         | Cycles IFU is stalled while waiting for data from memory.   |         |
| 87H        | ILD_Stall              | 00H         | Number of instruction length decoder stalls (Counts number of LCP stalls).  |         |
| 88H        | Br_Inst_Exec           | 00H         | Branch instruction executed (includes speculation).   |         |
| 89H        | Br_Misssp_Exec         | 00H         | Branch instructions executed and mispredicted at execution (includes branches that do not have prediction or mispredicted). |         |
| 8AH        | Br_BAC_Misssp_Exec     | 00H         | Branch instructions executed that were mispredicted at front end.   |         |
| 8BH        | Br_Cnd_Exec            | 00H         | Conditional branch instructions executed.   |         |
| 8CH        | Br_Cnd_Misssp_Exec     | 00H         | Conditional branch instructions executed that were mispredicted.  |         |
| 8DH        | Br_Ind_Exec            | 00H         | Indirect branch instructions executed.  |         |
| 8EH        | Br_Ind_Misssp_Exec     | 00H         | Indirect branch instructions executed that were mispredicted.   |         |
| 8FH        | Br_Ret_Exec            | 00H         | Return branch instructions executed.  |         |
| 90H        | Br_Ret_Misssp_Exec     | 00H         | Return branch instructions executed that were mispredicted.   |         |
| 91H        | Br_Ret_BAC_Misssp_Exec | 00H         | Return branch instructions executed that were mispredicted at the front end.  |         |
| 92H        | Br_Call_Exec           | 00H         | Return call instructions executed.  |         |
| 93H        | Br_Call_Misssp_Exec    | 00H         | Return call instructions executed that were mispredicted.   |         |
| 94H        | Br_Ind_Call_Exec       | 00H         | Indirect call branch instructions executed.   |         |
| A2H        | Resource_Stall         | 00H         | Cycles while there is a resource related stall (renaming, buffer entries) as seen by allocator.                             |         |
| B0H        | MMX_Instr_Exec         | 00H         | Number of MMX instructions executed (does not include MOVQ and MOVD stores).  |         |
| B1H        | SIMD_Int_Sat_Exec      | 00H         | Number of SIMD Integer saturating instructions executed.  |         |
| B3H        | SIMD_Int_Pmul_Exec     | 01H         | Number of SIMD Integer packed multiply instructions executed.   |         |
| B3H        | SIMD_Int_Psft_Exec     | 02H         | Number of SIMD Integer packed shift instructions executed.  |         |
| B3H        | SIMD_Int_Pck_Exec      | 04H         | Number of SIMD Integer pack operations instruction executed.  |         |
| B3H        | SIMD_Int_Upck_Exec     | 08H         | Number of SIMD Integer unpack instructions executed.  |         |
| B3H        | SIMD_Int_Plog_Exec     | 10H         | Number of SIMD Integer packed logical instructions executed.  |         |
| B3H        | SIMD_Int_Pari_Exec     | 20H         | Number of SIMD Integer packed arithmetic instructions executed.   |         |

**Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)**

| Event Num. | Event Mask Mnemonic       | Umask Value | Description  | Comment             |
|------------|---------------------------|-------------|--|---------------------|
| C0H        | Instr_Ret                 | 00H         | Number of instruction retired (Macro fused instruction count as 2).                                      |                     |
| C1H        | FP_Comp_Instr_Ret         | 00H         | Number of FP compute instructions retired (X87 instruction or instruction that contains X87 operations). | Use IA32_PMC0 only. |
| C2H        | Uops_Ret                  | 00H         | Number of micro-ops retired (include fused uops).  |                     |
| C3H        | SMC_Detected              | 00H         | Number of times self-modifying code condition detected.  |                     |
| C4H        | Br_Instr_Ret              | 00H         | Number of branch instructions retired.   |                     |
| C5H        | Br_MisPred_Ret            | 00H         | Number of mispredicted branch instructions retired.  |                     |
| C6H        | Cycles_Int_Masked         | 00H         | Cycles while interrupt is disabled.  |                     |
| C7H        | Cycles_Int_Pedning_Masked | 00H         | Cycles while interrupt is disabled and interrupts are pending.   |                     |
| C8H        | HW_Int_Rx                 | 00H         | Number of hardware interrupts received.  |                     |
| C9H        | Br_Taken_Ret              | 00H         | Number of taken branch instruction retired.  |                     |
| CAH        | Br_MisPred_Taken_Ret      | 00H         | Number of taken and mispredicted branch instructions retired.  |                     |
| CCH        | MMX_FP_Trans              | 00H         | Number of transitions from MMX to X87.   |                     |
| CCH        | FP_MMX_Trans              | 01H         | Number of transitions from X87 to MMX.   |                     |
| CDH        | MMX_Assist                | 00H         | Number of EMMS executed.   |                     |
| CEH        | MMX_Instr_Ret             | 00H         | Number of MMX instruction retired.   |                     |
| D0H        | Instr_Decoded             | 00H         | Number of instruction decoded.   |                     |
| D7H        | ESP_Uops                  | 00H         | Number of ESP folding instruction decoded.   |                     |
| D8H        | SIMD_FP_SP_Ret            | 00H         | Number of SSE/SSE2 single precision instructions retired (packed and scalar).                            |                     |
| D8H        | SIMD_FP_SP_S_Ret          | 01H         | Number of SSE/SSE2 scalar single precision instructions retired.   |                     |
| D8H        | SIMD_FP_DP_P_Ret          | 02H         | Number of SSE/SSE2 packed double precision instructions retired.   |                     |
| D8H        | SIMD_FP_DP_S_Ret          | 03H         | Number of SSE/SSE2 scalar double precision instructions retired.   |                     |
| D8H        | SIMD_Int_128_Ret          | 04H         | Number of SSE2 128 bit integer instructions retired.   |                     |
| D9H        | SIMD_FP_SP_P_Comp_Ret     | 00H         | Number of SSE/SSE2 packed single precision compute instructions retired (does not include AND, OR, XOR). |                     |
| D9H        | SIMD_FP_SP_S_Comp_Ret     | 01H         | Number of SSE/SSE2 scalar single precision compute instructions retired (does not include AND, OR, XOR). |                     |
| D9H        | SIMD_FP_DP_P_Comp_Ret     | 02H         | Number of SSE/SSE2 packed double precision compute instructions retired (does not include AND, OR, XOR). |                     |
| D9H        | SIMD_FP_DP_S_Comp_Ret     | 03H         | Number of SSE/SSE2 scalar double precision compute instructions retired (does not include AND, OR, XOR). |                     |

**Table 19-30. Performance Events in Intel® Core™ Solo and Intel® Core™ Duo Processors (Contd.)**

| Event Num. | Event Mask Mnemonic | Umask Value | Description  | Comment |
|------------|---------------------|-------------|--|---------|
| DAH        | Fused_Uops_Ret      | 00H         | All fused uops retired.  |         |
| DAH        | Fused_Ld_Uops_Ret   | 01H         | Fused load uops retired.   |         |
| DAH        | Fused_St_Uops_Ret   | 02H         | Fused store uops retired.  |         |
| DBH        | Unfusion            | 00H         | Number of unfusion events in the ROB (due to exception).         |         |
| E0H        | Br_Instr_Decoded    | 00H         | Branch instructions decoded.                                     |         |
| E2H        | BTB_Misses          | 00H         | Number of branches the BTB did not produce a prediction.         |         |
| E4H        | Br_Bogus            | 00H         | Number of bogus branches.  |         |
| E6H        | BAClears            | 00H         | Number of BAClears asserted.                                     |         |
| F0H        | Pref_Rqsts_Up       | 00H         | Number of hardware prefetch requests issued in forward streams.  |         |
| F8H        | Pref_Rqsts_Dn       | 00H         | Number of hardware prefetch requests issued in backward streams. |         |

## 19.18 PENTIUM® 4 AND INTEL® XEON® PROCESSOR PERFORMANCE MONITORING EVENTS

Tables 19-31, 19-32 and 19-33 list performance monitoring events that can be counted or sampled on processors based on Intel NetBurst® microarchitecture. Table 19-31 lists the non-retirement events, and Table 19-32 lists the at-retirement events. Tables 19-34, 19-35, and 19-36 describes three sets of parameters that are available for three of the at-retirement counting events defined in Table 19-32. Table 19-37 shows which of the non-retirement and at retirement events are logical processor specific (TS) (see Section 18.6.4.4, "Performance Monitoring Events") and which are non-logical processor specific (TI).

Some of the Pentium 4 and Intel Xeon processor performance monitoring events may be available only to specific models. The performance monitoring events listed in Tables 19-31 and 19-32 apply to processors with CPUID signature that matches family encoding 15, model encoding 0, 1, 2 3, 4, or 6. Table applies to processors with a CPUID signature that matches family encoding 15, model encoding 3, 4 or 6.

The functionality of performance monitoring events in Pentium 4 and Intel Xeon processors is also available when IA-32e mode is enabled.

**Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting**

| Event Name      | Event Parameters         | Parameter Value              | Description   |
|-----------------|--------------------------|------------------------------|---|
| TC_deliver_mode |                          |                              | This event counts the duration (in clock cycles) of the operating modes of the trace cache and decode engine in the processor package. The mode is specified by one or more of the event mask bits. |
|                 | ESCR restrictions        | MSR_TC_ESCR0<br>MSR_TC_ESCR1 |   |
|                 | Counter numbers per ESCR | ESCR0: 4, 5<br>ESCR1: 6, 7   |   |
|                 | ESCR Event Select        | 01H                          | ESCR[31:25]   |

**Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)**

| Event Name        | Event Parameters         | Parameter Value                | Description   |
|-------------------|--------------------------|--------------------------------|---|
|                   | ESCR Event Mask          | Bit                            | ESCR[24:9]  |
|                   |                          | 0: DD                          | Both logical processors are in deliver mode.  |
|                   |                          | 1: DB                          | Logical processor 0 is in deliver mode and logical processor 1 is in build mode.  |
|                   |                          | 2: DI                          | Logical processor 0 is in deliver mode and logical processor 1 is either halted, under a machine clear condition or transitioning to a long microcode flow.   |
|                   |                          | 3: BD                          | Logical processor 0 is in build mode and logical processor 1 is in deliver mode.  |
|                   |                          | 4: BB                          | Both logical processors are in build mode.  |
|                   |                          | 5: BI                          | Logical processor 0 is in build mode and logical processor 1 is either halted, under a machine clear condition or transitioning to a long microcode flow.   |
|                   |                          | 6: ID                          | Logical processor 0 is either halted, under a machine clear condition or transitioning to a long microcode flow. Logical processor 1 is in deliver mode.  |
|                   |                          | 7: IB                          | Logical processor 0 is either halted, under a machine clear condition or transitioning to a long microcode flow. Logical processor 1 is in build mode.  |
|                   |                          |                                |   |
|                   | CCCR Select              | 01H                            | CCCR[15:13]   |
|                   | Event Specific Notes     |                                | If only one logical processor is available from a physical processor package, the event mask should be interpreted as logical processor 1 is halted. Event mask bit 2 was previously known as "DELIVER", bit 5 was previously known as "BUILD". |
| BPU_fetch_request |                          |                                | This event counts instruction fetch requests of specified request type by the Branch Prediction unit. Specify one or more mask bits to qualify the request type(s).   |
|                   | ESCR restrictions        | MSR_BPU_ESCR0<br>MSR_BPU_ESCR1 |   |
|                   | Counter numbers per ESCR | ESCR0: 0, 1<br>ESCR1: 2, 3     |   |
|                   | ESCR Event Select        | 03H                            | ESCR[31:25]   |
|                   | ESCR Event Mask          | Bit 0: TCMISS                  | ESCR[24:9]<br>Trace cache lookup miss   |
|                   | CCCR Select              | 00H                            | CCCR[15:13]   |

**Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)**

| Event Name      | Event Parameters         | Parameter Value                       | Description  |
|-----------------|--------------------------|---------------------------------------|--|
| ITLB_reference  |                          |                                       | This event counts translations using the Instruction Translation Look-aside Buffer (ITLB).   |
|                 | ESCR restrictions        | MSR_ITLB_ESCR0<br>MSR_ITLB_ESCR1      |  |
|                 | Counter numbers per ESCR | ESCR0: 0, 1<br>ESCR1: 2, 3            |  |
|                 | ESCR Event Select        | 18H                                   | ESCR[31:25]  |
|                 | ESCR Event Mask          | Bit<br>0: HIT<br>1: MISS<br>2: HIT_UC | ESCR[24:9]<br><br>ITLB hit<br>ITLB miss<br>Uncacheable ITLB hit  |
|                 | CCCR Select              | 03H                                   | CCCR[15:13]  |
|                 | Event Specific Notes     |                                       | All page references regardless of the page size are looked up as actual 4-KByte pages. Use the page_walk_type event with the ITMISS mask for a more conservative count.                  |
| memory_cancel   |                          |                                       | This event counts the canceling of various type of request in the Data cache Address Control unit (DAC). Specify one or more mask bits to select the type of requests that are canceled. |
|                 | ESCR restrictions        | MSR_DAC_ESCR0<br>MSR_DAC_ESCR1        |  |
|                 | Counter numbers per ESCR | ESCR0: 8, 9<br>ESCR1: 10, 11          |  |
|                 | ESCR Event Select        | 02H                                   | ESCR[31:25]  |
|                 | ESCR Event Mask          | Bit<br>2: ST_RB_FULL<br>3: 64K_CONF   | ESCR[24:9]<br><br>Replayed because no store request buffer is available.<br>Conflicts due to 64-KByte aliasing.  |
|                 | CCCR Select              | 05H                                   | CCCR[15:13]  |
|                 | Event Specific Notes     |                                       | All_CACHE_MISS includes uncacheable memory in count.   |
| memory_complete |                          |                                       | This event counts the completion of a load split, store split, uncacheable (UC) split, or UC load. Specify one or more mask bits to select the operations to be counted.                 |
|                 | ESCR restrictions        | MSR_SAAT_ESCR0<br>MSR_SAAT_ESCR1      |  |

**Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)**

| Event Name     | Event Parameters     | Parameter Value  | Description  |
|----------------|----------------------|------------------|--|
|                |                      | Bit              | ESCR[24:9]   |
|                |                      | 0: RD_2ndL_HITS  | Read 2nd level cache hit Shared (includes load and RFO).   |
|                |                      | 1: RD_2ndL_HITE  | Read 2nd level cache hit Exclusive (includes load and RFO).  |
|                |                      | 2: RD_2ndL_HITM  | Read 2nd level cache hit Modified (includes load and RFO).   |
|                |                      | 3: RD_3rdL_HITS  | Read 3rd level cache hit Shared (includes load and RFO).   |
|                |                      | 4: RD_3rdL_HITE  | Read 3rd level cache hit Exclusive (includes load and RFO).  |
|                |                      | 5: RD_3rdL_HITM  | Read 3rd level cache hit Modified (includes load and RFO).   |
|                | ESCR Event Mask      | 8: RD_2ndL_MISS  | Read 2nd level cache miss (includes load and RFO).   |
|                |                      | 9: RD_3rdL_MISS  | Read 3rd level cache miss (includes load and RFO).   |
|                |                      | 10: WR_2ndL_MISS | A Writeback lookup from DAC misses the 2nd level cache (unlikely to happen).   |
|                | CCCR Select          | 07H              | CCCR[15:13]  |
|                | Event Specific Notes |                  | <p>1: The implementation of this event in current Pentium 4 and Xeon processors treats either a load operation or a request for ownership (RFO) request as a “read” type operation.</p> <p>2: Currently this event causes both over and undercounting by as much as a factor of two due to an erratum.</p> <p>3: It is possible for a transaction that is started as a prefetch to change the transaction’s internal status, making it no longer a prefetch. or change the access result status (hit, miss) as seen by this event.</p>   |
| IOQ_allocation |                      |                  | <p>This event counts the various types of transactions on the bus. A count is generated each time a transaction is allocated into the IOQ that matches the specified mask bits. An allocated entry can be a sector (64 bytes) or a chunks of 8 bytes.</p> <p>Requests are counted once per retry. The event mask bits constitute 4 bit fields. A transaction type is specified by interpreting the values of each bit field.</p> <p>Specify one or more event mask bits in a bit field to select the value of the bit field.</p> <p>Each field (bits 0-4 are one field) are independent of and can be ORed with the others. The request type field is further combined with bit 5 and 6 to form a binary expression. Bits 7 and 8 form a bit field to specify the memory type of the target address.</p> <p>Bits 13 and 14 form a bit field to specify the source agent of the request. Bit 15 affects read operation only. The event is triggered by evaluating the logical expression: (((Request type) OR Bit 5 OR Bit 6) OR (Memory type)) AND (Source agent).</p> |

**Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)**

| Event Name | Event Parameters         | Parameter Value  | Description  |

|            | CCCR Select              | 06H  | CCCR[15:13]  |
|            | Event Specific Notes     |  | 1: If PREFETCH bit is cleared, sectors fetched using prefetch are excluded in the counts. If PREFETCH bit is set, all sectors or chunks read are counted.<br><br>2: Specify the edge trigger in CCCR to avoid double counting.   |
|            |                          |  | 3: The mapping of interpreted bit field values to transaction types may differ with different processor model implementations of the Pentium 4 processor family. Applications that program performance monitoring events should use CPUID to determine processor models when using this event. The logic equations that trigger the event are model-specific (see 4a and 4b below).<br><br>4a: For Pentium 4 and Xeon Processors starting with CPUID Model field encoding equal to 2 or greater, this event is triggered by evaluating the logical expression ((Request type) and (Bit 5 or Bit 6) and (Memory type) and (Source agent)).<br><br>4b: For Pentium 4 and Xeon Processors with CPUID Model field encoding less than 2, this event is triggered by evaluating the logical expression [((Request type) or Bit 5 or Bit 6) or (Memory type)] and (Source agent). Note that event mask bits for memory type are ignored if either ALL_READ or ALL_WRITE is specified.<br><br>5: This event is known to ignore CPL in early implementations of Pentium 4 and Xeon Processors. Both user requests and OS requests are included in the count. This behavior is fixed starting with Pentium 4 and Xeon Processors with CPUID signature F27H (Family 15, Model 2, Stepping 7). |

**Table 19-31. Performance Monitoring Events Supported by Intel NetBurst® Microarchitecture for Non-Retirement Counting (Contd.)**

| Event Name         | Event Parameters         | Parameter Value  | Description   |
|--------------------|--------------------------|--|---|
|                    |                          |  | <p>6: For write-through (WT) and write-protected (WP) memory types, this event counts reads as the number of 64-byte sectors. Writes are counted by individual chunks.</p> <p>7: For uncacheable (UC) memory types, this event counts the number of 8-byte chunks allocated.</p> <p>8: For Pentium 4 and Xeon Processors with CPUID Signature less than F27H, only MSR_FSB_ESCR0 is available.</p>  |
| IOQ_active_entries |                          |  | <p>This event counts the number of entries (clipped at 15) in the IOQ that are active. An allocated entry can be a sector (64 bytes) or a chunks of 8 bytes.</p> <p>The event must be programmed in conjunction with IOQ_allocation. Specify one or more event mask bits to select the transactions that is counted.</p>  |
|                    | ESCR restrictions        | MSR_FSB_ESCR1  |   |
|                    | Counter numbers per ESCR | ESCR1: 2, 3  |   |
|                    | ESCR Event Select        | 01AH   | ESCR[30:25]   |
|                    | ESCR Event Mask          | Bits<br>0-4 (single field)<br>5: ALL_READ<br>6: ALL_WRITE<br>7: MEM_UC<br>8: MEM_WC<br>9: MEM_WT<br>10: MEM_WP<br>11: MEM_WB<br>13: OWN<br>14: OTHER<br>15: PREFETCH | ESCR[24:9]<br><br>Bus request type (use 00001 for invalid or default).<br>Count read entries.<br>Count write entries.<br>Count UC memory access entries.<br>Count WC memory access entries.<br>Count write-through (WT) memory access entries.<br>Count write-protected (WP) memory access entries.<br>Count WB memory access entries.<br>Count all store requests driven by processor, as opposed to other processor or DMA.<br>Count all requests driven by other processors or DMA.<br>Include HW and SW prefetch requests in the count.   |

|                  | CCCR Select              | 01H                              | CCCR[15:13]  |
|                  | Event Specific Notes     |                                  | <p>1: Not all requests for assists are actually taken. This event is known to overcount in that it counts requests for assists from instructions on the non-retired path that do not incur a performance penalty. An assist is actually taken only for non-bogus <math>\mu</math>ops. Any appreciable counts for this event are an indication that the DAZ or FTZ bit should be set and/or the source code should be changed to eliminate the condition.</p> <p>2: Two common situations for an SSE/SSE2/SSE3 operation needing an assist are: (1) when a denormal constant is used as an input and the Denormals-Are-Zero (DAZ) mode is not set, (2) when the input operand uses the underflowed result of a previous SSE/SSE2/SSE3 operation and neither the DAZ nor Flush-To-Zero (FTZ) modes are set.</p> <p>3: Enabling the DAZ mode prevents SSE/SSE2/SSE3 operations from needing assists in the first situation. Enabling the FTZ mode prevents SSE/SSE2/SSE3 operations from needing assists in the second situation.</p> |

**Table 19-33. Intel NetBurst® Microarchitecture Model-Specific Performance Monitoring Events  
(For Model Encoding 3, 4 or 6)**

| Event Name      | Event Parameters         | Parameter Value                        | Description  |
|-----------------|--------------------------|--|--|
| instr_completed |                          |  | This event counts instructions that have completed and retired during a clock cycle. Mask bits specify whether the instruction is bogus or non-bogus and whether they are: |
|                 | ESCR restrictions        | MSR_CRU_ESCR0<br>MSR_CRU_ESCR1         |  |
|                 | Counter numbers per ESCR | ESCR0: 12, 13, 16<br>ESCR1: 14, 15, 17 |  |
|                 | ESCR Event Select        | 07H                                    | ESCR[31:25]  |
|                 | ESCR Event Mask          | Bit<br>0: NBOGUS<br>1: BOGUS           | ESCR[24:9]<br><br>Non-bogus instructions<br>Bogus instructions   |
|                 | CCCR Select              | 04H                                    | CCCR[15:13]  |
|                 | Event Specific Notes     |  | This metric differs from instr_retired, since it counts instructions completed, rather than the number of times that instructions started.                                 |
|                 | Can Support PEBS         | No                                     |  |

**Table 19-34. List of Metrics Available for Front\_end Tagging (For Front\_end Event Only)**

| Front-end metric <sup>1</sup> | MSR_TC_PRECISE_EVENT MSR Bit field | Additional MSR   | Event mask value for Front_end_event |
|-------------------------------|------------------------------------|--|--------------------------------------|
| memory_loads                  | None                               | Set TAGLOADS bit in ESCR corresponding to event Uop_Type.      | NBOGUS                               |
| memory_stores                 | None                               | Set TAGSTORES bit in the ESCR corresponding to event Uop_Type. | NBOGUS                               |

**NOTES:**

1. There may be some undercounting of front end events when there is an overflow or underflow of the floating point stack.

**Table 19-35. List of Metrics Available for Execution Tagging (For Execution Event Only)**

| Execution metric              | Upstream ESCR  | TagValue in Upstream ESCR | Event mask value for execution_event |
|-------------------------------|--|---------------------------|--------------------------------------|
| packed_SP_retired             | Set ALL bit in event mask, TagUop bit in ESCR of packed_SP_uop.                | 1                         | NBOGUS0                              |
| packed_DP_retired             | Set ALL bit in event mask, TagUop bit in ESCR of packed_DP_uop.                | 1                         | NBOGUS0                              |
| scalar_SP_retired             | Set ALL bit in event mask, TagUop bit in ESCR of scalar_SP_uop.                | 1                         | NBOGUS0                              |
| scalar_DP_retired             | Set ALL bit in event mask, TagUop bit in ESCR of scalar_DP_uop.                | 1                         | NBOGUS0                              |
| 128_bit_MMX_retired           | Set ALL bit in event mask, TagUop bit in ESCR of 128_bit_MMX_uop.              | 1                         | NBOGUS0                              |
| 64_bit_MMX_retired            | Set ALL bit in event mask, TagUop bit in ESCR of 64_bit_MMX_uop.               | 1                         | NBOGUS0                              |
| X87_FP_retired                | Set ALL bit in event mask, TagUop bit in ESCR of x87_FP_uop.                   | 1                         | NBOGUS0                              |
| X87_SIMD_memory_moves_retired | Set ALLP0, ALLP2 bits in event mask, TagUop bit in ESCR of X87_SIMD_moves_uop. | 1                         | NBOGUS0                              |

**Table 19-36. List of Metrics Available for Replay Tagging (For Replay Event Only)**

| Replay metric <sup>1</sup>                | IA32_PEBs_ENABLE Field to Set  | MSR_PEBs_MATRIX_VERT Bit Field to Set | Additional MSR/ Event | Event Mask Value for Replay_event |

**Table 19-36. List of Metrics Available for Replay Tagging (For Replay Event Only) (Contd.)**

| Replay metric <sup>1</sup>           | IA32_PEBS_ENABLE Field to Set | MSR_PEBS_MATRIX_VERT Bit Field to Set | Additional MSR/ Event   | Event Mask Value for Replay_event |
|--------------------------------------|-------------------------------|---------------------------------------|---|-----------------------------------|
| MOB_load_replay_retired <sup>3</sup> | Bit 9, Bit 24, Bit 25         | Bit 0                                 | Select MOB_load_replay event and set PARTIAL_DATA and UNALGN_ADDR bit.                    | NBOGUS                            |
| split_load_retired                   | Bit 10, Bit 24, Bit 25        | Bit 0                                 | Select load_port_replay event with the MSR_SAAT_ESCR1 MSR and set the SPLIT_LD mask bit.  | NBOGUS                            |
| split_store_retired                  | Bit 10, Bit 24, Bit 25        | Bit 1                                 | Select store_port_replay event with the MSR_SAAT_ESCR0 MSR and set the SPLIT_ST mask bit. | NBOGUS                            |

**NOTES:**

1. Certain kinds of  $\mu$ ops cannot be tagged. These include I/O operations, UC and locked accesses, returns, and far transfers.
2. 2nd-level misses retired does not count all 2nd-level misses. It only includes those references that are found to be misses by the fast detection logic and not those that are later found to be misses.
3. While there are several causes for a MOB replay, the event counted with this event mask setting is the case where the data from a load that would otherwise be forwarded is not an aligned subset of the data from a preceding store.

Table 19-37. Event Mask Qualification for Logical Processors

| Event Type     | Event Name          | Event Masks, ESCR[24:9]   | TS or TI   |

## 19.19 PERFORMANCE MONITORING EVENTS FOR INTEL® PENTIUM® M PROCESSORS

The Pentium M processor's performance monitoring events are based on monitoring events for the P6 family of processors. All of these performance events are model specific for the Pentium M processor and are not available in this form in other processors. Table 19-38 lists the performance monitoring events that were added in the Pentium M processor.

**Table 19-38. Performance Monitoring Events on Intel® Pentium® M Processors**

| Name                    | Hex Values | Descriptions   |
|-------------------------|------------|--|
| Power Management        |            |  |
| EMON_EST_TRANS          | 58H        | Number of Enhanced Intel SpeedStep technology transitions:<br>Mask = 00H - All transitions<br>Mask = 02H - Only Frequency transitions      |
| EMON_THERMAL_TRIP       | 59H        | Duration/Occurrences in thermal trip; to count number of thermal trips: bit 22 in PerfEvtSel0/1 needs to be set to enable edge detect.     |
| BPU                     |            |  |
| BR_INST_EXEC            | 88H        | Branch instructions that were executed (not necessarily retired).  |
| BR_MISSP_EXEC           | 89H        | Branch instructions executed that were mispredicted at execution.  |
| BR_BAC_MISSP_EXEC       | 8AH        | Branch instructions executed that were mispredicted at front end (BAC).  |
| BR_CND_EXEC             | 8BH        | Conditional branch instructions that were executed.  |
| BR_CND_MISSP_EXEC       | 8CH        | Conditional branch instructions executed that were mispredicted.   |
| BR_IND_EXEC             | 8DH        | Indirect branch instructions executed.   |
| BR_IND_MISSP_EXEC       | 8EH        | Indirect branch instructions executed that were mispredicted.  |
| BR_RET_EXEC             | 8FH        | Return branch instructions executed.   |
| BR_RET_MISSP_EXEC       | 90H        | Return branch instructions executed that were mispredicted at execution.   |
| BR_RET_BAC_MISSP_EXEC   | 91H        | Return branch instructions executed that were mispredicted at front end (BAC).   |
| BR_CALL_EXEC            | 92H        | CALL instruction executed.   |
| BR_CALL_MISSP_EXEC      | 93H        | CALL instruction executed and miss predicted.  |
| BR_IND_CALL_EXEC        | 94H        | Indirect CALL instructions executed.   |
| Decoder                 |            |  |
| EMON_SIMD_INSTR_RETIRED | CEH        | Number of retired MMX instructions.  |
| EMON_SYNCH_UOPS         | D3H        | Sync micro-ops   |
| EMON_ESP_UOPS           | D7H        | Total number of micro-ops  |
| EMON_FUSED_UOPS_RET     | DAH        | Number of retired fused micro-ops:<br>Mask = 0 - Fused micro-ops<br>Mask = 1 - Only load+Op micro-ops<br>Mask = 2 - Only std+sta micro-ops |
| EMON_UNFUSION           | DBH        | Number of unfusion events in the ROB, happened on a FP exception to a fused $\mu$ op.  |
| Prefetcher              |            |  |
| EMON_PREF_RQSTS_UP      | FOH        | Number of upward prefetches issued.  |
| EMON_PREF_RQSTS_DN      | F8H        | Number of downward prefetches issued.  |

A number of P6 family processor performance monitoring events are modified for the Pentium M processor. Table 19-39 lists the performance monitoring events that were changed in the Pentium M processor, and differ from performance monitoring events for the P6 family of processors.

**Table 19-39. Performance Monitoring Events Modified on Intel® Pentium® M Processors**

| Name                            | Hex Values | Descriptions  |   |
|---------------------------------|------------|---|---|
| CPU_CLK_UNHALTED                | 79H        | Number of cycles during which the processor is not halted, and not in a thermal trip.   |   |
| EMON_SSE_SSE2_INST_RETIRED      | D8H        | Streaming SIMD Extensions Instructions Retired:<br>Mask = 0 - SSE packed single and scalar single<br>Mask = 1 - SSE scalar-single<br>Mask = 2 - SSE2 packed-double<br>Mask = 3 - SSE2 scalar-double |   |
| EMON_SSE_SSE2_COMP_INST_RETIRED | D9H        | Computational SSE Instructions Retired:<br>Mask = 0 - SSE packed single<br>Mask = 1 - SSE Scalar-single<br>Mask = 2 - SSE2 packed-double<br>Mask = 3 - SSE2 scalar-double                           |   |
| L2_LD                           | 29H        | L2 data loads   | Mask[0] = 1 - count I state lines<br>Mask[1] = 1 - count S state lines<br>Mask[2] = 1 - count E state lines<br>Mask[3] = 1 - count M state lines<br>Mask[5:4]:<br>00H - Excluding hardware-prefetched lines<br>01H - Hardware-prefetched lines only<br>02H/03H - All (HW-prefetched lines and non HW -- Prefetched lines) |
| L2_LINES_IN                     | 24H        | L2 lines allocated  |   |
| L2_LINES_OUT                    | 26H        | L2 lines evicted  |   |
| L2_M_LINES_OUT                  | 27H        | Lw M-state lines evicted  |   |

## 19.20 P6 FAMILY PROCESSOR PERFORMANCE MONITORING EVENTS

Table 19-40 lists the events that can be counted with the performance monitoring counters and read with the RDPMC instruction for the P6 family processors. The unit column gives the microarchitecture or bus unit that produces the event; the event number column gives the hexadecimal number identifying the event; the mnemonic event name column gives the name of the event; the unit mask column gives the unit mask required (if any); the description column describes the event; and the comments column gives additional information about the event.

All of these performance events are model specific for the P6 family processors and are not available in this form in the Pentium 4 processors or the Pentium processors. Some events (such as those added in later generations of the P6 family processors) are only available in specific processors in the P6 family. All performance event encodings not listed in Table 19-40 are reserved and their use will result in undefined counter results.

See the end of the table for notes related to certain entries in the table.

Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters

| Unit                         | Event Num. | Mnemonic Event Name  | Unit Mask   | Description  | Comments  |
|------------------------------|------------|----------------------|-------------|--|---|
| Data Cache Unit (DCU)        | 43H        | DATA_MEM_REFS        | 00H         | All loads from any memory type. All stores to any memory type. Each part of a split is counted separately. The internal logic counts not only memory loads and stores, but also internal retries.<br><br>80-bit floating-point accesses are double counted, since they are decomposed into a 16-bit exponent load and a 64-bit mantissa load. Memory accesses are only counted when they are actually performed (such as a load that gets squashed because a previous cache miss is outstanding to the same address, and which finally gets performed, is only counted once).<br><br>Does not include I/O accesses, or other nonmemory accesses. |   |
|                              | 45H        | DCU_LINES_IN         | 00H         | Total lines allocated in DCU.  |   |
|                              | 46H        | DCU_M_LINES_IN       | 00H         | Number of M state lines allocated in DCU.  |   |
|                              | 47H        | DCU_M_LINES_OUT      | 00H         | Number of M state lines evicted from DCU. This includes evictions via snoop HITM, intervention or replacement.   |   |
|                              | 48H        | DCU_MISS_OUTSTANDING | 00H         | Weighted number of cycles while a DCU miss is outstanding, incremented by the number of outstanding cache misses at any particular time.<br><br>Cacheable read requests only are considered.<br><br>Uncacheable requests are excluded.<br><br>Read-for-ownerships are counted, as well as line fills, invalidates, and stores.   | An access that also misses the L2 is short-changed by 2 cycles (i.e., if counts N cycles, should be N+2 cycles).<br><br>Subsequent loads to the same cache line will not result in any additional counts.<br><br>Count value not precise, but still useful. |
| Instruction Fetch Unit (IFU) | 80H        | IFU_IFETCH           | 00H         | Number of instruction fetches, both cacheable and noncacheable, including UC fetches.  |   |
|                              | 81H        | IFU_IFETCH_MISS      | 00H         | Number of instruction fetch misses<br>All instruction fetches that do not hit the IFU (i.e., that produce memory requests). This includes UC accesses.   |   |
|                              | 85H        | ITLB_MISS            | 00H         | Number of ITLB misses.   |   |
|                              | 86H        | IFU_MEM_STALL        | 00H         | Number of cycles instruction fetch is stalled, for any reason.<br><br>Includes IFU cache misses, ITLB misses, ITLB faults, and other minor stalls.   |   |
|                              | 87H        | ILD_STALL            | 00H         | Number of cycles that the instruction length decoder is stalled.   |   |
| L2 Cache <sup>1</sup>        | 28H        | L2_IFETCH            | MESI<br>OFH | Number of L2 instruction fetches.<br><br>This event indicates that a normal instruction fetch was received by the L2.  |   |

**Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)**

| Unit                                  | Event Num. | Mnemonic Event Name | Unit Mask               | Description  | Comments  |
|---------------------------------------|------------|---------------------|-------------------------|--|---|
|                                       |            |                     |                         | The count includes only L2 cacheable instruction fetches; it does not include UC instruction fetches.<br>It does not include ITLB miss accesses.   |   |
|                                       | 29H        | L2_LD               | MESI<br>0FH             | Number of L2 data loads.<br>This event indicates that a normal, unlocked, load memory access was received by the L2.<br>It includes only L2 cacheable memory accesses; it does not include I/O accesses, other nonmemory accesses, or memory accesses such as UC/WT memory accesses.<br>It does include L2 cacheable TLB miss memory accesses.   |   |
|                                       | 2AH        | L2_ST               | MESI<br>0FH             | Number of L2 data stores.<br>This event indicates that a normal, unlocked, store memory access was received by the L2.<br>It indicates that the DCU sent a read-for-ownership request to the L2. It also includes Invalid to Modified requests sent by the DCU to the L2.<br>It includes only L2 cacheable memory accesses; it does not include I/O accesses, other nonmemory accesses, or memory accesses such as UC/WT memory accesses.<br>It includes TLB miss memory accesses. |   |
|                                       | 24H        | L2_LINES_IN         | 00H                     | Number of lines allocated in the L2.   |   |
|                                       | 26H        | L2_LINES_OUT        | 00H                     | Number of lines removed from the L2 for any reason.  |   |
|                                       | 25H        | L2_M_LINES_INM      | 00H                     | Number of modified lines allocated in the L2.  |   |
|                                       | 27H        | L2_M_LINES_OUTM     | 00H                     | Number of modified lines removed from the L2 for any reason.   |   |
|                                       | 2EH        | L2_RQSTS            | MESI<br>0FH             | Total number of L2 requests.   |   |
|                                       | 21H        | L2_ADS              | 00H                     | Number of L2 address strobes.  |   |
|                                       | 22H        | L2_DBUS_BUSY        | 00H                     | Number of cycles during which the L2 cache data bus was busy.  |   |
|                                       | 23H        | L2_DBUS_BUSY_RD     | 00H                     | Number of cycles during which the data bus was busy transferring read data from L2 to the processor.   |   |
| External Bus Logic (EBL) <sup>2</sup> | 62H        | BUS_DRDY_CLOCKS     | 00H (Self)<br>20H (Any) | Number of clocks during which DRDY# is asserted.<br>Utilization of the external system data bus during data transfers.   | Unit Mask = 00H counts bus clocks when the processor is driving DRDY#.<br>Unit Mask = 20H counts in processor clocks when any agent is driving DRDY#. |

**Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)**

| Unit | Event Num. | Mnemonic Event Name | Unit Mask               | Description  | Comments   |
|------|------------|---------------------|-------------------------|--|--|
|      | 63H        | BUS_LOCK_CLOCKS     | 00H (Self)<br>20H (Any) | Number of clocks during which LOCK# is asserted on the external system bus. <sup>3</sup>   | Always counts in processor clocks.   |
|      | 60H        | BUS_REQ_OUTSTANDING | 00H (Self)              | Number of bus requests outstanding. This counter is incremented by the number of cacheable read bus requests outstanding in any given cycle. | Counts only DCU full-line cacheable reads, not RFOs, writes, instruction fetches, or anything else. Counts "waiting for bus to complete" (last data chunk received). |
|      | 65H        | BUS_TRAN_BRD        | 00H (Self)<br>20H (Any) | Number of burst read transactions.   |  |
|      | 66H        | BUS_TRAN_RFO        | 00H (Self)<br>20H (Any) | Number of completed read for ownership transactions.   |  |
|      | 67H        | BUS_TRANS_WB        | 00H (Self)<br>20H (Any) | Number of completed write back transactions.   |  |
|      | 68H        | BUS_TRAN_IFETCH     | 00H (Self)<br>20H (Any) | Number of completed instruction fetch transactions.  |  |
|      | 69H        | BUS_TRAN_INVALID    | 00H (Self)<br>20H (Any) | Number of completed invalidate transactions.   |  |
|      | 6AH        | BUS_TRAN_PWR        | 00H (Self)<br>20H (Any) | Number of completed partial write transactions.  |  |
|      | 6BH        | BUS_TRANS_P         | 00H (Self)<br>20H (Any) | Number of completed partial transactions.  |  |
|      | 6CH        | BUS_TRANS_IO        | 00H (Self)<br>20H (Any) | Number of completed I/O transactions.  |  |
|      | 6DH        | BUS_TRAN_DEF        | 00H (Self)<br>20H (Any) | Number of completed deferred transactions.   |  |

**Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)**

| Unit | Event Num. | Mnemonic Event Name | Unit Mask               | Description  | Comments  |
|------|------------|---------------------|-------------------------|--|---|
|      | 6EH        | BUS_TRAN_BURST      | 00H (Self)<br>20H (Any) | Number of completed burst transactions.  |   |
|      | 70H        | BUS_TRAN_ANY        | 00H (Self)<br>20H (Any) | Number of all completed bus transactions.<br>Address bus utilization can be calculated knowing the minimum address bus occupancy.<br>Includes special cycles, etc. |   |
|      | 6FH        | BUS_TRAN_MEM        | 00H (Self)<br>20H (Any) | Number of completed memory transactions.   |   |
|      | 64H        | BUS_DATA_RCV        | 00H (Self)              | Number of bus clock cycles during which this processor is receiving data.  |   |
|      | 61H        | BUS_BNR_DRV         | 00H (Self)              | Number of bus clock cycles during which this processor is driving the BNR# pin.  |   |
|      | 7AH        | BUS_HIT_DRV         | 00H (Self)              | Number of bus clock cycles during which this processor is driving the HIT# pin.  | Includes cycles due to snoop stalls.<br>The event counts correctly, but BPM <sub>i</sub> (breakpoint monitor) pins function as follows based on the setting of the PC bits (bit 19 in the PerfEvtSel0 and PerfEvtSel1 registers): <ul style="list-style-type: none"> <li>▪ If the core-clock-to- bus-clock ratio is 2:1 or 3:1, and a PC bit is set, the BPM<sub>i</sub> pins will be asserted for a single clock when the counters overflow.</li> <li>▪ If the PC bit is clear, the processor toggles the BPM<sub>i</sub> pins when the counter overflows.</li> <li>▪ If the clock ratio is not 2:1 or 3:1, the BPM<sub>i</sub> pins will not function for these performance monitoring counter events.</li> </ul> |
|      | 7BH        | BUS_HITM_DRV        | 00H (Self)              | Number of bus clock cycles during which this processor is driving the HITM# pin.   | Includes cycles due to snoop stalls.<br>The event counts correctly, but BPM <sub>i</sub> (breakpoint monitor) pins function as follows based on the setting of the PC bits (bit 19 in the PerfEvtSel0 and PerfEvtSel1 registers): <ul style="list-style-type: none"> <li>▪ If the core-clock-to- bus-clock ratio is 2:1 or 3:1, and a PC bit is set, the BPM<sub>i</sub> pins will be asserted for a single clock when the counters overflow.</li> </ul>  |

**Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)**

| Unit                | Event Num. | Mnemonic Event Name | Unit Mask  | Description  | Comments   |
|---------------------|------------|---------------------|------------|--|--|
|                     |            |                     |            |  | <ul style="list-style-type: none"> <li>If the PC bit is clear, the processor toggles the BPMipins when the counter overflows.</li> <li>If the clock ratio is not 2:1 or 3:1, the BPMi pins will not function for these performance monitoring counter events.</li> </ul> |
|                     | 7EH        | BUS_SNOOP_STALL     | 00H (Self) | Number of clock cycles during which the bus is snoop stalled.  |  |
| Floating-Point Unit | C1H        | FLOPS               | 00H        | Number of computational floating-point operations retired.<br>Excludes floating-point computational operations that cause traps or assists.<br>Includes floating-point computational operations executed by the assist handler.<br>Includes internal sub-operations for complex floating-point instructions like transcendental.<br>Excludes floating-point loads and stores.              | Counter 0 only.  |
|                     | 10H        | FP_COMP_OPS_EXE     | 00H        | Number of computational floating-point operations executed.<br>The number of FADD, FSUB, FCOM, FMULs, integer MULs and IMULs, FDIVs, FPREMs, FSQRTS, integer DIVs, and IDIVs.<br>This number does not include the number of cycles, but the number of operations.<br>This event does not distinguish an FADD used in the middle of a transcendental flow from a separate FADD instruction. | Counter 0 only.  |
|                     | 11H        | FP_ASSIST           | 00H        | Number of floating-point exception cases handled by microcode.   | Counter 1 only.<br>This event includes counts due to speculative execution.  |
|                     | 12H        | MUL                 | 00H        | Number of multiplies.<br>This count includes integer as well as FP multiplies and is speculative.  | Counter 1 only.  |
|                     | 13H        | DIV                 | 00H        | Number of divides.<br>This count includes integer as well as FP divides and is speculative.  | Counter 1 only.  |
|                     | 14H        | CYCLES_DIV_BUSY     | 00H        | Number of cycles during which the divider is busy, and cannot accept new divides.<br>This includes integer and FP divides, FPREM, FPSQRT, etc. and is speculative.   | Counter 0 only.  |

**Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)**

| Unit                                | Event Num. | Mnemonic Event Name      | Unit Mask                | Description   | Comments   |
|-------------------------------------|------------|--------------------------|--------------------------|---|--|
| Memory Ordering                     | 03H        | LD_BLOCKS                | 00H                      | Number of load operations delayed due to store buffer blocks.<br><br>Includes counts caused by preceding stores whose addresses are unknown, preceding stores whose addresses are known but whose data is unknown, and preceding stores that conflicts with the load but which incompletely overlap the load.   |  |
|                                     | 04H        | SB_DRAINS                | 00H                      | Number of store buffer drain cycles.<br><br>Incremented every cycle the store buffer is draining.<br><br>Draining is caused by serializing operations like CPUID, synchronizing operations like XCHG, interrupt acknowledgment, as well as other conditions (such as cache flushing).   |  |
|                                     | 05H        | MISALIGN_MEM_REF         | 00H                      | Number of misaligned data memory references.<br><br>Incremented by 1 every cycle, during which either the processor's load or store pipeline dispatches a misaligned $\mu$ op.<br><br>Counting is performed if it is the first or second half, or if it is blocked, squashed, or missed.<br><br>In this context, misaligned means crossing a 64-bit boundary. | MISALIGN_MEM_REF is only an approximation to the true number of misaligned memory references.<br><br>The value returned is roughly proportional to the number of misaligned memory accesses (the size of the problem). |
|                                     | 07H        | EMON_KNI_PREF_DISPATCHED | 00H<br>01H<br>02H<br>03H | Number of Streaming SIMD extensions prefetch/weakly-ordered instructions dispatched (speculative prefetches are included in counting):<br><br>0: prefetch NTA<br>1: prefetch T1<br>2: prefetch T2<br>3: weakly ordered stores   | Counters 0 and 1. Pentium III processor only.  |
|                                     | 4BH        | EMON_KNI_PREF_MISS       | 00H<br>01H<br>02H<br>03H | Number of prefetch/weakly-ordered instructions that miss all caches:<br><br>0: prefetch NTA<br>1: prefetch T1<br>2: prefetch T2<br>3: weakly ordered stores   | Counters 0 and 1. Pentium III processor only.  |
| Instruction Decoding and Retirement | COH        | INST_RETIRED             | 00H                      | Number of instructions retired.   | A hardware interrupt received during/after the last iteration of the REP STOS flow causes the counter to undercount by 1 instruction.  |
|                                     |            |                          |                          |   | An SMI received while executing a HLT instruction will cause the performance counter to not count the RSM instruction and undercount by 1.   |

**Table 19-40. Events That Can Be Counted with the P6 Family Performance Monitoring Counters (Contd.)**

| Unit       | Event Num. | Mnemonic Event Name           | Unit Mask  | Description  | Comments                                      |
|------------|------------|-------------------------------|------------|--|---|
|            | C2H        | UOPS_RETIRED                  | 00H        | Number of $\mu$ ops retired.   |   |
|            | D0H        | INST_DECODED                  | 00H        | Number of instructions decoded.  |   |

|      | D5H        | SEG_REG_RENAMES     | 01H<br>02H<br>04H<br>08H<br>0FH<br>Segment registers<br>ES + DS + FS + GS | Number of Segment Register Renames:<br><br>Segment register ES<br>Segment register DS<br>Segment register FS<br>Segment register FS<br>Segment registers<br>ES + DS + FS + GS | Available in Pentium II and Pentium III processors only. |
|      | D6H        | RET_SEG_RENAMES     | 00H   | Number of segment register rename events retired.   | Available in Pentium II and Pentium III processors only. |

**NOTES:**

- Several L2 cache events, where noted, can be further qualified using the Unit Mask (UMSK) field in the PerfEvtSel0 and PerfEvtSel1 registers. The lower 4 bits of the Unit Mask field are used in conjunction with L2 events to indicate the cache state or cache states involved.  
The P6 family processors identify cache states using the “MESI” protocol and consequently each bit in the Unit Mask field represents one of the four states: UMSK[3] = M (8H) state, UMSK[2] = E (4H) state, UMSK[1] = S (2H) state, and UMSK[0] = I (1H) state. UMSK[3:0] = MESI (FH) should be used to collect data for all states; UMSK = 0H, for the applicable events, will result in nothing being counted.
- All of the external bus logic (EBL) events, except where noted, can be further qualified using the Unit Mask (UMSK) field in the PerfEvtSel0 and PerfEvtSel1 registers.  
Bit 5 of the UMSK field is used in conjunction with the EBL events to indicate whether the processor should count transactions that are self-generated (UMSK[5] = 0) or transactions that result from any processor on the bus (UMSK[5] = 1).
- L2 cache locks, so it is possible to have a zero count.

## 19.21 PENTIUM PROCESSOR PERFORMANCE MONITORING EVENTS

Table 19-41 lists the events that can be counted with the performance monitoring counters for the Pentium processor. The Event Number column gives the hexadecimal code that identifies the event and that is entered in the ES0 or ES1 (event select) fields of the CESR MSR. The Mnemonic Event Name column gives the name of the event, and the Description and Comments columns give detailed descriptions of the events. Most events can be counted with either counter 0 or counter 1; however, some events can only be counted with only counter 0 or only counter 1 (as noted).

**NOTE**

The events in the table that are shaded are implemented only in the Pentium processor with MMX technology.

**Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters**

| Event Num. | Mnemonic Event Name                      | Description   | Comments  |
|------------|--|---|---|
| 00H        | DATA_READ                                | Number of memory data reads (internal data cache hit and miss combined).  | Split cycle reads are counted individually. Data Memory Reads that are part of TLB miss processing are not included. These events may occur at a maximum of two per clock. I/O is not included.   |
| 01H        | DATA_WRITE                               | Number of memory data writes (internal data cache hit and miss combined); I/O not included.                               | Split cycle writes are counted individually. These events may occur at a maximum of two per clock. I/O is not included.   |
| 0H2        | DATA_TLB_MISS                            | Number of misses to the data cache translation look-aside buffer.   |   |
| 03H        | DATA_READ_MISS                           | Number of memory read accesses that miss the internal data cache whether or not the access is cacheable or noncacheable.  | Additional reads to the same cache line after the first BRDY# of the burst line fill is returned but before the final (fourth) BRDY# has been returned, will not cause the counter to be incremented additional times.<br>Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included. |
| 04H        | DATA WRITE MISS                          | Number of memory write accesses that miss the internal data cache whether or not the access is cacheable or noncacheable. | Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included.   |
| 05H        | WRITE_HIT_TO_M-OR_E-STATE_LINES          | Number of write hits to exclusive or modified lines in the data cache.  | These are the writes that may be held up if EWBE# is inactive. These events may occur a maximum of two per clock.   |
| 06H        | DATA_CACHE_LINES_WRITTEN_BACK            | Number of dirty lines (all) that are written back, regardless of the cause.   | Replacements and internal and external snoops can all cause writeback and are counted.  |
| 07H        | EXTERNAL_SNOOPS                          | Number of accepted external snoops whether they hit in the code cache or data cache or neither.                           | Assertions of EADS# outside of the sampling interval are not counted, and no internal snoops are counted.   |
| 08H        | EXTERNAL_DATA_CACHE_SNOOP_HITS           | Number of external snoops to the data cache.  | Snoop hits to a valid line in either the data cache, the data line fill buffer, or one of the write back buffers are all counted as hits.   |
| 09H        | MEMORY ACCESSES IN BOTH PIPES            | Number of data memory reads or writes that are paired in both pipes of the pipeline.                                      | These accesses are not necessarily run in parallel due to cache misses, bank conflicts, etc.  |
| 0AH        | BANK CONFLICTS                           | Number of actual bank conflicts.  |   |
| 0BH        | MISALIGNED DATA MEMORY OR I/O REFERENCES | Number of memory or I/O reads or writes that are misaligned.  | A 2- or 4-byte access is misaligned when it crosses a 4-byte boundary; an 8-byte access is misaligned when it crosses an 8-byte boundary. Ten byte accesses are treated as two separate accesses of 8 and 2 bytes each.   |
| 0CH        | CODE READ                                | Number of instruction reads; whether the read is cacheable or noncacheable.   | Individual 8-byte noncacheable instruction reads are counted.   |
| 0DH        | CODE TLB MISS                            | Number of instruction reads that miss the code TLB whether the read is cacheable or noncacheable.                         | Individual 8-byte noncacheable instruction reads are counted.   |
| 0EH        | CODE CACHE MISS                          | Number of instruction reads that miss the internal code cache; whether the read is cacheable or noncacheable.             | Individual 8-byte noncacheable instruction reads are counted.   |

**Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)**

| Event Num. | Mnemonic Event Name              | Description  | Comments   |
|------------|----------------------------------|--|--|
| 0FH        | ANY SEGMENT REGISTER LOADED      | Number of writes into any segment register in real or protected mode including the LDTR, GDTR, IDTR, and TR.   | Segment loads are caused by explicit segment register load instructions, far control transfers, and task switches. Far control transfers and task switches causing a privilege level change will signal this event twice. Interrupts and exceptions may initiate a far control transfer.   |
| 10H        | Reserved                         |  |  |
| 11H        | Reserved                         |  |  |
| 12H        | Branches                         | Number of taken and not taken branches, including: conditional branches, jumps, calls, returns, software interrupts, and interrupt returns.                                      | Also counted as taken branches are serializing instructions, VERR and VERW instructions, some segment descriptor loads, hardware interrupts (including FLUSH#), and programmatic exceptions that invoke a trap or fault handler. The pipe is not necessarily flushed.<br>The number of branches actually executed is measured, not the number of predicted branches.   |
| 13H        | BTB_HITS                         | Number of BTB hits that occur.   | Hits are counted only for those instructions that are actually executed.   |
| 14H        | TAKEN_BRANCH_OR_BTBT_HIT         | Number of taken branches or BTB hits that occur.   | This event type is a logical OR of taken branches and BTB hits. It represents an event that may cause a hit in the BTB. Specifically, it is either a candidate for a space in the BTB or it is already in the BTB.   |
| 15H        | PIPELINE FLUSHES                 | Number of pipeline flushes that occur<br>Pipeline flushes are caused by BTB misses on taken branches, mispredictions, exceptions, interrupts, and some segment descriptor loads. | The counter will not be incremented for serializing instructions (serializing instructions cause the prefetch queue to be flushed but will not trigger the Pipeline Flushed event counter) and software interrupts (software interrupts do not flush the pipeline).  |
| 16H        | INSTRUCTIONS_EXECUTED            | Number of instructions executed (up to two per clock).   | Invocations of a fault handler are considered instructions. All hardware and software interrupts and exceptions will also cause the count to be incremented. Repeat prefixed string instructions will only increment this counter once despite the fact that the repeat loop executes the same instruction multiple times until the loop criteria is satisfied.<br>This applies to all the Repeat string instruction prefixes (i.e., REP, REPE, REPZ, REPNE, and REPNZ). This counter will also only increment once per each HLT instruction executed regardless of how many cycles the processor remains in the HALT state. |
| 17H        | INSTRUCTIONS_EXECUTED_V PIPE     | Number of instructions executed in the V_pipe.<br>The event indicates the number of instructions that were paired.   | This event is the same as the 16H event except it only counts the number of instructions actually executed in the V-pipe.  |
| 18H        | BUS_CYCLE_DURATION               | Number of clocks while a bus cycle is in progress.<br>This event measures bus use.   | The count includes HLDA, AHOLD, and BOFF# clocks.  |
| 19H        | WRITE_BUFFER_FULL_STALL_DURATION | Number of clocks while the pipeline is stalled due to full write buffers.  | Full write buffers stall data memory read misses, data memory write misses, and data memory write hits to S-state lines. Stalls on I/O accesses are not included.  |

**Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)**

| Event Num. | Mnemonic Event Name                         | Description   | Comments  |
|------------|---|---|---|
| 1AH        | WAITING_FOR_DATA_MEMORY_READ_STALL_DURATION | Number of clocks while the pipeline is stalled while waiting for data memory reads.   | Data TLB Miss processing is also included in the count. The pipeline stalls while a data memory read is in progress including attempts to read that are not bypassed while a line is being filled.  |
| 1BH        | STALL ON WRITE TO AN E- OR M-STATE LINE     | Number of stalls on writes to E- or M-state lines.  |   |
| 1CH        | LOCKED BUS CYCLE                            | Number of locked bus cycles that occur as the result of the LOCK prefix or LOCK instruction, page-table updates, and descriptor table updates.                            | Only the read portion of the locked read-modify-write is counted. Split locked cycles (SCYC active) count as two separate accesses. Cycles restarted due to BOFF# are not re-counted.   |
| 1DH        | I/O READ OR WRITE CYCLE                     | Number of bus cycles directed to I/O space.   | Misaligned I/O accesses will generate two bus cycles. Bus cycles restarted due to BOFF# are not re-counted.   |
| 1EH        | NONCACHEABLE_MEMORY_READS                   | Number of noncacheable instruction or data memory read bus cycles.<br>The count includes read cycles caused by TLB misses, but does not include read cycles to I/O space. | Cycles restarted due to BOFF# are not re-counted.   |
| 1FH        | PIPELINE_AGI_STALLS                         | Number of address generation interlock (AGI) stalls.<br>An AGI occurring in both the U- and V-pipelines in the same clock signals this event twice.                       | An AGI occurs when the instruction in the execute stage of either of U- or V-pipelines is writing to either the index or base address register of an instruction in the D2 (address generation) stage of either the U- or V- pipelines.   |
| 20H        | Reserved                                    |   |   |
| 21H        | Reserved                                    |   |   |
| 22H        | FLOPS                                       | Number of floating-point operations that occur.   | Number of floating-point adds, subtracts, multiplies, divides, remainders, and square roots are counted. The transcendental instructions consist of multiple adds and multiplies and will signal this event multiple times. Instructions generating the divide-by-zero, negative square root, special operand, or stack exceptions will not be counted.<br><br>Instructions generating all other floating-point exceptions will be counted. The integer multiply instructions and other instructions which use the x87 FPU will be counted.       |
| 23H        | BREAKPOINT MATCH ON DRO REGISTER            | Number of matches on register DRO breakpoint.   | The counters is incremented regardless if the breakpoints are enabled or not. However, if breakpoints are not enabled, code breakpoint matches will not be checked for instructions executed in the V-pipe and will not cause this counter to be incremented. (They are checked on instruction executed in the U-pipe only when breakpoints are not enabled.)<br><br>These events correspond to the signals driven on the BP[3:0] pins. Refer to Chapter 17, "Debug, Branch Profile, TSC, and Resource Monitoring Features" for more information. |
| 24H        | BREAKPOINT MATCH ON DR1 REGISTER            | Number of matches on register DR1 breakpoint.   | See comment for 23H event.  |

**Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)**

| Event Num. | Mnemonic Event Name                          | Description  | Comments  |
|------------|--|--|---|
| 25H        | BREAKPOINT MATCH ON DR2 REGISTER             | Number of matches on register DR2 breakpoint.  | See comment for 23H event.  |
| 26H        | BREAKPOINT MATCH ON DR3 REGISTER             | Number of matches on register DR3 breakpoint.  | See comment for 23H event.  |
| 27H        | HARDWARE INTERRUPTS                          | Number of taken INTR and NMI interrupts.   |   |
| 28H        | DATA_READ_OR_WRITE                           | Number of memory data reads and/or writes (internal data cache hit and miss combined).   | Split cycle reads and writes are counted individually. Data Memory Reads that are part of TLB miss processing are not included. These events may occur at a maximum of two per clock. I/O is not included.  |
| 29H        | DATA_READ_MISS OR_WRITE MISS                 | Number of memory read and/or write accesses that miss the internal data cache, whether or not the access is cacheable or noncacheable.                               | Additional reads to the same cache line after the first BRDY# of the burst line fill is returned but before the final (fourth) BRDY# has been returned, will not cause the counter to be incremented additional times.<br>Data accesses that are part of TLB miss processing are not included. Accesses directed to I/O space are not included. |
| 2AH        | BUS_OWNERSHIP_LATENCY (Counter 0)            | The time from LRM bus ownership request to bus ownership granted (that is, the time from the earlier of a PBREQ (0), PHITM# or HITM# assertion to a PBGNT assertion) | The ratio of the 2AH events counted on counter 0 and counter 1 is the average stall time due to bus ownership conflict.   |
| 2AH        | BUS OWNERSHIP TRANSFERS (Counter 1)          | The number of bus ownership transfers (that is, the number of PBREQ (0) assertions)  | The ratio of the 2AH events counted on counter 0 and counter 1 is the average stall time due to bus ownership conflict.   |
| 2BH        | MMX_INSTRUCTIONS_EXECUTED_U-PIPE (Counter 0) | Number of MMX instructions executed in the U-pipe  |   |
| 2BH        | MMX_INSTRUCTIONS_EXECUTED_V-PIPE (Counter 1) | Number of MMX instructions executed in the V-pipe  |   |
| 2CH        | CACHE_M-STATE_LINE_SHARING (Counter 0)       | Number of times a processor identified a hit to a modified line due to a memory access in the other processor (PHITM (0))  | If the average memory latencies of the system are known, this event enables the user to count the Write Backs on PHITM(0) penalty and the Latency on Hit Modified(I) penalty.   |
| 2CH        | CACHE_LINE_SHARING (Counter 1)               | Number of shared data lines in the L1 cache (PHIT (0))   |   |
| 2DH        | EMMS_INSTRUCTIONS_EXECUTED (Counter 0)       | Number of EMMS instructions executed   |   |

**Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)**

| Event Num. | Mnemonic Event Name  | Description   | Comments   |
|------------|--|---|--|
| 2DH        | TRANSITIONS_BETWEEN_MMX_AND_FP_INSTRUCTIONS<br>(Counter 1) | Number of transitions between MMX and floating-point instructions or vice versa<br><br>An even count indicates the processor is in MMX state. an odd count indicates it is in FP state. | This event counts the first floating-point instruction following an MMX instruction or first MMX instruction following a floating-point instruction.<br><br>The count may be used to estimate the penalty in transitions between floating-point state and MMX state.   |
| 2EH        | BUS_UTILIZATION_DUE_TO_PROCESSOR_ACTIVITY<br>(Counter 0)   | Number of clocks the bus is busy due to the processor's own activity (the bus activity that is caused by the processor)   |  |
| 2EH        | WRITES_TO_NONCACHEABLE_MEMORY<br>(Counter 1)               | Number of write accesses to noncacheable memory   | The count includes write cycles caused by TLB misses and I/O write cycles.<br><br>Cycles restarted due to BOFF# are not re-counted.  |
| 2FH        | SATURATING_MMX_INSTRUCTIONS_EXECUTED<br>(Counter 0)        | Number of saturating MMX instructions executed, independently of whether they actually saturated.   |  |
| 2FH        | SATURATIONS_PERFORMED<br>(Counter 1)                       | Number of MMX instructions that used saturating arithmetic when at least one of its results actually saturated  | If an MMX instruction operating on 4 doublewords saturated in three out of the four results, the counter will be incremented by one only.  |
| 30H        | NUMBER_OF_CYCLES_NOT_IN_HALT_STATE<br>(Counter 0)          | Number of cycles the processor is not idle due to HLT instruction   | This event will enable the user to calculate "net CPI". Note that during the time that the processor is executing the HLT instruction, the Time-Stamp Counter is not disabled. Since this event is controlled by the Counter Controls CCO, CC1 it can be used to calculate the CPI at CPL=3, which the TSC cannot provide. |
| 30H        | DATA_CACHE_TLB_MISS_STALL_DURATION<br>(Counter 1)          | Number of clocks the pipeline is stalled due to a data cache translation look-aside buffer (TLB) miss   |  |
| 31H        | MMX_INSTRUCTION_DATA_READS<br>(Counter 0)                  | Number of MMX instruction data reads  |  |
| 31H        | MMX_INSTRUCTION_DATA_READ_MISSES<br>(Counter 1)            | Number of MMX instruction data read misses  |  |
| 32H        | FLOATING_POINT_STALLS_DURATION<br>(Counter 0)              | Number of clocks while pipe is stalled due to a floating-point freeze   |  |
| 32H        | TAKEN_BRANCHES<br>(Counter 1)                              | Number of taken branches  |  |

**Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)**

| Event Num. | Mnemonic Event Name  | Description   | Comments   |
|------------|--|---|--|
| 33H        | D1_STARVATION_<br>AND_FIFO_IS_<br>EMPTY<br>(Counter 0)   | Number of times D1 stage cannot issue ANY instructions since the FIFO buffer is empty                           | The D1 stage can issue 0, 1, or 2 instructions per clock if those are available in an instructions FIFO buffer.  |
| 33H        | D1_STARVATION_<br>AND_ONLY_ONE_<br>INSTRUCTION_IN_<br>FIFO<br>(Counter 1)                                    | Number of times the D1 stage issues a single instruction (since the FIFO buffer had just one instruction ready) | The D1 stage can issue 0, 1, or 2 instructions per clock if those are available in an instructions FIFO buffer.<br><br>When combined with the previously defined events, Instruction Executed (16H) and Instruction Executed in the V-pipe (17H), this event enables the user to calculate the numbers of time pairing rules prevented issuing of two instructions.  |
| 34H        | MMX_<br>INSTRUCTION_<br>DATA_WRITES<br>(Counter 0)   | Number of data writes caused by MMX instructions  |  |
| 34H        | MMX_<br>INSTRUCTION_<br>DATA_WRITE_<br>MISSES<br>(Counter 1)   | Number of data write misses caused by MMX instructions  |  |
| 35H        | PIPELINE_<br>FLUSHES_DUE_<br>TO_WRONG_<br>BRANCH_<br>PREDICTIONS<br>(Counter 0)                              | Number of pipeline flushes due to wrong branch predictions resolved in either the E-stage or the WB-stage       | The count includes any pipeline flush due to a branch that the pipeline did not follow correctly. It includes cases where a branch was not in the BTB, cases where a branch was in the BTB but was mispredicted, and cases where a branch was correctly predicted but to the wrong address.<br><br>Branches are resolved in either the Execute stage (E-stage) or the Writeback stage (WB-stage). In the later case, the misprediction penalty is larger by one clock. The difference between the 35H event count in counter 0 and counter 1 is the number of E-stage resolved branches. |
| 35H        | PIPELINE_<br>FLUSHES_DUE_<br>TO_WRONG_<br>BRANCH_<br>PREDICTIONS_<br>RESOLVED_IN_<br>WB-STAGE<br>(Counter 1) | Number of pipeline flushes due to wrong branch predictions resolved in the WB-stage                             | See note for event 35H (Counter 0).  |
| 36H        | MISALIGNED_<br>DATA_MEMORY_<br>REFERENCE_ON_<br>MMX_<br>INSTRUCTIONS<br>(Counter 0)                          | Number of misaligned data memory references when executing MMX instructions                                     |  |
| 36H        | PIPELINE_<br>ISTALL_FOR_MMX_<br>INSTRUCTION_<br>DATA_MEMORY_<br>READS<br>(Counter 1)                         | Number clocks during pipeline stalls caused by waits form MMX instruction data memory reads                     | T3:  |

**Table 19-41. Events That Can Be Counted with Pentium Processor Performance Monitoring Counters (Contd.)**

| Event Num. | Mnemonic Event Name  | Description   | Comments  |
|------------|--|---|---|
| 37H        | MISPREDICTED_<br>OR_<br>UNPREDICTED_<br>RETURNS<br>(Counter 1)                                       | Number of returns predicted incorrectly or not predicted at all   | The count is the difference between the total number of executed returns and the number of returns that were correctly predicted. Only RET instructions are counted (for example, IRET instructions are not counted).   |
| 37H        | PREDICTED_<br>RETURNS<br>(Counter 1)   | Number of predicted returns (whether they are predicted correctly and incorrectly)  | Only RET instructions are counted (for example, IRET instructions are not counted).   |
| 38H        | MMX_MULTIPLY_<br>UNIT_INTERLOCK<br>(Counter 0)   | Number of clocks the pipe is stalled since the destination of previous MMX multiply instruction is not ready yet  | The counter will not be incremented if there is another cause for a stall. For each occurrence of a multiply interlock, this event will be counted twice (if the stalled instruction comes on the next clock after the multiply) or by once (if the stalled instruction comes two clocks after the multiply). |
| 38H        | MOVD/MOVQ_<br>STORE_STALL_<br>DUE_TO_<br>PREVIOUS_MMX_<br>OPERATION<br>(Counter 1)                   | Number of clocks a MOVD/MOVQ instruction store is stalled in D2 stage due to a previous MMX operation with a destination to be used in the store instruction. |   |
| 39H        | RETURNS<br>(Counter 0)   | Number of returns executed.   | Only RET instructions are counted; IRET instructions are not counted. Any exception taken on a RET instruction and any interrupt recognized by the processor on the instruction boundary prior to the execution of the RET instruction will also cause this counter to be incremented.                        |
| 39H        | Reserved   |   |   |
| 3AH        | BTB_FALSE_<br>ENTRIES<br>(Counter 0)   | Number of false entries in the Branch Target Buffer   | False entries are causes for misprediction other than a wrong prediction.   |
| 3AH        | BTB_MISS_<br>PREDICTION_ON_<br>NOT-TAKEN_<br>BRANCH<br>(Counter 1)                                   | Number of times the BTB predicted a not-taken branch as taken   |   |
| 3BH        | FULL_WRITE_<br>BUFFER_STALL_<br>DURATION_<br>WHILE_<br>EXECUTING_MMX_I<br>NSTRUCTIONS<br>(Counter 0) | Number of clocks while the pipeline is stalled due to full write buffers while executing MMX instructions   |   |
| 3BH        | STALL_ON_MMX_<br>INSTRUCTION_<br>WRITE_TO_E-_OR_<br>M-STATE_LINE<br>(Counter 1)                      | Number of clocks during stalls on MMX instructions writing to E- or M-state lines   |   |

## 20. Updates to Chapter 24, Volume 3B

Change bars show changes to Chapter 24 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B: System Programming Guide, Part 2*.

-----  
Changes to this chapter: Various updates related to VMX and Intel Processor Trace interactions.

### 24.1 OVERVIEW

A logical processor uses **virtual-machine control data structures (VMCSs)** while it is in VMX operation. These manage transitions into and out of VMX non-root operation (VM entries and VM exits) as well as processor behavior in VMX non-root operation. This structure is manipulated by the new instructions VMCLEAR, VMPTRLD, VMREAD, and VMWRITE.

A VMM can use a different VMCS for each virtual machine that it supports. For a virtual machine with multiple logical processors (virtual processors), the VMM can use a different VMCS for each virtual processor.

A logical processor associates a region in memory with each VMCS. This region is called the **VMCS region**.<sup>1</sup> Software references a specific VMCS using the 64-bit physical address of the region (a **VMCS pointer**). VMCS pointers must be aligned on a 4-KByte boundary (bits 11:0 must be zero). These pointers must not set bits beyond the processor's physical-address width.<sup>2,3</sup>

A logical processor may maintain a number of VMCSs that are **active**. The processor may optimize VMX operation by maintaining the state of an active VMCS in memory, on the processor, or both. At any given time, at most one of the active VMCSs is the **current VMCS**. (This document frequently uses the term "the VMCS" to refer to the current VMCS.) The VMLAUNCH, VMREAD, VMRESUME, and VMWRITE instructions operate only on the current VMCS.

The following items describe how a logical processor determines which VMCSs are active and which is current:

- The memory operand of the VMPTRLD instruction is the address of a VMCS. After execution of the instruction, that VMCS is both active and current on the logical processor. Any other VMCS that had been active remains so, but no other VMCS is current.
- The VMCS link pointer field in the current VMCS (see Section 24.4.2) is itself the address of a VMCS. If VM entry is performed successfully with the 1-setting of the "VMCS shadowing" VM-execution control, the VMCS referenced by the VMCS link pointer field becomes active on the logical processor. The identity of the current VMCS does not change.
- The memory operand of the VMCLEAR instruction is also the address of a VMCS. After execution of the instruction, that VMCS is neither active nor current on the logical processor. If the VMCS had been current on the logical processor, the logical processor no longer has a current VMCS.

The VMPTRST instruction stores the address of the logical processor's current VMCS into a specified memory location (it stores the value FFFFFFFF\_FFFFFFFFH if there is no current VMCS).

The **launch state** of a VMCS determines which VM-entry instruction should be used with that VMCS: the VMLAUNCH instruction requires a VMCS whose launch state is "clear"; the VMRESUME instruction requires a VMCS whose launch state is "launched". A logical processor maintains a VMCS's launch state in the corresponding VMCS region. The following items describe how a logical processor manages the launch state of a VMCS:

- If the launch state of the current VMCS is "clear", successful execution of the VMLAUNCH instruction changes the launch state to "launched".
- The memory operand of the VMCLEAR instruction is the address of a VMCS. After execution of the instruction, the launch state of that VMCS is "clear".
- There are no other ways to modify the launch state of a VMCS (it cannot be modified using VMWRITE) and there is no direct way to discover it (it cannot be read using VMREAD).

---

1. The amount of memory required for a VMCS region is at most 4 KBytes. The exact size is implementation specific and can be determined by consulting the VMX capability MSR IA32\_VMX\_BASIC to determine the size of the VMCS region (see Appendix A.1).

2. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

3. If IA32\_VMX\_BASIC[48] is read as 1, these pointers must not set any bits in the range 63:32; see Appendix A.1.

Figure 24-1 illustrates the different states of a VMCS. It uses “X” to refer to the VMCS and “Y” to refer to any other VMCS. Thus: “VMPTRLD X” always makes X current and active; “VMPTRLD Y” always makes X not current (because it makes Y current); VMLAUNCH makes the launch state of X “launched” if X was current and its launch state was “clear”; and VMCLEAR X always makes X inactive and not current and makes its launch state “clear”.

The figure does not illustrate operations that do not modify the VMCS state relative to these parameters (e.g., execution of VMPTRLD X when X is already current). Note that VMCLEAR X makes X “inactive, not current, and clear,” even if X’s current state is not defined (e.g., even if X has not yet been initialized). See Section 24.11.3.

Figure 24-1. States of VMCS X

Because a shadow VMCS (see Section 24.10) cannot be used for VM entry, the launch state of a shadow VMCS is not meaningful. Figure 24-1 does not illustrate all the ways in which a shadow VMCS may be made active.

24.2    FORMAT OF THE VMCS REGION

A VMCS region comprises up to 4-KBytes.<sup>1</sup> The format of a VMCS region is given in Table 24-1.

Table 24-1. Format of the VMCS Region

| Byte Offset | Contents   |
|-------------|--|
| 0           | Bits 30:0: VMCS revision identifier<br>Bit 31: shadow-VMCS indicator (see Section 24.10) |
| 4           | VMX-abort indicator  |
| 8           | VMCS data (implementation-specific format)   |

The first 4 bytes of the VMCS region contain the **VMCS revision identifier** at bits 30:0.<sup>2</sup> Processors that maintain VMCS data in different formats (see below) use different VMCS revision identifiers. These identifiers enable soft-

1. The exact size is implementation specific and can be determined by consulting the VMX capability MSR IA32\_VMX\_BASIC to determine the size of the VMCS region (see Appendix A.1).

ware to avoid using a VMCS region formatted for one processor on a processor that uses a different format.<sup>1</sup> Bit 31 of this 4-byte region indicates whether the VMCS is a shadow VMCS (see Section 24.10).

Software should write the VMCS revision identifier to the VMCS region before using that region for a VMCS. The VMCS revision identifier is never written by the processor; VMPTRLD fails if its operand references a VMCS region whose VMCS revision identifier differs from that used by the processor. (VMPTRLD also fails if the shadow-VMCS indicator is 1 and the processor does not support the 1-setting of the “VMCS shadowing” VM-execution control; see Section 24.6.2) Software can discover the VMCS revision identifier that a processor uses by reading the VMX capability MSR IA32\_VMX\_BASIC (see Appendix A.1).

Software should clear or set the shadow-VMCS indicator depending on whether the VMCS is to be an ordinary VMCS or a shadow VMCS (see Section 24.10). VMPTRLD fails if the shadow-VMCS indicator is set and the processor does not support the 1-setting of the “VMCS shadowing” VM-execution control. Software can discover support for this setting by reading the VMX capability MSR IA32\_VMX\_PROCBASED\_CTLS2 (see Appendix A.3.3).

The next 4 bytes of the VMCS region are used for the **VMX-abort indicator**. The contents of these bits do not control processor operation in any way. A logical processor writes a non-zero value into these bits if a VMX abort occurs (see Section 27.7). Software may also write into this field.

The remainder of the VMCS region is used for **VMCS data** (those parts of the VMCS that control VMX non-root operation and the VMX transitions). The format of these data is implementation-specific. VMCS data are discussed in Section 24.3 through Section 24.9. To ensure proper behavior in VMX operation, software should maintain the VMCS region and related structures (enumerated in Section 24.11.4) in writeback cacheable memory. Future implementations may allow or require a different memory type<sup>2</sup>. Software should consult the VMX capability MSR IA32\_VMX\_BASIC (see Appendix A.1).

## 24.3 ORGANIZATION OF VMCS DATA

The VMCS data are organized into six logical groups:

- **Guest-state area.** Processor state is saved into the guest-state area on VM exits and loaded from there on VM entries.
- **Host-state area.** Processor state is loaded from the host-state area on VM exits.
- **VM-execution control fields.** These fields control processor behavior in VMX non-root operation. They determine in part the causes of VM exits.
- **VM-exit control fields.** These fields control VM exits.
- **VM-entry control fields.** These fields control VM entries.
- **VM-exit information fields.** These fields receive information on VM exits and describe the cause and the nature of VM exits. On some processors, these fields are read-only.<sup>3</sup>

The VM-execution control fields, the VM-exit control fields, and the VM-entry control fields are sometimes referred to collectively as VMX controls.

---

2. Earlier versions of this manual specified that the VMCS revision identifier was a 32-bit field. For all processors produced prior to this change, bit 31 of the VMCS revision identifier was 0.

1. Logical processors that use the same VMCS revision identifier use the same size for VMCS regions.

2. Alternatively, software may map any of these regions or structures with the UC memory type. Doing so is strongly discouraged unless necessary as it will cause the performance of transitions using those structures to suffer significantly. In addition, the processor will continue to use the memory type reported in the VMX capability MSR IA32\_VMX\_BASIC with exceptions noted in Appendix A.1.

3. Software can discover whether these fields can be written by reading the VMX capability MSR IA32\_VMX\_MISC (see Appendix A.6).

## 24.4 GUEST-STATE AREA

This section describes fields contained in the guest-state area of the VMCS. As noted earlier, processor state is loaded from these fields on every VM entry (see Section 26.3.2) and stored into these fields on every VM exit (see Section 27.3).

### 24.4.1 Guest Register State

The following fields in the guest-state area correspond to processor registers:

- Control registers CR0, CR3, and CR4 (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- Debug register DR7 (64 bits; 32 bits on processors that do not support Intel 64 architecture).
- RSP, RIP, and RFLAGS (64 bits each; 32 bits on processors that do not support Intel 64 architecture).<sup>1</sup>
- The following fields for each of the registers CS, SS, DS, ES, FS, GS, LDTR, and TR:
  - Selector (16 bits).
  - Base address (64 bits; 32 bits on processors that do not support Intel 64 architecture). The base-address fields for CS, SS, DS, and ES have only 32 architecturally-defined bits; nevertheless, the corresponding VMCS fields have 64 bits on processors that support Intel 64 architecture.
  - Segment limit (32 bits). The limit field is always a measure in bytes.
  - Access rights (32 bits). The format of this field is given in Table 24-2 and detailed as follows:
    - The low 16 bits correspond to bits 23:8 of the upper 32 bits of a 64-bit segment descriptor. While bits 19:16 of code-segment and data-segment descriptors correspond to the upper 4 bits of the segment limit, the corresponding bits (bits 11:8) are reserved in this VMCS field.
    - Bit 16 indicates an **unusable segment**. Attempts to use such a segment fault except in 64-bit mode. In general, a segment register is unusable if it has been loaded with a null selector.<sup>2</sup>
    - Bits 31:17 are reserved.

**Table 24-2. Format of Access Rights**

| Bit Position(s) | Field  |
|-----------------|--|
| 3:0             | Segment type                                       |
| 4               | S — Descriptor type (0 = system; 1 = code or data) |
| 6:5             | DPL — Descriptor privilege level                   |
| 7               | P — Segment present                                |
| 11:8            | Reserved   |
| 12              | AVL — Available for use by system software         |

1. This chapter uses the notation RAX, RIP, RSP, RFLAGS, etc. for processor registers because most processors that support VMX operation also support Intel 64 architecture. For processors that do not support Intel 64 architecture, this notation refers to the 32-bit forms of those registers (EAX, EIP, ESP, EFLAGS, etc.). In a few places, notation such as EAX is used to refer specifically to lower 32 bits of the indicated register.
2. There are a few exceptions to this statement. For example, a segment with a non-null selector may be unusable following a task switch that fails after its commit point; see “Interrupt 10—Invalid TSS Exception (#TS)” in Section 6.14, “Exception and Interrupt Handling in 64-bit Mode,” of the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*. In contrast, the TR register is usable after processor reset despite having a null selector; see Table 10-1 in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*.

**Table 24-2. Format of Access Rights (Contd.)**

| Bit Position(s) | Field   |
|-----------------|---|
| 13              | Reserved (except for CS)<br>L — 64-bit mode active (for CS only)      |
| 14              | D/B — Default operation size (0 = 16-bit segment; 1 = 32-bit segment) |
| 15              | G — Granularity   |
| 16              | Segment unusable (0 = usable; 1 = unusable)                           |
| 31:17           | Reserved  |

The base address, segment limit, and access rights compose the “hidden” part (or “descriptor cache”) of each segment register. These data are included in the VMCS because it is possible for a segment register’s descriptor cache to be inconsistent with the segment descriptor in memory (in the GDT or the LDT) referenced by the segment register’s selector.

The value of the DPL field for SS is always equal to the logical processor’s current privilege level (CPL).<sup>1</sup>

- The following fields for each of the registers GDTR and IDTR:
  - Base address (64 bits; 32 bits on processors that do not support Intel 64 architecture).
  - Limit (32 bits). The limit fields contain 32 bits even though these fields are specified as only 16 bits in the architecture.
- The following MSRs:
  - IA32\_DEBUGCTL (64 bits)
  - IA32\_SYSENTER\_CS (32 bits)
  - IA32\_SYSENTER\_ESP and IA32\_SYSENTER\_EIP (64 bits; 32 bits on processors that do not support Intel 64 architecture)
  - IA32\_PERF\_GLOBAL\_CTRL (64 bits). This field is supported only on processors that support the 1-setting of the “load IA32\_PERF\_GLOBAL\_CTRL” VM-entry control.
  - IA32\_PAT (64 bits). This field is supported only on processors that support either the 1-setting of the “load IA32\_PAT” VM-entry control or that of the “save IA32\_PAT” VM-exit control.
  - IA32\_EFER (64 bits). This field is supported only on processors that support either the 1-setting of the “load IA32\_EFER” VM-entry control or that of the “save IA32\_EFER” VM-exit control.
  - IA32\_BNDCFGS (64 bits). This field is supported only on processors that support either the 1-setting of the “load IA32\_BNDCFGS” VM-entry control or that of the “clear IA32\_BNDCFGS” VM-exit control.
- The register SMBASE (32 bits). This register contains the base address of the logical processor’s SMRAM image.

## 24.4.2 Guest Non-Register State

In addition to the register state described in Section 24.4.1, the guest-state area includes the following fields that characterize guest state but which do not correspond to processor registers:

- **Activity state** (32 bits). This field identifies the logical processor’s activity state. When a logical processor is executing instructions normally, it is in the **active state**. Execution of certain instructions and the occurrence of certain events may cause a logical processor to transition to an **inactive state** in which it ceases to execute instructions.

The following activity states are defined:<sup>2</sup>

- 0: **Active**. The logical processor is executing instructions normally.

1. In protected mode, CPL is also associated with the RPL field in the CS selector. However, the RPL fields are not meaningful in real-address mode or in virtual-8086 mode.

- 1: **HLT**. The logical processor is inactive because it executed the HLT instruction.
- 2: **Shutdown**. The logical processor is inactive because it incurred a **triple fault**<sup>1</sup> or some other serious error.
- 3: **Wait-for-SIPI**. The logical processor is inactive because it is waiting for a startup-IPI (SIPI).

Future processors may include support for other activity states. Software should read the VMX capability MSR IA32\_VMX\_MISC (see Appendix A.6) to determine what activity states are supported.

- **Interruptibility state** (32 bits). The IA-32 architecture includes features that permit certain events to be blocked for a period of time. This field contains information about such blocking. Details and the format of this field are given in Table 24-3.

**Table 24-3. Format of Interruptibility State**

| Bit Position(s) | Bit Name             | Notes   |
|-----------------|----------------------|---|
| 0               | Blocking by STI      | See the “STI—Set Interrupt Flag” section in Chapter 4 of the <i>Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B</i> .<br>Execution of STI with RFLAGS.IF = 0 blocks interrupts (and, optionally, other events) for one instruction after its execution. Setting this bit indicates that this blocking is in effect.  |
| 1               | Blocking by MOV SS   | See the “MOV—Move a Value from the Stack” from Chapter 4 of the <i>Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B</i> , and “POP—Pop a Value from the Stack” from Chapter 4 of the <i>Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B</i> , and Section 6.8.3 in the <i>Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A</i> .<br>Execution of a MOV to SS or a POP to SS blocks interrupts for one instruction after its execution. In addition, certain debug exceptions are inhibited between a MOV to SS or a POP to SS and a subsequent instruction. Setting this bit indicates that the blocking of all these events is in effect. This document uses the term “blocking by MOV SS,” but it applies equally to POP SS. |
| 2               | Blocking by SMI      | See Section 34.2. System-management interrupts (SMIs) are disabled while the processor is in system-management mode (SMM). Setting this bit indicates that blocking of SMIs is in effect.   |
| 3               | Blocking by NMI      | See Section 6.7.1 in the <i>Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A</i> and Section 34.8.<br>Delivery of a non-maskable interrupt (NMI) or a system-management interrupt (SMI) blocks subsequent NMIs until the next execution of IRET. See Section 25.3 for how this behavior of IRET may change in VMX non-root operation. Setting this bit indicates that blocking of NMIs is in effect. Clearing this bit does not imply that NMIs are not (temporarily) blocked for other reasons.<br>If the “virtual NMIs” VM-execution control (see Section 24.6.1) is 1, this bit does not control the blocking of NMIs. Instead, it refers to “virtual-NMI blocking” (the fact that guest software is not ready for an NMI).  |
| 4               | Enclave interruption | A VM exit saves this bit as 1 to indicate that the VM exit was incident to enclave mode.  |
| 31:5            | Reserved             | VM entry will fail if these bits are not 0. See Section 26.3.1.5.   |

- **Pending debug exceptions** (64 bits; 32 bits on processors that do not support Intel 64 architecture). IA-32 processors may recognize one or more debug exceptions without immediately delivering them.<sup>2</sup> This field contains information about such exceptions. This field is described in Table 24-4.

2. Execution of the MWAIT instruction may put a logical processor into an inactive state. However, this VMCS field never reflects this state. See Section 27.1.

1. A triple fault occurs when a logical processor encounters an exception while attempting to deliver a double fault.

**Table 24-4. Format of Pending-Debug-Exceptions**

| Bit Position(s) | Bit Name           | Notes  |
|-----------------|--------------------|--|
| 3:0             | B3 – B0            | When set, each of these bits indicates that the corresponding breakpoint condition was met. Any of these bits may be set even if the corresponding enabling bit in DR7 is not set.   |
| 11:4            | Reserved           | VM entry fails if these bits are not 0. See Section 26.3.1.5.  |
| 12              | Enabled breakpoint | When set, this bit indicates that at least one data or I/O breakpoint was met and was enabled in DR7.  |
| 13              | Reserved           | VM entry fails if this bit is not 0. See Section 26.3.1.5.   |
| 14              | BS                 | When set, this bit indicates that a debug exception would have been triggered by single-step execution mode.   |
| 15              | Reserved           | VM entry fails if this bit is not 0. See Section 26.3.1.5.   |
| 16              | RTM                | When set, this bit indicates that a debug exception (#DB) or a breakpoint exception (#BP) occurred inside an RTM region while advanced debugging of RTM transactional regions was enabled (see Section 16.3.7, “RTM-Enabled Debugger Support,” of <i>Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1</i> ). <sup>1</sup> |
| 63:17           | Reserved           | VM entry fails if these bits are not 0. See Section 26.3.1.5. Bits 63:32 exist only on processors that support Intel 64 architecture.  |

**NOTES:**

- In general, the format of this field matches that of DR6. However, DR6 **clears** bit 16 to indicate an RTM-related exception, while this field **sets** the bit to indicate that condition.
- VMCS link pointer** (64 bits). If the “VMCS shadowing” VM-execution control is 1, the VMREAD and VMWRITE instructions access the VMCS referenced by this pointer (see Section 24.10). Otherwise, software should set this field to FFFFFFFF\_FFFFFFFFH to avoid VM-entry failures (see Section 26.3.1.5).
  - VMX-preemption timer value** (32 bits). This field is supported only on processors that support the 1-setting of the “activate VMX-preemption timer” VM-execution control. This field contains the value that the VMX-preemption timer will use following the next VM entry with that setting. See Section 25.5.1 and Section 26.6.4.
  - Page-directory-pointer-table entries** (PDPTEs; 64 bits each). These four (4) fields (PDPTE0, PDPTE1, PDPTE2, and PDPTE3) are supported only on processors that support the 1-setting of the “enable EPT” VM-execution control. They correspond to the PDPTEs referenced by CR3 when PAE paging is in use (see Section 4.4 in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*). They are used only if the “enable EPT” VM-execution control is 1.
  - Guest interrupt status** (16 bits). This field is supported only on processors that support the 1-setting of the “virtual-interrupt delivery” VM-execution control. It characterizes part of the guest’s virtual-APIC state and does not correspond to any processor or APIC registers. It comprises two 8-bit subfields:
    - Requesting virtual interrupt (RVI)**. This is the low byte of the guest interrupt status. The processor treats this value as the vector of the highest priority virtual interrupt that is requesting service. (The value 0 implies that there is no such interrupt.)
    - Servicing virtual interrupt (SVI)**. This is the high byte of the guest interrupt status. The processor treats this value as the vector of the highest priority virtual interrupt that is in service. (The value 0 implies that there is no such interrupt.)
- For example, execution of a MOV to SS or a POP to SS may inhibit some debug exceptions for one instruction. See Section 6.8.3 of *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*. In addition, certain events incident to an instruction (for example, an INIT signal) may take priority over debug traps generated by that instruction. See Table 6-2 in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*.

See Chapter 29 for more information on the use of this field.

- **PML index** (16 bits). This field is supported only on processors that support the 1-setting of the “enable PML” VM-execution control. It contains the logical index of the next entry in the page-modification log. Because the page-modification log comprises 512 entries, the PML index is typically a value in the range 0–511. Details of the page-modification log and use of the PML index are given in Section 28.2.5.

## 24.5 HOST-STATE AREA

This section describes fields contained in the host-state area of the VMCS. As noted earlier, processor state is loaded from these fields on every VM exit (see Section 27.5).

All fields in the host-state area correspond to processor registers:

- CR0, CR3, and CR4 (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- RSP and RIP (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- Selector fields (16 bits each) for the segment registers CS, SS, DS, ES, FS, GS, and TR. There is no field in the host-state area for the LDTR selector.
- Base-address fields for FS, GS, TR, GDTR, and IDTR (64 bits each; 32 bits on processors that do not support Intel 64 architecture).
- The following MSRs:
  - IA32\_SYSENTER\_CS (32 bits)
  - IA32\_SYSENTER\_ESP and IA32\_SYSENTER\_EIP (64 bits; 32 bits on processors that do not support Intel 64 architecture).
  - IA32\_PERF\_GLOBAL\_CTRL (64 bits). This field is supported only on processors that support the 1-setting of the “load IA32\_PERF\_GLOBAL\_CTRL” VM-exit control.
  - IA32\_PAT (64 bits). This field is supported only on processors that support the 1-setting of the “load IA32\_PAT” VM-exit control.
  - IA32\_EFER (64 bits). This field is supported only on processors that support the 1-setting of the “load IA32\_EFER” VM-exit control.

In addition to the state identified here, some processor state components are loaded with fixed values on every VM exit; there are no fields corresponding to these components in the host-state area. See Section 27.5 for details of how state is loaded on VM exits.

## 24.6 VM-EXECUTION CONTROL FIELDS

The VM-execution control fields govern VMX non-root operation. These are described in Section 24.6.1 through Section 24.6.8.

### 24.6.1 Pin-Based VM-Execution Controls

The pin-based VM-execution controls constitute a 32-bit vector that governs the handling of asynchronous events (for example: interrupts).<sup>1</sup> Table 24-5 lists the controls. See Chapter 27 for how these controls affect processor behavior in VMX non-root operation.

---

1. Some asynchronous events cause VM exits regardless of the settings of the pin-based VM-execution controls (see Section 25.2).

**Table 24-5. Definitions of Pin-Based VM-Execution Controls**

| Bit Position(s) | Name                          | Description  |
|-----------------|-------------------------------|--|
| 0               | External-interrupt exiting    | If this control is 1, external interrupts cause VM exits. Otherwise, they are delivered normally through the guest interrupt-descriptor table (IDT). If this control is 1, the value of RFLAGS.IF does not affect interrupt blocking.  |
| 3               | NMI exiting                   | If this control is 1, non-maskable interrupts (NMIs) cause VM exits. Otherwise, they are delivered normally using descriptor 2 of the IDT. This control also determines interactions between IRET and blocking by NMI (see Section 25.3).                                      |
| 5               | Virtual NMIs                  | If this control is 1, NMIs are never blocked and the “blocking by NMI” bit (bit 3) in the interruptibility-state field indicates “virtual-NMI blocking” (see Table 24-3). This control also interacts with the “NMI-window exiting” VM-execution control (see Section 24.6.2). |
| 6               | Activate VMX-preemption timer | If this control is 1, the VMX-preemption timer counts down in VMX non-root operation; see Section 25.5.1. A VM exit occurs when the timer counts down to zero; see Section 25.2.   |
| 7               | Process posted interrupts     | If this control is 1, the processor treats interrupts with the posted-interrupt notification vector (see Section 24.6.8) specially, updating the virtual-APIC page with posted-interrupt requests (see Section 29.6).  |

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs `IA32_VMX_PINBASED_CTLS` and `IA32_VMX_TRUE_PINBASED_CTLS` (see Appendix A.3.1) to determine how to set reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 26.2.1.1).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 1, 2, and 4. The VMX capability MSR `IA32_VMX_PINBASED_CTLS` will always report that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR `IA32_VMX_TRUE_PINBASED_CTLS` MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

## 24.6.2 Processor-Based VM-Execution Controls

The processor-based VM-execution controls constitute two 32-bit vectors that govern the handling of synchronous events, mainly those caused by the execution of specific instructions.<sup>1</sup> These are the **primary processor-based VM-execution controls** and the **secondary processor-based VM-execution controls**.

Table 24-6 lists the primary processor-based VM-execution controls. See Chapter 25 for more details of how these controls affect processor behavior in VMX non-root operation.

**Table 24-6. Definitions of Primary Processor-Based VM-Execution Controls**

| Bit Position(s) | Name                     | Description   |
|-----------------|--------------------------|---|
| 2               | Interrupt-window exiting | If this control is 1, a VM exit occurs at the beginning of any instruction if RFLAGS.IF = 1 and there are no other blocking of interrupts (see Section 24.4.2).   |
| 3               | Use TSC offsetting       | This control determines whether executions of RDTSC, executions of RDTSCP, and executions of RDMSR that read from the <code>IA32_TIME_STAMP_COUNTER</code> MSR return a value modified by the TSC offset field (see Section 24.6.5 and Section 25.3). |
| 7               | HLT exiting              | This control determines whether executions of HLT cause VM exits.   |
| 9               | INVLPG exiting           | This determines whether executions of INVLPG cause VM exits.  |
| 10              | MWAIT exiting            | This control determines whether executions of MWAIT cause VM exits.   |
| 11              | RDPNC exiting            | This control determines whether executions of RDPNC cause VM exits.   |
| 12              | RDTSC exiting            | This control determines whether executions of RDTSC and RDTSCP cause VM exits.  |

1. Some instructions cause VM exits regardless of the settings of the processor-based VM-execution controls (see Section 25.1.2), as do task switches (see Section 25.2).

**Table 24-6. Definitions of Primary Processor-Based VM-Execution Controls (Contd.)**

| Bit Position(s) | Name                        | Description   |
|-----------------|-----------------------------|---|
| 15              | CR3-load exiting            | In conjunction with the CR3-target controls (see Section 24.6.7), this control determines whether executions of MOV to CR3 cause VM exits. See Section 25.1.3.<br><br>The first processors to support the virtual-machine extensions supported only the 1-setting of this control.  |
| 16              | CR3-store exiting           | This control determines whether executions of MOV from CR3 cause VM exits.<br><br>The first processors to support the virtual-machine extensions supported only the 1-setting of this control.  |
| 19              | CR8-load exiting            | This control determines whether executions of MOV to CR8 cause VM exits.  |
| 20              | CR8-store exiting           | This control determines whether executions of MOV from CR8 cause VM exits.  |
| 21              | Use TPR shadow              | Setting this control to 1 enables TPR virtualization and other APIC-virtualization features. See Chapter 29.  |
| 22              | NMI-window exiting          | If this control is 1, a VM exit occurs at the beginning of any instruction if there is no virtual-NMI blocking (see Section 24.4.2).  |
| 23              | MOV-DR exiting              | This control determines whether executions of MOV DR cause VM exits.  |
| 24              | Unconditional I/O exiting   | This control determines whether executions of I/O instructions (IN, INS/INSB/INSW/INSD, OUT, and OUTS/OUTSB/OUTSW/OUTSD) cause VM exits.  |
| 25              | Use I/O bitmaps             | This control determines whether I/O bitmaps are used to restrict executions of I/O instructions (see Section 24.6.4 and Section 25.1.3).<br><br>For this control, “0” means “do not use I/O bitmaps” and “1” means “use I/O bitmaps.” If the I/O bitmaps are used, the setting of the “unconditional I/O exiting” control is ignored.                   |
| 27              | Monitor trap flag           | If this control is 1, the monitor trap flag debugging feature is enabled. See Section 25.5.2.   |
| 28              | Use MSR bitmaps             | This control determines whether MSR bitmaps are used to control execution of the RDMSR and WRMSR instructions (see Section 24.6.9 and Section 25.1.3).<br><br>For this control, “0” means “do not use MSR bitmaps” and “1” means “use MSR bitmaps.” If the MSR bitmaps are not used, all executions of the RDMSR and WRMSR instructions cause VM exits. |
| 29              | MONITOR exiting             | This control determines whether executions of MONITOR cause VM exits.   |
| 30              | PAUSE exiting               | This control determines whether executions of PAUSE cause VM exits.   |
| 31              | Activate secondary controls | This control determines whether the secondary processor-based VM-execution controls are used. If this control is 0, the logical processor operates as if all the secondary processor-based VM-execution controls were also 0.   |

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs `IA32_VMX_PROCBASED_CTL`s and `IA32_VMX_TRUE_PROCBASED_CTL`s (see Appendix A.3.2) to determine how to set reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 26.2.1.1).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 1, 4–6, 8, 13–16, and 26. The VMX capability MSR `IA32_VMX_PROCBASED_CTL`s will always report that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR `IA32_VMX_TRUE_PROCBASED_CTL`s MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

Bit 31 of the primary processor-based VM-execution controls determines whether the secondary processor-based VM-execution controls are used. If that bit is 0, VM entry and VMX non-root operation function as if all the secondary processor-based VM-execution controls were 0. Processors that support only the 0-setting of bit 31 of the primary processor-based VM-execution controls do not support the secondary processor-based VM-execution controls.

Table 24-7 lists the secondary processor-based VM-execution controls. See Chapter 25 for more details of how these controls affect processor behavior in VMX non-root operation.

**Table 24-7. Definitions of Secondary Processor-Based VM-Execution Controls**

| Bit Position(s) | Name                               | Description  |
|-----------------|------------------------------------|--|
| 0               | Virtualize APIC accesses           | If this control is 1, the logical processor treats specially accesses to the page with the APIC-access address. See Section 29.4.  |
| 1               | Enable EPT                         | If this control is 1, extended page tables (EPT) are enabled. See Section 28.2.  |
| 2               | Descriptor-table exiting           | This control determines whether executions of LGDT, LIDT, LLDT, LTR, SGDT, SIDT, SLDT, and STR cause VM exits.   |
| 3               | Enable RDTSCP                      | If this control is 0, any execution of RDTSCP causes an invalid-opcode exception (#UD).  |
| 4               | Virtualize x2APIC mode             | If this control is 1, the logical processor treats specially RDMSR and WRMSR to APIC MSRs (in the range 800H-8FFH). See Section 29.5.  |
| 5               | Enable VPID                        | If this control is 1, cached translations of linear addresses are associated with a virtual-processor identifier (VPID). See Section 28.1.   |
| 6               | WBINVD exiting                     | This control determines whether executions of WBINVD cause VM exits.   |
| 7               | Unrestricted guest                 | This control determines whether guest software may run in unpaged protected mode or in real-address mode.  |
| 8               | APIC-register virtualization       | If this control is 1, the logical processor virtualizes certain APIC accesses. See Section 29.4 and Section 29.5.  |
| 9               | Virtual-interrupt delivery         | This controls enables the evaluation and delivery of pending virtual interrupts as well as the emulation of writes to the APIC registers that control interrupt prioritization.  |
| 10              | PAUSE-loop exiting                 | This control determines whether a series of executions of PAUSE can cause a VM exit (see Section 24.6.13 and Section 25.1.3).  |
| 11              | RDRAND exiting                     | This control determines whether executions of RDRAND cause VM exits.   |
| 12              | Enable INVPCID                     | If this control is 0, any execution of INVPCID causes a #UD.   |
| 13              | Enable VM functions                | Setting this control to 1 enables use of the VMFUNC instruction in VMX non-root operation. See Section 25.5.5.   |
| 14              | VMCS shadowing                     | If this control is 1, executions of VMREAD and VMWRITE in VMX non-root operation may access a shadow VMCS (instead of causing VM exits). See Section 24.10 and Section 30.3.   |
| 15              | Enable ENCLS exiting               | If this control is 1, executions of ENCLS consult the ENCLS-exiting bitmap to determine whether the instruction causes a VM exit. See Section 24.6.16 and Section 25.1.3.  |
| 16              | RDSEED exiting                     | This control determines whether executions of RDSEED cause VM exits.   |
| 17              | Enable PML                         | If this control is 1, an access to a guest-physical address that sets an EPT dirty bit first adds an entry to the page-modification log. See Section 28.2.5.   |
| 18              | EPT-violation #VE                  | If this control is 1, EPT violations may cause virtualization exceptions (#VE) instead of VM exits. See Section 25.5.6.  |
| 19              | Conceal VMX from PT                | If this control is 1, Intel Processor Trace suppresses from PIPs an indication that the processor was in VMX non-root operation and omits a VMCS packet from any PSB+ produced in VMX non-root operation (see Chapter 35).                   |
| 20              | Enable XSAVES/XRSTORS              | If this control is 0, any execution of XSAVES or XRSTORS causes a #UD.   |
| 22              | Mode-based execute control for EPT | If this control is 1, EPT execute permissions are based on whether the linear address being accessed is supervisor mode or user mode. See Chapter 28.  |
| 25              | Use TSC scaling                    | This control determines whether executions of RDTSC, executions of RDTSCP, and executions of RDMSR that read from the IA32_TIME_STAMP_COUNTER MSR return a value modified by the TSC multiplier field (see Section 24.6.5 and Section 25.3). |

All other bits in this field are reserved to 0. Software should consult the VMX capability MSR `IA32_VMX_PROCBASED_CTLX2` (see Appendix A.3.3) to determine which bits may be set to 1. Failure to clear reserved bits causes subsequent VM entries to fail (see Section 26.2.1.1).

### 24.6.3 Exception Bitmap

The **exception bitmap** is a 32-bit field that contains one bit for each exception. When an exception occurs, its vector is used to select a bit in this field. If the bit is 1, the exception causes a VM exit. If the bit is 0, the exception is delivered normally through the IDT, using the descriptor corresponding to the exception's vector.

Whether a page fault (exception with vector 14) causes a VM exit is determined by bit 14 in the exception bitmap as well as the error code produced by the page fault and two 32-bit fields in the VMCS (the **page-fault error-code mask** and **page-fault error-code match**). See Section 25.2 for details.

### 24.6.4 I/O-Bitmap Addresses

The VM-execution control fields include the 64-bit physical addresses of **I/O bitmaps A** and **B** (each of which are 4 KBytes in size). I/O bitmap A contains one bit for each I/O port in the range 0000H through 7FFFH; I/O bitmap B contains bits for ports in the range 8000H through FFFFH.

A logical processor uses these bitmaps if and only if the "use I/O bitmaps" control is 1. If the bitmaps are used, execution of an I/O instruction causes a VM exit if any bit in the I/O bitmaps corresponding to a port it accesses is 1. See Section 25.1.3 for details. If the bitmaps are used, their addresses must be 4-KByte aligned.

### 24.6.5 Time-Stamp Counter Offset and Multiplier

The VM-execution control fields include a 64-bit **TSC-offset** field. If the "RDTSC exiting" control is 0 and the "use TSC offsetting" control is 1, this field controls executions of the RDTSC and RDTSCP instructions. It also controls executions of the RDMSR instruction that read from the `IA32_TIME_STAMP_COUNTER` MSR. For all of these, the value of the TSC offset is added to the value of the time-stamp counter, and the sum is returned to guest software in EDI:EAX.

Processors that support the 1-setting of the "use TSC scaling" control also support a 64-bit **TSC-multiplier** field. If this control is 1 (and the "RDTSC exiting" control is 0 and the "use TSC offsetting" control is 1), this field also affects the executions of the RDTSC, RDTSCP, and RDMSR instructions identified above. Specifically, the contents of the time-stamp counter is first multiplied by the TSC multiplier before adding the TSC offset.

See Chapter 27 for a detailed treatment of the behavior of RDTSC, RDTSCP, and RDMSR in VMX non-root operation.

### 24.6.6 Guest/Host Masks and Read Shadows for CR0 and CR4

VM-execution control fields include **guest/host masks** and **read shadows** for the CR0 and CR4 registers. These fields control executions of instructions that access those registers (including CLTS, LMSW, MOV CR, and SMSW). They are 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not.

In general, bits set to 1 in a guest/host mask correspond to bits "owned" by the host:

- Guest attempts to set them (using CLTS, LMSW, or MOV to CR) to values differing from the corresponding bits in the corresponding read shadow cause VM exits.
- Guest reads (using MOV from CR or SMSW) return values for these bits from the corresponding read shadow.

Bits cleared to 0 correspond to bits "owned" by the guest; guest attempts to modify them succeed and guest reads return values for these bits from the control register itself.

See Chapter 27 for details regarding how these fields affect VMX non-root operation.

## 24.6.7 CR3-Target Controls

The VM-execution control fields include a set of 4 **CR3-target values** and a **CR3-target count**. The CR3-target values each have 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not. The CR3-target count has 32 bits on all processors.

An execution of MOV to CR3 in VMX non-root operation does not cause a VM exit if its source operand matches one of these values. If the CR3-target count is  $n$ , only the first  $n$  CR3-target values are considered; if the CR3-target count is 0, MOV to CR3 always causes a VM exit.

There are no limitations on the values that can be written for the CR3-target values. VM entry fails (see Section 26.2) if the CR3-target count is greater than 4.

Future processors may support a different number of CR3-target values. Software should read the VMX capability MSR IA32\_VMX\_MISC (see Appendix A.6) to determine the number of values supported.

## 24.6.8 Controls for APIC Virtualization

There are three mechanisms by which software accesses registers of the logical processor's local APIC:

- If the local APIC is in xAPIC mode, it can perform memory-mapped accesses to addresses in the 4-KByte page referenced by the physical address in the IA32\_APIC\_BASE MSR (see Section 10.4.4, "Local APIC Status and Location" in the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A* and *Intel® 64 Architecture Processor Topology Enumeration*).<sup>1</sup>
- If the local APIC is in x2APIC mode, it can access the local APIC's registers using the RDMSR and WRMSR instructions (see *Intel® 64 Architecture Processor Topology Enumeration*).
- In 64-bit mode, it can access the local APIC's task-priority register (TPR) using the MOV CR8 instruction.

There are five processor-based VM-execution controls (see Section 24.6.2) that control such accesses. There are "use TPR shadow", "virtualize APIC accesses", "virtualize x2APIC mode", "virtual-interrupt delivery", and "APIC-register virtualization". These controls interact with the following fields:

- **APIC-access address** (64 bits). This field contains the physical address of the 4-KByte **APIC-access page**. If the "virtualize APIC accesses" VM-execution control is 1, access to this page may cause VM exits or be virtualized by the processor. See Section 29.4.

The APIC-access address exists only on processors that support the 1-setting of the "virtualize APIC accesses" VM-execution control.

- **Virtual-APIC address** (64 bits). This field contains the physical address of the 4-KByte **virtual-APIC page**. The processor uses the virtual-APIC page to virtualize certain accesses to APIC registers and to manage virtual interrupts; see Chapter 29.

Depending on the setting of the controls indicated earlier, the virtual-APIC page may be accessed by the following operations:

- The MOV CR8 instructions (see Section 29.3).
- Accesses to the APIC-access page if, in addition, the "virtualize APIC accesses" VM-execution control is 1 (see Section 29.4).
- The RDMSR and WRMSR instructions if, in addition, the value of ECX is in the range 800H–8FFH (indicating an APIC MSR) and the "virtualize x2APIC mode" VM-execution control is 1 (see Section 29.5).

If the "use TPR shadow" VM-execution control is 1, VM entry ensures that the virtual-APIC address is 4-KByte aligned. The virtual-APIC address exists only on processors that support the 1-setting of the "use TPR shadow" VM-execution control.

- **TPR threshold** (32 bits). Bits 3:0 of this field determine the threshold below which bits 7:4 of VTPR (see Section 29.1.1) cannot fall. If the "virtual-interrupt delivery" VM-execution control is 0, a VM exit occurs after an operation (e.g., an execution of MOV to CR8) that reduces the value of those bits below the TPR threshold. See Section 29.1.2.

---

1. If the local APIC does not support x2APIC mode, it is always in xAPIC mode.

The TPR threshold exists only on processors that support the 1-setting of the “use TPR shadow” VM-execution control.

- **EOI-exit bitmap** (4 fields; 64 bits each). These fields are supported only on processors that support the 1-setting of the “virtual-interrupt delivery” VM-execution control. They are used to determine which virtualized writes to the APIC’s EOI register cause VM exits:
  - EOI\_EXIT0 contains bits for vectors from 0 (bit 0) to 63 (bit 63).
  - EOI\_EXIT1 contains bits for vectors from 64 (bit 0) to 127 (bit 63).
  - EOI\_EXIT2 contains bits for vectors from 128 (bit 0) to 191 (bit 63).
  - EOI\_EXIT3 contains bits for vectors from 192 (bit 0) to 255 (bit 63).

See Section 29.1.4 for more information on the use of this field.

- **Posted-interrupt notification vector** (16 bits). This field is supported only on processors that support the 1-setting of the “process posted interrupts” VM-execution control. Its low 8 bits contain the interrupt vector that is used to notify a logical processor that virtual interrupts have been posted. See Section 29.6 for more information on the use of this field.
- **Posted-interrupt descriptor address** (64 bits). This field is supported only on processors that support the 1-setting of the “process posted interrupts” VM-execution control. It is the physical address of a 64-byte aligned posted interrupt descriptor. See Section 29.6 for more information on the use of this field.

### 24.6.9 MSR-Bitmap Address

On processors that support the 1-setting of the “use MSR bitmaps” VM-execution control, the VM-execution control fields include the 64-bit physical address of four contiguous **MSR bitmaps**, which are each 1-KByte in size. This field does not exist on processors that do not support the 1-setting of that control. The four bitmaps are:

- **Read bitmap for low MSRs** (located at the MSR-bitmap address). This contains one bit for each MSR address in the range 00000000H to 00001FFFH. The bit determines whether an execution of RDMSR applied to that MSR causes a VM exit.
- **Read bitmap for high MSRs** (located at the MSR-bitmap address plus 1024). This contains one bit for each MSR address in the range C0000000H to C0001FFFH. The bit determines whether an execution of RDMSR applied to that MSR causes a VM exit.
- **Write bitmap for low MSRs** (located at the MSR-bitmap address plus 2048). This contains one bit for each MSR address in the range 00000000H to 00001FFFH. The bit determines whether an execution of WRMSR applied to that MSR causes a VM exit.
- **Write bitmap for high MSRs** (located at the MSR-bitmap address plus 3072). This contains one bit for each MSR address in the range C0000000H to C0001FFFH. The bit determines whether an execution of WRMSR applied to that MSR causes a VM exit.

A logical processor uses these bitmaps if and only if the “use MSR bitmaps” control is 1. If the bitmaps are used, an execution of RDMSR or WRMSR causes a VM exit if the value of RCX is in neither of the ranges covered by the bitmaps or if the appropriate bit in the MSR bitmaps (corresponding to the instruction and the RCX value) is 1. See Section 25.1.3 for details. If the bitmaps are used, their address must be 4-KByte aligned.

### 24.6.10 Executive-VMCS Pointer

The executive-VMCS pointer is a 64-bit field used in the dual-monitor treatment of system-management interrupts (SMIs) and system-management mode (SMM). SMM VM exits save this field as described in Section 34.15.2. VM entries that return from SMM use this field as described in Section 34.15.4.

### 24.6.11 Extended-Page-Table Pointer (EPTP)

The **extended-page-table pointer** (EPTP) contains the address of the base of EPT PML4 table (see Section 28.2.2), as well as other EPT configuration information. The format of this field is shown in Table 24-8.

**Table 24-8. Format of Extended-Page-Table Pointer**

| Bit Position(s) | Field  |
|-----------------|--|
| 2:0             | EPT paging-structure memory type (see Section 28.2.6):<br>0 = Uncacheable (UC)<br>6 = Write-back (WB)<br>Other values are reserved. <sup>1</sup> |
| 5:3             | This value is 1 less than the EPT page-walk length (see Section 28.2.2)  |
| 6               | Setting this control to 1 enables accessed and dirty flags for EPT (see Section 28.2.4) <sup>2</sup>   |
| 11:7            | Reserved   |
| N-1:12          | Bits N-1:12 of the physical address of the 4-KByte aligned EPT PML4 table <sup>3</sup>   |
| 63:N            | Reserved   |

**NOTES:**

1. Software should read the VMX capability MSR IA32\_VMX\_EPT\_VPID\_CAP (see Appendix A.10) to determine what EPT paging-structure memory types are supported.
2. Not all processors support accessed and dirty flags for EPT. Software should read the VMX capability MSR IA32\_VMX\_EPT\_VPID\_CAP (see Appendix A.10) to determine whether the processor supports this feature.
3. N is the physical-address width supported by the logical processor. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

The EPTP exists only on processors that support the 1-setting of the “enable EPT” VM-execution control.

### 24.6.12 Virtual-Processor Identifier (VPID)

The **virtual-processor identifier** (VPID) is a 16-bit field. It exists only on processors that support the 1-setting of the “enable VPID” VM-execution control. See Section 28.1 for details regarding the use of this field.

### 24.6.13 Controls for PAUSE-Loop Exiting

On processors that support the 1-setting of the “PAUSE-loop exiting” VM-execution control, the VM-execution control fields include the following 32-bit fields:

- **PLE\_Gap.** Software can configure this field as an upper bound on the amount of time between two successive executions of PAUSE in a loop.
- **PLE\_Window.** Software can configure this field as an upper bound on the amount of time a guest is allowed to execute in a PAUSE loop.

These fields measure time based on a counter that runs at the same rate as the timestamp counter (TSC). See Section 25.1.3 for more details regarding PAUSE-loop exiting.

### 24.6.14 VM-Function Controls

The **VM-function controls** constitute a 64-bit vector that governs use of the VMFUNC instruction in VMX non-root operation. This field is supported only on processors that support the 1-settings of both the “activate secondary controls” primary processor-based VM-execution control and the “enable VM functions” secondary processor-based VM-execution control.

Table 24-9 lists the VM-function controls. See Section 25.5.5 for more details of how these controls affect processor behavior in VMX non-root operation.

**Table 24-9. Definitions of VM-Function Controls**

| Bit Position(s) | Name           | Description  |
|-----------------|----------------|--|
| 0               | EPTP switching | The EPTP-switching VM function changes the EPT pointer to a value chosen from the EPTP list. See Section 25.5.5.3. |

All other bits in this field are reserved to 0. Software should consult the VMX capability MSR IA32\_VMX\_VMFUNC (see Appendix A.11) to determine which bits are reserved. Failure to clear reserved bits causes subsequent VM entries to fail (see Section 26.2.1.1).

Processors that support the 1-setting of the “EPTP switching” VM-function control also support a 64-bit field called the **EPTP-list address**. This field contains the physical address of the 4-KByte EPTP list. The EPTP list comprises 512 8-Byte entries (each an EPTP value) and is used by the EPTP-switching VM function (see Section 25.5.5.3).

### 24.6.15 VMCS Shadowing Bitmap Addresses

On processors that support the 1-setting of the “VMCS shadowing” VM-execution control, the VM-execution control fields include the 64-bit physical addresses of the **VMREAD bitmap** and the **VMWRITE bitmap**. Each bitmap is 4 KBytes in size and thus contains 32 KBits. The addresses are the **VMREAD-bitmap address** and the **VMWRITE-bitmap address**.

If the “VMCS shadowing” VM-execution control is 1, executions of VMREAD and VMWRITE may consult these bitmaps (see Section 24.10 and Section 30.3).

### 24.6.16 ENCLS-Exiting Bitmap

The **ENCLS-exiting bitmap** is a 64-bit field. If the “enable ENCLS exiting” VM-execution control is 1, execution of ENCLS causes a VM exit if the bit in this field corresponding to the value of EAX is 1. If the bit is 0, the instruction executes normally. See Section 25.1.3 for more information.

### 24.6.17 Control Field for Page-Modification Logging

The **PML address** is a 64-bit field. It is the 4-KByte aligned address of the **page-modification log**. The page-modification log consists of 512 64-bit entries. It is used for the page-modification logging feature. Details of the page-modification logging are given in Section 28.2.5.

If the “enable PML” VM-execution control is 1, VM entry ensures that the PML address is 4-KByte aligned. The PML address exists only on processors that support the 1-setting of the “enable PML” VM-execution control.

### 24.6.18 Controls for Virtualization Exceptions

On processors that support the 1-setting of the “EPT-violation #VE” VM-execution control, the VM-execution control fields include the following:

- **Virtualization-exception information address** (64 bits). This field contains the physical address of the **virtualization-exception information area**. When a logical processor encounters a virtualization exception, it saves virtualization-exception information at the virtualization-exception information address; see Section 25.5.6.2.

- **EPTP index** (16 bits). When an EPT violation causes a virtualization exception, the processor writes the value of this field to the virtualization-exception information area. The EPTP-switching VM function updates this field (see Section 25.5.5.3).

### 24.6.19 XSS-Exiting Bitmap

On processors that support the 1-setting of the “enable XSAVES/XRSTORS” VM-execution control, the VM-execution control fields include a 64-bit **XSS-exiting bitmap**. If the “enable XSAVES/XRSTORS” VM-execution control is 1, executions of XSAVES and XRSTORS may consult this bitmap (see Section 25.1.3 and Section 25.3).

## 24.7 VM-EXIT CONTROL FIELDS

The VM-exit control fields govern the behavior of VM exits. They are discussed in Section 24.7.1 and Section 24.7.2.

### 24.7.1 VM-Exit Controls

The VM-exit controls constitute a 32-bit vector that governs the basic operation of VM exits. Table 24-10 lists the controls supported. See Chapter 27 for complete details of how these controls affect VM exits.

**Table 24-10. Definitions of VM-Exit Controls**

| Bit Position(s) | Name                            | Description  |
|-----------------|---------------------------------|--|
| 2               | Save debug controls             | This control determines whether DR7 and the IA32_DEBUGCTL MSR are saved on VM exit. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.   |
| 9               | Host address-space size         | On processors that support Intel 64 architecture, this control determines whether a logical processor is in 64-bit mode after the next VM exit. Its value is loaded into CS.L, IA32_EFER.LME, and IA32_EFER.LMA on every VM exit. <sup>1</sup><br>This control must be 0 on processors that do not support Intel 64 architecture.  |
| 12              | Load IA32_PERF_GLOBAL_CTRL      | This control determines whether the IA32_PERF_GLOBAL_CTRL MSR is loaded on VM exit.  |
| 15              | Acknowledge interrupt on exit   | This control affects VM exits due to external interrupts: <ul style="list-style-type: none"> <li>▪ If such a VM exit occurs and this control is 1, the logical processor acknowledges the interrupt controller, acquiring the interrupt’s vector. The vector is stored in the VM-exit interruption-information field, which is marked valid.</li> <li>▪ If such a VM exit occurs and this control is 0, the interrupt is not acknowledged and the VM-exit interruption-information field is marked invalid.</li> </ul> |
| 18              | Save IA32_PAT                   | This control determines whether the IA32_PAT MSR is saved on VM exit.  |
| 19              | Load IA32_PAT                   | This control determines whether the IA32_PAT MSR is loaded on VM exit.   |
| 20              | Save IA32_EFER                  | This control determines whether the IA32_EFER MSR is saved on VM exit.   |
| 21              | Load IA32_EFER                  | This control determines whether the IA32_EFER MSR is loaded on VM exit.  |
| 22              | Save VMX-preemption timer value | This control determines whether the value of the VMX-preemption timer is saved on VM exit.   |
| 23              | Clear IA32_BNDCFGS              | This control determines whether the IA32_BNDCFGS MSR is cleared on VM exit.  |
| 24              | Conceal VMX from PT             | If this control is 1, Intel Processor Trace does not produce a paging information packet (PIP) on a VM exit or a VMCS packet on an SMM VM exit (see Chapter 35).   |

**NOTES:**

1. Since Intel 64 architecture specifies that `IA32_EFER.LMA` is always set to the logical-AND of `CRO.PG` and `IA32_EFER.LME`, and since `CRO.PG` is always 1 in VMX operation, `IA32_EFER.LMA` is always identical to `IA32_EFER.LME` in VMX operation.

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs `IA32_VMX_EXIT_CTLS` and `IA32_VMX_TRUE_EXIT_CTLS` (see Appendix A.4) to determine how it should set the reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 26.2.1.2).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 0–8, 10, 11, 13, 14, 16, and 17. The VMX capability MSR `IA32_VMX_EXIT_CTLS` always reports that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR `IA32_VMX_TRUE_EXIT_CTLS` MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

## 24.7.2 VM-Exit Controls for MSRs

A VMM may specify lists of MSRs to be stored and loaded on VM exits. The following VM-exit control fields determine how MSRs are stored on VM exits:

- **VM-exit MSR-store count** (32 bits). This field specifies the number of MSRs to be stored on VM exit. It is recommended that this count not exceed 512 bytes.<sup>1</sup> Otherwise, unpredictable processor behavior (including a machine check) may result during VM exit.
- **VM-exit MSR-store address** (64 bits). This field contains the physical address of the VM-exit MSR-store area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-exit MSR-store count. The format of each entry is given in Table 24-11. If the VM-exit MSR-store count is not zero, the address must be 16-byte aligned.

**Table 24-11. Format of an MSR Entry**

| Bit Position(s) | Contents  |
|-----------------|-----------|
| 31:0            | MSR index |
| 63:32           | Reserved  |
| 127:64          | MSR data  |

See Section 27.4 for how this area is used on VM exits.

The following VM-exit control fields determine how MSRs are loaded on VM exits:

- **VM-exit MSR-load count** (32 bits). This field contains the number of MSRs to be loaded on VM exit. It is recommended that this count not exceed 512 bytes. Otherwise, unpredictable processor behavior (including a machine check) may result during VM exit.<sup>2</sup>
- **VM-exit MSR-load address** (64 bits). This field contains the physical address of the VM-exit MSR-load area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-exit MSR-load count (see Table 24-11). If the VM-exit MSR-load count is not zero, the address must be 16-byte aligned.

See Section 27.6 for how this area is used on VM exits.

## 24.8 VM-ENTRY CONTROL FIELDS

The VM-entry control fields govern the behavior of VM entries. They are discussed in Sections 24.8.1 through 24.8.3.

1. Future implementations may allow more MSRs to be stored reliably. Software should consult the VMX capability MSR `IA32_VMX_MISC` to determine the number supported (see Appendix A.6).
2. Future implementations may allow more MSRs to be loaded reliably. Software should consult the VMX capability MSR `IA32_VMX_MISC` to determine the number supported (see Appendix A.6).

## 24.8.1 VM-Entry Controls

The VM-entry controls constitute a 32-bit vector that governs the basic operation of VM entries. Table 24-12 lists the controls supported. See Chapter 24 for how these controls affect VM entries.

**Table 24-12. Definitions of VM-Entry Controls**

| Bit Position(s) | Name                              | Description   |
|-----------------|-----------------------------------|---|
| 2               | Load debug controls               | This control determines whether DR7 and the IA32_DEBUGCTL MSR are loaded on VM entry. The first processors to support the virtual-machine extensions supported only the 1-setting of this control.  |
| 9               | IA-32e mode guest                 | On processors that support Intel 64 architecture, this control determines whether the logical processor is in IA-32e mode after VM entry. Its value is loaded into IA32_EFER.LMA as part of VM entry. <sup>1</sup><br>This control must be 0 on processors that do not support Intel 64 architecture. |
| 10              | Entry to SMM                      | This control determines whether the logical processor is in system-management mode (SMM) after VM entry. This control must be 0 for any VM entry from outside SMM.  |
| 11              | Deactivate dual-monitor treatment | If set to 1, the default treatment of SMIs and SMM is in effect after the VM entry (see Section 34.15.7). This control must be 0 for any VM entry from outside SMM.   |
| 13              | Load IA32_PERF_GLOBAL_CTRL        | This control determines whether the IA32_PERF_GLOBAL_CTRL MSR is loaded on VM entry.  |
| 14              | Load IA32_PAT                     | This control determines whether the IA32_PAT MSR is loaded on VM entry.   |
| 15              | Load IA32_EFER                    | This control determines whether the IA32_EFER MSR is loaded on VM entry.  |
| 16              | Load IA32_BNDCFGS                 | This control determines whether the IA32_BNDCFGS MSR is loaded on VM entry.   |
| 17              | Conceal VMX from PT               | If this control is 1, Intel Processor Trace does not produce a paging information packet (PIP) on a VM entry or a VMCS packet on a VM entry that returns from SMM (see Chapter 35).   |

### NOTES:

1. Bit 5 of the IA32\_VMX\_MISC MSR is read as 1 on any logical processor that supports the 1-setting of the “unrestricted guest” VM-execution control. If it is read as 1, every VM exit stores the value of IA32\_EFER.LMA into the “IA-32e mode guest” VM-entry control (see Section 27.2).

All other bits in this field are reserved, some to 0 and some to 1. Software should consult the VMX capability MSRs IA32\_VMX\_ENTRY\_CTLS and IA32\_VMX\_TRUE\_ENTRY\_CTLS (see Appendix A.5) to determine how it should set the reserved bits. Failure to set reserved bits properly causes subsequent VM entries to fail (see Section 26.2.1.3).

The first processors to support the virtual-machine extensions supported only the 1-settings of bits 0–8 and 12. The VMX capability MSR IA32\_VMX\_ENTRY\_CTLS always reports that these bits must be 1. Logical processors that support the 0-settings of any of these bits will support the VMX capability MSR IA32\_VMX\_TRUE\_ENTRY\_CTLS MSR, and software should consult this MSR to discover support for the 0-settings of these bits. Software that is not aware of the functionality of any one of these bits should set that bit to 1.

## 24.8.2 VM-Entry Controls for MSRs

A VMM may specify a list of MSRs to be loaded on VM entries. The following VM-entry control fields manage this functionality:

- **VM-entry MSR-load count** (32 bits). This field contains the number of MSRs to be loaded on VM entry. It is recommended that this count not exceed 512 bytes. Otherwise, unpredictable processor behavior (including a machine check) may result during VM entry.<sup>1</sup>

1. Future implementations may allow more MSRs to be loaded reliably. Software should consult the VMX capability MSR IA32\_VMX\_MISC to determine the number supported (see Appendix A.6).

- **VM-entry MSR-load address** (64 bits). This field contains the physical address of the VM-entry MSR-load area. The area is a table of entries, 16 bytes per entry, where the number of entries is given by the VM-entry MSR-load count. The format of entries is described in Table 24-11. If the VM-entry MSR-load count is not zero, the address must be 16-byte aligned.

See Section 26.4 for details of how this area is used on VM entries.

### 24.8.3 VM-Entry Controls for Event Injection

VM entry can be configured to conclude by delivering an event through the IDT (after all guest state and MSRs have been loaded). This process is called **event injection** and is controlled by the following three VM-entry control fields:

- **VM-entry interruption-information field** (32 bits). This field provides details about the event to be injected. Table 24-13 describes the field.

**Table 24-13. Format of the VM-Entry Interruption-Information Field**

| Bit Position(s) | Content  |
|-----------------|--|
| 7:0             | Vector of interrupt or exception   |
| 10:8            | Interruption type:<br>0: External interrupt<br>1: Reserved<br>2: Non-maskable interrupt (NMI)<br>3: Hardware exception<br>4: Software interrupt<br>5: Privileged software exception<br>6: Software exception<br>7: Other event |
| 11              | Deliver error code (0 = do not deliver; 1 = deliver)   |
| 30:12           | Reserved   |
| 31              | Valid  |

- The **vector** (bits 7:0) determines which entry in the IDT is used or which other event is injected.
- The **interruption type** (bits 10:8) determines details of how the injection is performed. In general, a VMM should use the type **hardware exception** for all exceptions other than breakpoint exceptions (#BP; generated by INT3) and overflow exceptions (#OF; generated by INTO); it should use the type **software exception** for #BP and #OF. The type **other event** is used for injection of events that are not delivered through the IDT.
- For exceptions, the **deliver-error-code** bit (bit 11) determines whether delivery pushes an error code on the guest stack.
- VM entry injects an event if and only if the **valid bit** (bit 31) is 1. The valid bit in this field is cleared on every VM exit (see Section 27.2).
- **VM-entry exception error code** (32 bits). This field is used if and only if the valid bit (bit 31) and the deliver-error-code bit (bit 11) are both set in the VM-entry interruption-information field.
- **VM-entry instruction length** (32 bits). For injection of events whose type is software interrupt, software exception, or privileged software exception, this field is used to determine the value of RIP that is pushed on the stack.

See Section 26.5 for details regarding the mechanics of event injection, including the use of the interruption type and the VM-entry instruction length.

VM exits clear the valid bit (bit 31) in the VM-entry interruption-information field.

## 24.9 VM-EXIT INFORMATION FIELDS

The VMCS contains a section of fields that contain information about the most recent VM exit.

On some processors, attempts to write to these fields with VMWRITE fail (see “VMWRITE—Write Field to Virtual-Machine Control Structure” in Chapter 30).<sup>1</sup>

### 24.9.1 Basic VM-Exit Information

The following VM-exit information fields provide basic information about a VM exit:

- **Exit reason** (32 bits). This field encodes the reason for the VM exit and has the structure given in Table 24-14.

**Table 24-14. Format of Exit Reason**

| Bit Position(s) | Contents   |
|-----------------|--|
| 15:0            | Basic exit reason  |
| 26:16           | Reserved (cleared to 0)  |
| 27              | A VM exit saves this bit as 1 to indicate that the VM exit was incident to enclave mode. |
| 28              | Pending MTF VM exit  |
| 29              | VM exit from VMX root operation  |
| 30              | Reserved (cleared to 0)  |
| 31              | VM-entry failure (0 = true VM exit; 1 = VM-entry failure)                                |

- Bits 15:0 provide basic information about the cause of the VM exit (if bit 31 is clear) or of the VM-entry failure (if bit 31 is set). Appendix C enumerates the basic exit reasons.
- Bit 28 is set only by an SMM VM exit (see Section 34.15.2) that took priority over an MTF VM exit (see Section 25.5.2) that would have occurred had the SMM VM exit not occurred. See Section 34.15.2.3.
- Bit 29 is set if and only if the processor was in VMX root operation at the time the VM exit occurred. This can happen only for SMM VM exits. See Section 34.15.2.
- Because some VM-entry failures load processor state from the host-state area (see Section 26.7), software must be able to distinguish such cases from true VM exits. Bit 31 is used for that purpose.
- **Exit qualification** (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field contains additional information about the cause of VM exits due to the following: debug exceptions; page-fault exceptions; start-up IPIs (SIPIs); task switches; INVEPT; INVLPG; INVVPID; LGDT; LIDT; LLDT; LTR; SGDT; SIDT; SLDT; STR; VMCLEAR; VMPTRLD; VMPTRST; VMREAD; VMWRITE; VMXON; control-register accesses; MOV DR; I/O instructions; and MWAIT. The format of the field depends on the cause of the VM exit. See Section 27.2.1 for details.
- **Guest-linear address** (64 bits; 32 bits on processors that do not support Intel 64 architecture). This field is used in the following cases:
  - VM exits due to attempts to execute LMSW with a memory operand.
  - VM exits due to attempts to execute INS or OUTS.
  - VM exits due to system-management interrupts (SMIs) that arrive immediately after retirement of I/O instructions.
  - Certain VM exits due to EPT violations
 See Section 27.2.1 and Section 34.15.2.3 for details of when and how this field is used.

1. Software can discover whether these fields can be written by reading the VMX capability MSR IA32\_VMX\_MISC (see Appendix A.6).

- **Guest-physical address** (64 bits). This field is used VM exits due to EPT violations and EPT misconfigurations. See Section 27.2.1 for details of when and how this field is used.

## 24.9.2 Information for VM Exits Due to Vectored Events

Event-specific information is provided for VM exits due to the following vectored events: exceptions (including those generated by the instructions INT3, INTO, BOUND, and UD); external interrupts that occur while the “acknowledge interrupt on exit” VM-exit control is 1; and non-maskable interrupts (NMIs). This information is provided in the following fields:

- **VM-exit interruption information** (32 bits). This field receives basic information associated with the event causing the VM exit. Table 24-15 describes this field.

**Table 24-15. Format of the VM-Exit Interruption-Information Field**

| Bit Position(s) | Content   |
|-----------------|---|
| 7:0             | Vector of interrupt or exception  |
| 10:8            | Interruption type:<br>0: External interrupt<br>1: Not used<br>2: Non-maskable interrupt (NMI)<br>3: Hardware exception<br>4 – 5: Not used<br>6: Software exception<br>7: Not used |
| 11              | Error code valid (0 = invalid; 1 = valid)   |
| 12              | NMI unblocking due to IRET  |
| 30:13           | Reserved (cleared to 0)   |
| 31              | Valid   |

- **VM-exit interruption error code** (32 bits). For VM exits caused by hardware exceptions that would have delivered an error code on the stack, this field receives that error code.

Section 27.2.2 provides details of how these fields are saved on VM exits.

## 24.9.3 Information for VM Exits That Occur During Event Delivery

Additional information is provided for VM exits that occur during event delivery in VMX non-root operation.<sup>1</sup> This information is provided in the following fields:

- **IDT-vectoring information** (32 bits). This field receives basic information associated with the event that was being delivered when the VM exit occurred. Table 24-16 describes this field.

---

1. This includes cases in which the event delivery was caused by event injection as part of VM entry; see Section 26.5.1.2.

**Table 24-16. Format of the IDT-Vectoring Information Field**

| Bit Position(s) | Content   |
|-----------------|---|
| 7:0             | Vector of interrupt or exception  |
| 10:8            | Interruption type:<br>0: External interrupt<br>1: Not used<br>2: Non-maskable interrupt (NMI)<br>3: Hardware exception<br>4: Software interrupt<br>5: Privileged software exception<br>6: Software exception<br>7: Not used |
| 11              | Error code valid (0 = invalid; 1 = valid)   |
| 12              | Undefined   |
| 30:13           | Reserved (cleared to 0)   |
| 31              | Valid   |

- **IDT-vectoring error code** (32 bits). For VM exits that occur during delivery of hardware exceptions that would have delivered an error code on the stack, this field receives that error code.

See Section 27.2.3 provides details of how these fields are saved on VM exits.

## 24.9.4 Information for VM Exits Due to Instruction Execution

The following fields are used for VM exits caused by attempts to execute certain instructions in VMX non-root operation:

- **VM-exit instruction length** (32 bits). For VM exits resulting from instruction execution, this field receives the length in bytes of the instruction whose execution led to the VM exit.<sup>1</sup> See Section 27.2.4 for details of when and how this field is used.
- **VM-exit instruction information** (32 bits). This field is used for VM exits due to attempts to execute `INS`, `INVEPT`, `INVVPID`, `LIDT`, `LGDT`, `LLDT`, `LTR`, `OUTS`, `SIDT`, `SGDT`, `SLDT`, `STR`, `VMCLEAR`, `VMPTRLD`, `VMPTRST`, `VMREAD`, `VMWRITE`, or `VMXON`.<sup>2</sup> The format of the field depends on the cause of the VM exit. See Section 27.2.4 for details.

The following fields (64 bits each; 32 bits on processors that do not support Intel 64 architecture) are used only for VM exits due to SMIs that arrive immediately after retirement of I/O instructions. They provide information about that I/O instruction:

- **I/O RCX**. The value of RCX before the I/O instruction started.
- **I/O RSI**. The value of RSI before the I/O instruction started.
- **I/O RDI**. The value of RDI before the I/O instruction started.
- **I/O RIP**. The value of RIP before the I/O instruction started (the RIP that addressed the I/O instruction).

## 24.9.5 VM-Instruction Error Field

The 32-bit **VM-instruction error field** does not provide information about the most recent VM exit. In fact, it is not modified on VM exits. Instead, it provides information about errors encountered by a non-faulting execution of one of the VMX instructions.

- 
1. This field is also used for VM exits that occur during the delivery of a software interrupt or software exception.
  2. Whether the processor provides this information on VM exits due to attempts to execute `INS` or `OUTS` can be determined by consulting the VMX capability MSR `IA32_VMX_BASIC` (see Appendix A.1).

## 24.10 VMCS TYPES: ORDINARY AND SHADOW

Every VMCS is either an **ordinary VMCS** or a **shadow VMCS**. A VMCS's type is determined by the shadow-VMCS indicator in the VMCS region (this is the value of bit 31 of the first 4 bytes of the VMCS region; see Table 24-1): 0 indicates an ordinary VMCS, while 1 indicates a shadow VMCS. Shadow VMCSs are supported only on processors that support the 1-setting of the "VMCS shadowing" VM-execution control (see Section 24.6.2).

A shadow VMCS differs from an ordinary VMCS in two ways:

- An ordinary VMCS can be used for VM entry but a shadow VMCS cannot. Attempts to perform VM entry when the current VMCS is a shadow VMCS fail (see Section 26.1).
- The VMREAD and VMWRITE instructions can be used in VMX non-root operation to access a shadow VMCS but not an ordinary VMCS. This fact results from the following:
  - If the "VMCS shadowing" VM-execution control is 0, execution of the VMREAD and VMWRITE instructions in VMX non-root operation always cause VM exits (see Section 25.1.3).
  - If the "VMCS shadowing" VM-execution control is 1, execution of the VMREAD and VMWRITE instructions in VMX non-root operation can access the VMCS referenced by the VMCS link pointer (see Section 30.3).
  - If the "VMCS shadowing" VM-execution control is 1, VM entry ensures that any VMCS referenced by the VMCS link pointer is a shadow VMCS (see Section 26.3.1.5).

In VMX root operation, both types of VMCSs can be accessed with the VMREAD and VMWRITE instructions.

Software should not modify the shadow-VMCS indicator in the VMCS region of a VMCS that is active. Doing so may cause the VMCS to become corrupted (see Section 24.11.1). Before modifying the shadow-VMCS indicator, software should execute VMCLEAR for the VMCS to ensure that it is not active.

## 24.11 SOFTWARE USE OF THE VMCS AND RELATED STRUCTURES

This section details guidelines that software should observe when using a VMCS and related structures. It also provides descriptions of consequences for failing to follow guidelines.

### 24.11.1 Software Use of Virtual-Machine Control Structures

To ensure proper processor behavior, software should observe certain guidelines when using an active VMCS.

No VMCS should ever be active on more than one logical processor. If a VMCS is to be "migrated" from one logical processor to another, the first logical processor should execute VMCLEAR for the VMCS (to make it inactive on that logical processor and to ensure that all VMCS data are in memory) before the other logical processor executes VMPTRLD for the VMCS (to make it active on the second logical processor).<sup>1</sup> A VMCS that is made active on more than one logical processor may become **corrupted** (see below).

Software should not modify the shadow-VMCS indicator (see Table 24-1) in the VMCS region of a VMCS that is active. Doing so may cause the VMCS to become corrupted. Before modifying the shadow-VMCS indicator, software should execute VMCLEAR for the VMCS to ensure that it is not active.

Software should use the VMREAD and VMWRITE instructions to access the different fields in the current VMCS (see Section 24.11.2). Software should never access or modify the VMCS data of an active VMCS using ordinary memory operations, in part because the format used to store the VMCS data is implementation-specific and not architecturally defined, and also because a logical processor may maintain some VMCS data of an active VMCS on the processor and not in the VMCS region. The following items detail some of the hazards of accessing VMCS data using ordinary memory operations:

- Any data read from a VMCS with an ordinary memory read does not reliably reflect the state of the VMCS. Results may vary from time to time or from logical processor to logical processor.

---

1. As noted in Section 24.1, execution of the VMPTRLD instruction makes a VMCS is active. In addition, VM entry makes active any shadow VMCS referenced by the VMCS link pointer in the current VMCS. If a shadow VMCS is made active by VM entry, it is necessary to execute VMCLEAR for that VMCS before allowing that VMCS to become active on another logical processor.

- Writing to a VMCS with an ordinary memory write is not guaranteed to have a deterministic effect on the VMCS. Doing so may cause the VMCS to become corrupted (see below).

(Software can avoid these hazards by removing any linear-address mappings to a VMCS region before executing a VMPTRLD for that region and by not remapping it until after executing VMCLEAR for that region.)

If a logical processor leaves VMX operation, any VMCSs active on that logical processor may be corrupted (see below). To prevent such corruption of a VMCS that may be used either after a return to VMX operation or on another logical processor, software should execute VMCLEAR for that VMCS before executing the VMXOFF instruction or removing power from the processor (e.g., as part of a transition to the S3 and S4 power states).

This section has identified operations that may cause a VMCS to become corrupted. These operations may cause the VMCS's data to become undefined. Behavior may be unpredictable if that VMCS used subsequently on any logical processor. The following items detail some hazards of VMCS corruption:

- VM entries may fail for unexplained reasons or may load undesired processor state.
- The processor may not correctly support VMX non-root operation as documented in Chapter 27 and may generate unexpected VM exits.
- VM exits may load undesired processor state, save incorrect state into the VMCS, or cause the logical processor to transition to a shutdown state.

### 24.11.2 VMREAD, VMWRITE, and Encodings of VMCS Fields

Every field of the VMCS is associated with a 32-bit value that is its **encoding**. The encoding is provided in an operand to VMREAD and VMWRITE when software wishes to read or write that field. These instructions fail if given, in 64-bit mode, an operand that sets an encoding bit beyond bit 32. See Chapter 30 for a description of these instructions.

The structure of the 32-bit encodings of the VMCS components is determined principally by the width of the fields and their function in the VMCS. See Table 24-17.

**Table 24-17. Structure of VMCS Component Encoding**

| Bit Position(s) | Contents  |
|-----------------|---|
| 0               | Access type (0 = full; 1 = high); must be full for 16-bit, 32-bit, and natural-width fields |
| 9:1             | Index   |
| 11:10           | Type:<br>0: control<br>1: VM-exit information<br>2: guest state<br>3: host state            |
| 12              | Reserved (must be 0)  |
| 14:13           | Width:<br>0: 16-bit<br>1: 64-bit<br>2: 32-bit<br>3: natural-width                           |
| 31:15           | Reserved (must be 0)  |

The following items detail the meaning of the bits in each encoding:

- **Field width.** Bits 14:13 encode the width of the field.
  - A value of 0 indicates a 16-bit field.
  - A value of 1 indicates a 64-bit field.

- A value of 2 indicates a 32-bit field.
- A value of 3 indicates a **natural-width** field. Such fields have 64 bits on processors that support Intel 64 architecture and 32 bits on processors that do not.

Fields whose encodings use value 1 are specially treated to allow 32-bit software access to all 64 bits of the field. Such access is allowed by defining, for each such field, an encoding that allows direct access to the high 32 bits of the field. See below.

- **Field type.** Bits 11:10 encode the type of VMCS field: control, guest-state, host-state, or VM-exit information. (The last category also includes the VM-instruction error field.)
- **Index.** Bits 9:1 distinguish components with the same field width and type.
- **Access type.** Bit 0 must be 0 for all fields except for 64-bit fields (those with field-width 1; see above). A VMREAD or VMWRITE using an encoding with this bit cleared to 0 accesses the entire field. For a 64-bit field with field-width 1, a VMREAD or VMWRITE using an encoding with this bit set to 1 accesses only the high 32 bits of the field.

Appendix B gives the encodings of all fields in the VMCS.

The following describes the operation of VMREAD and VMWRITE based on processor mode, VMCS-field width, and access type:

- 16-bit fields:
  - A VMREAD returns the value of the field in bits 15:0 of the destination operand; other bits of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 15:0 of the source operand into the VMCS field; other bits of the source operand are not used.
- 32-bit fields:
  - A VMREAD returns the value of the field in bits 31:0 of the destination operand; in 64-bit mode, bits 63:32 of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 31:0 of the source operand into the VMCS field; in 64-bit mode, bits 63:32 of the source operand are not used.
- 64-bit fields and natural-width fields using the full access type outside IA-32e mode.
  - A VMREAD returns the value of bits 31:0 of the field in its destination operand; bits 63:32 of the field are ignored.
  - A VMWRITE writes the value of its source operand to bits 31:0 of the field and clears bits 63:32 of the field.
- 64-bit fields and natural-width fields using the full access type in 64-bit mode (only on processors that support Intel 64 architecture).
  - A VMREAD returns the value of the field in bits 63:0 of the destination operand
  - A VMWRITE writes the value of bits 63:0 of the source operand into the VMCS field.
- 64-bit fields using the high access type.
  - A VMREAD returns the value of bits 63:32 of the field in bits 31:0 of the destination operand; in 64-bit mode, bits 63:32 of the destination operand are cleared to 0.
  - A VMWRITE writes the value of bits 31:0 of the source operand to bits 63:32 of the field; in 64-bit mode, bits 63:32 of the source operand are not used.

Software seeking to read a 64-bit field outside IA-32e mode can use VMREAD with the full access type (reading bits 31:0 of the field) and VMREAD with the high access type (reading bits 63:32 of the field); the order of the two VMREAD executions is not important. Software seeking to modify a 64-bit field outside IA-32e mode should first use VMWRITE with the full access type (establishing bits 31:0 of the field while clearing bits 63:32) and then use VMWRITE with the high access type (establishing bits 63:32 of the field).

### 24.11.3 Initializing a VMCS

Software should initialize fields in a VMCS (using VMWRITE) before using the VMCS for VM entry. Failure to do so may result in unpredictable behavior; for example, a VM entry may fail for unexplained reasons, or a successful transition (VM entry or VM exit) may load processor state with unexpected values.

It is not necessary to initialize fields that the logical processor will not use. (For example, it is not necessary to initialize the MSR-bitmap address if the “use MSR bitmaps” VM-execution control is 0.)

A processor maintains some VMCS information that cannot be modified with the VMWRITE instruction; this includes a VMCS’s launch state (see Section 24.1). Such information may be stored in the VMCS data portion of a VMCS region. Because the format of this information is implementation-specific, there is no way for software to know, when it first allocates a region of memory for use as a VMCS region, how the processor will determine this information from the contents of the memory region.

In addition to its other functions, the VMCLEAR instruction initializes any implementation-specific information in the VMCS region referenced by its operand. To avoid the uncertainties of implementation-specific behavior, software should execute VMCLEAR on a VMCS region before making the corresponding VMCS active with VMPTRLD for the first time. (Figure 24-1 illustrates how execution of VMCLEAR puts a VMCS into a well-defined state.)

The following software usage is consistent with these limitations:

- VMCLEAR should be executed for a VMCS before it is used for VM entry for the first time.
- VMLAUNCH should be used for the first VM entry using a VMCS after VMCLEAR has been executed for that VMCS.
- VMRESUME should be used for any subsequent VM entry using a VMCS (until the next execution of VMCLEAR for the VMCS).

It is expected that, in general, VMRESUME will have lower latency than VMLAUNCH. Since “migrating” a VMCS from one logical processor to another requires use of VMCLEAR (see Section 24.11.1), which sets the launch state of the VMCS to “clear”, such migration requires the next VM entry to be performed using VMLAUNCH. Software developers can avoid the performance cost of increased VM-entry latency by avoiding unnecessary migration of a VMCS from one logical processor to another.

### 24.11.4 Software Access to Related Structures

In addition to data in the VMCS region itself, VMX non-root operation can be controlled by data structures that are referenced by pointers in a VMCS (for example, the I/O bitmaps). While the pointers to these data structures are parts of the VMCS, the data structures themselves are not. They are not accessible using VMREAD and VMWRITE but by ordinary memory writes.

Software should ensure that each such data structure is modified only when no logical processor with a current VMCS that references it is in VMX non-root operation. Doing otherwise may lead to unpredictable behavior (including behaviors identified in Section 24.11.1).

### 24.11.5 VMXON Region

Before executing VMXON, software allocates a region of memory (called the VMXON region)<sup>1</sup> that the logical processor uses to support VMX operation. The physical address of this region (the VMXON pointer) is provided in an operand to VMXON. The VMXON pointer is subject to the limitations that apply to VMCS pointers:

- The VMXON pointer must be 4-KByte aligned (bits 11:0 must be zero).
- The VMXON pointer must not set any bits beyond the processor’s physical-address width.<sup>2,3</sup>

1. The amount of memory required for the VMXON region is the same as that required for a VMCS region. This size is implementation specific and can be determined by consulting the VMX capability MSR IA32\_VMX\_BASIC (see Appendix A.1).

2. Software can determine a processor’s physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

3. If IA32\_VMX\_BASIC[48] is read as 1, the VMXON pointer must not set any bits in the range 63:32; see Appendix A.1.

Before executing VMXON, software should write the VMCS revision identifier (see Section 24.2) to the VMXON region. (Specifically, it should write the 31-bit VMCS revision identifier to bits 30:0 of the first 4 bytes of the VMXON region; bit 31 should be cleared to 0.) It need not initialize the VMXON region in any other way. Software should use a separate region for each logical processor and should not access or modify the VMXON region of a logical processor between execution of VMXON and VMXOFF on that logical processor. Doing otherwise may lead to unpredictable behavior (including behaviors identified in Section 24.11.1).

## 21. Updates to Chapter 28, Volume 3C

Change bars show changes to Chapter 28 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3C: System Programming Guide, Part 3*.

-----  
Change to chapter: Footnote update in Section 28.3.3.4 "Guidelines for Use of the INVEPT Instruction".

## CHAPTER 28

# VMX SUPPORT FOR ADDRESS TRANSLATION

---

The architecture for VMX operation includes two features that support address translation: virtual-processor identifiers (VPIDs) and the extended page-table mechanism (EPT). VPIDs are a mechanism for managing translations of linear addresses. EPT defines a layer of address translation that augments the translation of linear addresses.

Section 28.1 details the architecture of VPIDs. Section 28.2 provides the details of EPT. Section 28.3 explains how a logical processor may cache information from the paging structures, how it may use that cached information, and how software can manage the cached information.

## 28.1 VIRTUAL PROCESSOR IDENTIFIERS (VPIDS)

The original architecture for VMX operation required VMX transitions to flush the TLBs and paging-structure caches. This ensured that translations cached for the old linear-address space would not be used after the transition.

Virtual-processor identifiers (VPIDs) introduce to VMX operation a facility by which a logical processor may cache information for multiple linear-address spaces. When VPIDs are used, VMX transitions may retain cached information and the logical processor switches to a different linear-address space.

Section 28.3 details the mechanisms by which a logical processor manages information cached for multiple address spaces. A logical processor may tag some cached information with a 16-bit VPID. This section specifies how the current VPID is determined at any point in time:

- The current VPID is 0000H in the following situations:
  - Outside VMX operation. (This includes operation in system-management mode under the default treatment of SMIs and SMM with VMX operation; see Section 34.14.)
  - In VMX root operation.
  - In VMX non-root operation when the “enable VPID” VM-execution control is 0.
- If the logical processor is in VMX non-root operation and the “enable VPID” VM-execution control is 1, the current VPID is the value of the VPID VM-execution control field in the VMCS. (VM entry ensures that this value is never 0000H; see Section 26.2.1.1.)

VPIDs and PCIDs (see Section 4.10.1) can be used concurrently. When this is done, the processor associates cached information with both a VPID and a PCID. Such information is used only if the current VPID and PCID both match those associated with the cached information.

## 28.2 THE EXTENDED PAGE TABLE MECHANISM (EPT)

The extended page-table mechanism (EPT) is a feature that can be used to support the virtualization of physical memory. When EPT is in use, certain addresses that would normally be treated as physical addresses (and used to access memory) are instead treated as **guest-physical addresses**. Guest-physical addresses are translated by traversing a set of EPT paging structures to produce physical addresses that are used to access memory.

- Section 28.2.1 gives an overview of EPT.
- Section 28.2.2 describes operation of EPT-based address translation.
- Section 28.2.3 discusses VM exits that may be caused by EPT.
- Section 28.2.6 describes interactions between EPT and memory typing.

### 28.2.1 EPT Overview

EPT is used when the “enable EPT” VM-execution control is 1.<sup>1</sup> It translates the guest-physical addresses used in VMX non-root operation and those used by VM entry for event injection.

The translation from guest-physical addresses to physical addresses is determined by a set of **EPT paging structures**. The EPT paging structures are similar to those used to translate linear addresses while the processor is in IA-32e mode. Section 28.2.2 gives the details of the EPT paging structures.

If  $CR0.PG = 1$ , linear addresses are translated through paging structures referenced through control register CR3. While the “enable EPT” VM-execution control is 1, these are called **guest paging structures**. There are no guest paging structures if  $CR0.PG = 0$ .<sup>1</sup>

When the “enable EPT” VM-execution control is 1, the identity of **guest-physical addresses** depends on the value of  $CR0.PG$ :

- If  $CR0.PG = 0$ , each linear address is treated as a guest-physical address.
- If  $CR0.PG = 1$ , guest-physical addresses are those derived from the contents of control register CR3 and the guest paging structures. (This includes the values of the PDPTes, which logical processors store in internal, non-architectural registers.) The latter includes (in page-table entries and in other paging-structure entries for which bit 7—PS—is 1) the addresses to which linear addresses are translated by the guest paging structures.

If  $CR0.PG = 1$ , the translation of a linear address to a physical address requires multiple translations of guest-physical addresses using EPT. Assume, for example, that  $CR4.PAE = CR4.PSE = 0$ . The translation of a 32-bit linear address then operates as follows:

- Bits 31:22 of the linear address select an entry in the guest page directory located at the guest-physical address in CR3. The guest-physical address of the guest page-directory entry (PDE) is translated through EPT to determine the guest PDE’s physical address.
- Bits 21:12 of the linear address select an entry in the guest page table located at the guest-physical address in the guest PDE. The guest-physical address of the guest page-table entry (PTE) is translated through EPT to determine the guest PTE’s physical address.
- Bits 11:0 of the linear address is the offset in the page frame located at the guest-physical address in the guest PTE. The guest-physical address determined by this offset is translated through EPT to determine the physical address to which the original linear address translates.

In addition to translating a guest-physical address to a physical address, EPT specifies the privileges that software is allowed when accessing the address. Attempts at disallowed accesses are called **EPT violations** and cause VM exits. See Section 28.2.3.

A processor uses EPT to translate guest-physical addresses only when those addresses are used to access memory. This principle implies the following:

- The MOV to CR3 instruction loads CR3 with a guest-physical address. Whether that address is translated through EPT depends on whether PAE paging is being used.<sup>2</sup>
  - If PAE paging is not being used, the instruction does not use that address to access memory and does not cause it to be translated through EPT. (If  $CR0.PG = 1$ , the address will be translated through EPT on the next memory accessing using a linear address.)
  - If PAE paging is being used, the instruction loads the four (4) page-directory-pointer-table entries (PDPTes) from that address and it does cause the address to be translated through EPT.
- Section 4.4.1 identifies executions of MOV to CR0 and MOV to CR4 that load the PDPTes from the guest-physical address in CR3. Such executions cause that address to be translated through EPT.
- The PDPTes contain guest-physical addresses. The instructions that load the PDPTes (see above) do not use those addresses to access memory and do not cause them to be translated through EPT. The address in a PDPTE will be translated through EPT on the next memory accessing using a linear address that uses that PDPTE.

1. “Enable EPT” is a secondary processor-based VM-execution control. If bit 31 of the primary processor-based VM-execution controls is 0, the logical processor operates as if the “enable EPT” VM-execution control were 0. See Section 24.6.2.

1. If the capability MSR `IA32_VMX_CR0_FIXED0` reports that  $CR0.PG$  must be 1 in VMX operation,  $CR0.PG$  can be 0 in VMX non-root operation only if the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.

2. A logical processor uses PAE paging if  $CR0.PG = 1$ ,  $CR4.PAE = 1$  and  $IA32_EFER.LMA = 0$ . See Section 4.4 in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*.

## 28.2.2 EPT Translation Mechanism

The EPT translation mechanism uses only bits 47:0 of each guest-physical address.<sup>1</sup> It uses a page-walk length of 4, meaning that at most 4 EPT paging-structure entries are accessed to translate a guest-physical address.<sup>2</sup>

These 48 bits are partitioned by the logical processor to traverse the EPT paging structures:

- A 4-KByte naturally aligned EPT PML4 table is located at the physical address specified in bits 51:12 of the extended-page-table pointer (EPTP), a VM-execution control field (see Table 24-8 in Section 24.6.11). An EPT PML4 table comprises 512 64-bit entries (EPT PML4Es). An EPT PML4E is selected using the physical address defined as follows:
  - Bits 63:52 are all 0.
  - Bits 51:12 are from the EPTP.
  - Bits 11:3 are bits 47:39 of the guest-physical address.
  - Bits 2:0 are all 0.

Because an EPT PML4E is identified using bits 47:39 of the guest-physical address, it controls access to a 512-GByte region of the guest-physical-address space. The format of an EPT PML4E is given in Table 28-1.

**Table 28-1. Format of an EPT PML4 Entry (PML4E) that References an EPT Page-Directory-Pointer Table**

| Bit Position(s) | Contents   |
|-----------------|--|
| 0               | Read access; indicates whether reads are allowed from the 512-GByte region controlled by this entry  |
| 1               | Write access; indicates whether writes are allowed from the 512-GByte region controlled by this entry  |
| 2               | If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 512-GByte region controlled by this entry<br>If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 512-GByte region controlled by this entry |

If that control is 0, this bit is ignored.   |
| 11              | Ignored  |
| (N-1):12        | Physical address of 4-KByte aligned EPT page-directory-pointer table referenced by this entry <sup>1</sup>   |
| 51:N            | Reserved (must be 0)   |
| 63:52           | Ignored  |

1. No processors supporting the Intel 64 architecture support more than 48 physical-address bits. Thus, no such processor can produce a guest-physical address with more than 48 bits. An attempt to use such an address causes a page fault. An attempt to load CR3 with such an address causes a general-protection fault. If PAE paging is being used, an attempt to load CR3 that would load a PDPTe with such an address causes a general-protection fault.

2. Future processors may include support for other EPT page-walk lengths. Software should read the VMX capability MSR IA32\_VMX\_EPT\_VPID\_CAP (see Appendix A.10) to determine what EPT page-walk lengths are supported.

**NOTES:**

1. N is the physical-address width supported by the processor. Software can determine a processor's physical-address width by executing CPUID with 80000008H in EAX. The physical-address width is returned in bits 7:0 of EAX.

- A 4-KByte naturally aligned EPT page-directory-pointer table is located at the physical address specified in bits 51:12 of the EPT PML4E. An EPT page-directory-pointer table comprises 512 64-bit entries (EPT PDPTEs). An EPT PDPTE is selected using the physical address defined as follows:
  - Bits 63:52 are all 0.
  - Bits 51:12 are from the EPT PML4E.
  - Bits 11:3 are bits 38:30 of the guest-physical address.
  - Bits 2:0 are all 0.

Because an EPT PDPTE is identified using bits 47:30 of the guest-physical address, it controls access to a 1-GByte region of the guest-physical-address space. Use of the EPT PDPTE depends on the value of bit 7 in that entry:<sup>1</sup>

- If bit 7 of the EPT PDPTE is 1, the EPT PDPTE maps a 1-GByte page. The final physical address is computed as follows:
  - Bits 63:52 are all 0.
  - Bits 51:30 are from the EPT PDPTE.
  - Bits 29:0 are from the original guest-physical address.

The format of an EPT PDPTE that maps a 1-GByte page is given in Table 28-2.

- If bit 7 of the EPT PDPTE is 0, a 4-KByte naturally aligned EPT page directory is located at the physical address specified in bits 51:12 of the EPT PDPTE. The format of an EPT PDPTE that references an EPT page directory is given in Table 28-3.

---

1. Not all processors allow bit 7 of an EPT PDPTE to be set to 1. Software should read the VMX capability MSR IA32\_VMX\_EPT\_VPID\_CAP (see Appendix A.10) to determine whether this is allowed.

**Table 28-2. Format of an EPT Page-Directory-Pointer-Table Entry (PDPTE) that Maps a 1-GByte Page**

| Bit Position(s) | Contents   |
|-----------------|--|
| 0               | Read access; indicates whether reads are allowed from the 1-GByte page referenced by this entry  |
| 1               | Write access; indicates whether writes are allowed from the 1-GByte page referenced by this entry  |
| 2               | If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 1-GByte page controlled by this entry<br>If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 1-GByte page controlled by this entry |
| 5:3             | EPT memory type for this 1-GByte page (see Section 28.2.6)   |
| 6               | Ignore PAT memory type for this 1-GByte page (see Section 28.2.6)  |
| 7               | Must be 1 (otherwise, this entry references an EPT page directory)   |
| 8               | If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 1-GByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0  |
| 9               | If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 1-GByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0   |
| 10              | Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 1-GByte page controlled by this entry. If that control is 0, this bit is ignored.   |
| 11              | Ignored  |
| 29:12           | Reserved (must be 0)   |
| (N-1):30        | Physical address of the 1-GByte page referenced by this entry <sup>1</sup>   |
| 51:N            | Reserved (must be 0)   |
| 62:52           | Ignored  |
| 63              | Suppress #VE. If the “EPT-violation #VE” VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 25.5.6.1). If “EPT-violation #VE” VM-execution control is 0, this bit is ignored.   |

**NOTES:**

1. N is the physical-address width supported by the logical processor.

**Table 28-3. Format of an EPT Page-Directory-Pointer-Table Entry (PDPTE) that References an EPT Page Directory**

| Bit Position(s) | Contents   |
|-----------------|--|
| 0               | Read access; indicates whether reads are allowed from the 1-GByte region controlled by this entry  |
| 1               | Write access; indicates whether writes are allowed from the 1-GByte region controlled by this entry  |
| 2               | If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 1-GByte region controlled by this entry<br>If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 1-GByte region controlled by this entry |
| 7:3             | Reserved (must be 0)   |
| 8               | If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 1-GByte region controlled by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0  |
| 9               | Ignored  |
| 10              | Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 1-GByte region controlled by this entry. If that control is 0, this bit is ignored.   |
| 11              | Ignored  |
| (N-1):12        | Physical address of 4-KByte aligned EPT page directory referenced by this entry <sup>1</sup>   |
| 51:N            | Reserved (must be 0)   |
| 63:52           | Ignored  |

**NOTES:**

1. N is the physical-address width supported by the logical processor.

An EPT page-directory comprises 512 64-bit entries (PDEs). An EPT PDE is selected using the physical address defined as follows:

- Bits 63:52 are all 0.
- Bits 51:12 are from the EPT PDPTE.
- Bits 11:3 are bits 29:21 of the guest-physical address.
- Bits 2:0 are all 0.

Because an EPT PDE is identified using bits 47:21 of the guest-physical address, it controls access to a 2-MByte region of the guest-physical-address space. Use of the EPT PDE depends on the value of bit 7 in that entry:

- If bit 7 of the EPT PDE is 1, the EPT PDE maps a 2-MByte page. The final physical address is computed as follows:
  - Bits 63:52 are all 0.
  - Bits 51:21 are from the EPT PDE.
  - Bits 20:0 are from the original guest-physical address.

The format of an EPT PDE that maps a 2-MByte page is given in Table 28-4.

- If bit 7 of the EPT PDE is 0, a 4-KByte naturally aligned EPT page table is located at the physical address specified in bits 51:12 of the EPT PDE. The format of an EPT PDE that references an EPT page table is given in Table 28-5.

An EPT page table comprises 512 64-bit entries (PTEs). An EPT PTE is selected using a physical address defined as follows:

- Bits 63:52 are all 0.

**Table 28-4. Format of an EPT Page-Directory Entry (PDE) that Maps a 2-MByte Page**

| Bit Position(s) | Contents   |
|-----------------|--|
| 0               | Read access; indicates whether reads are allowed from the 2-MByte page referenced by this entry  |
| 1               | Write access; indicates whether writes are allowed from the 2-MByte page referenced by this entry  |
| 2               | If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 2-MByte page controlled by this entry<br>If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 2-MByte page controlled by this entry |
| 5:3             | EPT memory type for this 2-MByte page (see Section 28.2.6)   |
| 6               | Ignore PAT memory type for this 2-MByte page (see Section 28.2.6)  |
| 7               | Must be 1 (otherwise, this entry references an EPT page table)   |
| 8               | If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 2-MByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0  |
| 9               | If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 2-MByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0   |
| 10              | Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 2-MByte page controlled by this entry. If that control is 0, this bit is ignored.   |
| 11              | Ignored  |
| 20:12           | Reserved (must be 0)   |
| (N-1):21        | Physical address of the 2-MByte page referenced by this entry <sup>1</sup>   |
| 51:N            | Reserved (must be 0)   |
| 62:52           | Ignored  |
| 63              | Suppress #VE. If the “EPT-violation #VE” VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 25.5.6.1). If “EPT-violation #VE” VM-execution control is 0, this bit is ignored.   |

**NOTES:**

1. N is the physical-address width supported by the logical processor.

- Bits 51:12 are from the EPT PDE.
- Bits 11:3 are bits 20:12 of the guest-physical address.
- Bits 2:0 are all 0.
- Because an EPT PTE is identified using bits 47:12 of the guest-physical address, every EPT PTE maps a 4-KByte page. The final physical address is computed as follows:
  - Bits 63:52 are all 0.
  - Bits 51:12 are from the EPT PTE.
  - Bits 11:0 are from the original guest-physical address.

The format of an EPT PTE is given in Table 28-6.

An EPT paging-structure entry is **present** if any of bits 2:0 is 1; otherwise, the entry is **not present**. The processor ignores bits 62:3 and uses the entry neither to reference another EPT paging-structure entry nor to produce a physical address. A reference using a guest-physical address whose translation encounters an EPT paging-struc-

ture that is not present causes an EPT violation (see Section 28.2.3.2). (If the “EPT-violation #VE” VM-execution control is 1, the EPT violation is convertible to a virtualization exception only if bit 63 is 0; see Section 25.5.6.1. If the “EPT-violation #VE” VM-execution control is 0, this bit is ignored.)

**Table 28-5. Format of an EPT Page-Directory Entry (PDE) that References an EPT Page Table**

| Bit Position(s) | Contents   |
|-----------------|--|
| 0               | Read access; indicates whether reads are allowed from the 2-MByte region controlled by this entry  |
| 1               | Write access; indicates whether writes are allowed from the 2-MByte region controlled by this entry  |
| 2               | If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 2-MByte region controlled by this entry<br>If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 2-MByte region controlled by this entry |
| 6:3             | Reserved (must be 0)   |
| 7               | Must be 0 (otherwise, this entry maps a 2-MByte page)  |
| 8               | If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 2-MByte region controlled by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0  |
| 9               | Ignored  |
| 10              | Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 2-MByte region controlled by this entry. If that control is 0, this bit is ignored.   |
| 11              | Ignored  |
| (N-1):12        | Physical address of 4-KByte aligned EPT page table referenced by this entry <sup>1</sup>   |
| 51:N            | Reserved (must be 0)   |
| 63:52           | Ignored  |

#### NOTES:

1. N is the physical-address width supported by the logical processor.

#### NOTE

If the “mode-based execute control for EPT” VM-execution control is 1, an EPT paging-structure entry is present if any of bits 2:0 or bit 10 is 1. If bits 2:0 are all 0 but bit 10 is 1, the entry is used normally to reference another EPT paging-structure entry or to produce a physical address.

The discussion above describes how the EPT paging structures reference each other and how the logical processor traverses those structures when translating a guest-physical address. It does not cover all details of the translation process. Additional details are provided as follows:

- Situations in which the translation process may lead to VM exits (sometimes before the process completes) are described in Section 28.2.3.
- Interactions between the EPT translation mechanism and memory typing are described in Section 28.2.6.

Figure 28-1 gives a summary of the formats of the EPTP and the EPT paging-structure entries. For the EPT paging structure entries, it identifies separately the format of entries that map pages, those that reference other EPT paging structures, and those that do neither because they are not present; bits 2:0 and bit 7 are highlighted because they determine how a paging-structure entry is used. (Figure 28-1 does not comprehend the fact that, if the “mode-based execute control for EPT” VM-execution control is 1, an entry is present if any of bits 2:0 or bit 10 is 1.)

## 28.2.3 EPT-Induced VM Exits

Accesses using guest-physical addresses may cause VM exits due to EPT misconfigurations, EPT violations, and page-modification log-full events. An **EPT misconfiguration** occurs when, in the course of translating a guest-physical address, the logical processor encounters an EPT paging-structure entry that contains an unsupported value (see Section 28.2.3.1). An **EPT violation** occurs when there is no EPT misconfiguration but the EPT paging-structure entries disallow an access using the guest-physical address (see Section 28.2.3.2). A **page-modifica-**

**Table 28-6. Format of an EPT Page-Table Entry that Maps a 4-KByte Page**

| Bit Position(s) | Contents   |
|-----------------|--|
| 0               | Read access; indicates whether reads are allowed from the 4-KByte page referenced by this entry  |
| 1               | Write access; indicates whether writes are allowed from the 4-KByte page referenced by this entry  |
| 2               | If the “mode-based execute control for EPT” VM-execution control is 0, execute access; indicates whether instruction fetches are allowed from the 4-KByte page controlled by this entry<br>If that control is 1, execute access for supervisor-mode linear addresses; indicates whether instruction fetches are allowed from supervisor-mode linear addresses in the 4-KByte page controlled by this entry |
| 5:3             | EPT memory type for this 4-KByte page (see Section 28.2.6)   |
| 6               | Ignore PAT memory type for this 4-KByte page (see Section 28.2.6)  |
| 7               | Ignored  |
| 8               | If bit 6 of EPTP is 1, accessed flag for EPT; indicates whether software has accessed the 4-KByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0  |
| 9               | If bit 6 of EPTP is 1, dirty flag for EPT; indicates whether software has written to the 4-KByte page referenced by this entry (see Section 28.2.4). Ignored if bit 6 of EPTP is 0   |
| 10              | Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 1, indicates whether instruction fetches are allowed from user-mode linear addresses in the 4-KByte page controlled by this entry. If that control is 0, this bit is ignored.   |
| 11              | Ignored  |
| (N-1):12        | Physical address of the 4-KByte page referenced by this entry <sup>1</sup>   |
| 51:N            | Reserved (must be 0)   |
| 62:52           | Ignored  |
| 63              | Suppress #VE. If the “EPT-violation #VE” VM-execution control is 1, EPT violations caused by accesses to this page are convertible to virtualization exceptions only if this bit is 0 (see Section 25.5.6.1). If “EPT-violation #VE” VM-execution control is 0, this bit is ignored.   |

### NOTES:

1. N is the physical-address width supported by the logical processor.

**tion log-full event** occurs when the logical processor determines a need to create a page-modification log entry and the current log is full (see Section 28.2.5).

These events occur only due to an attempt to access memory with a guest-physical address. Loading CR3 with a guest-physical address with the MOV to CR3 instruction can cause neither an EPT configuration nor an EPT violation until that address is used to access a paging structure.<sup>1</sup>

If the “EPT-violation #VE” VM-execution control is 1, certain EPT violations may cause virtualization exceptions instead of VM exits. See Section 25.5.6.1.

### 28.2.3.1 EPT Misconfigurations

An EPT misconfiguration occurs if translation of a guest-physical address encounters an EPT paging-structure that meets any of the following conditions:

- Bit 0 of the entry is clear (indicating that data reads are not allowed) and bit 1 is set (indicating that data writes are allowed).
- Either of the following if the processor does not support execute-only translations:
  - Bit 0 of the entry is clear (indicating that data reads are not allowed) and bit 2 is set (indicating that instruction fetches are allowed).<sup>1</sup>
  - The “mode-based execute control for EPT” VM-execution control is 1, bit 0 of the entry is clear (indicating that data reads are not allowed), and bit 10 is set (indicating that instruction fetches are allowed from user-mode linear addresses).

Software should read the VMX capability MSR `IA32_VMX_EPT_VPID_CAP` to determine whether execute-only translations are supported (see Appendix A.10).

- The entry is present (see Section 28.2.2) and one of the following holds:
  - A reserved bit is set. This includes the setting of a bit in the range 51:12 that is beyond the logical processor’s physical-address width.<sup>2</sup> See Section 28.2.2 for details of which bits are reserved in which EPT paging-structure entries.
  - The entry is the last one used to translate a guest physical address (either an EPT PDE with bit 7 set to 1 or an EPT PTE) and the value of bits 5:3 (EPT memory type) is 2, 3, or 7 (these values are reserved).

EPT misconfigurations result when an EPT paging-structure entry is configured with settings reserved for future functionality. Software developers should be aware that such settings may be used in the future and that an EPT paging-structure entry that causes an EPT misconfiguration on one processor might not do so in the future.

### 28.2.3.2 EPT Violations

An EPT violation may occur during an access using a guest-physical address whose translation does not cause an EPT misconfiguration. An EPT violation occurs in any of the following situations:

- Translation of the guest-physical address encounters an EPT paging-structure entry that is not present (see Section 28.2.2).
- The access is a data read and, for any byte to be read, bit 0 (read access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte. Reads by the logical processor of guest paging structures to translate a linear address are considered to be data reads.

---

1. If the logical processor is using PAE paging—because `CR0.PG = CR4.PAE = 1` and `IA32_EFER.LMA = 0`—the `MOV to CR3` instruction loads the PDPTs from memory using the guest-physical address being loaded into CR3. In this case, therefore, the `MOV to CR3` instruction may cause an EPT misconfiguration, an EPT violation, or a page-modification log-full event.

1. If the “mode-based execute control for EPT” VM-execution control is 1, setting bit 2 indicates that instruction fetches are allowed from supervisor-mode linear addresses.

2. Software can determine a processor’s physical-address width by executing `CPUID` with `80000008H` in EAX. The physical-address width is returned in bits 7:0 of EAX.

[illegible]

Figure 28-1. Formats of EPTP and EPT Paging-Structure Entries

**NOTES:**

1. M is an abbreviation for MAXPHYADDR.
  2. See Section 24.6.11 for details of the EPTP.
  3. Execute access for user-mode linear addresses. If the “mode-based execute control for EPT” VM-execution control is 0, this bit is ignored.
  4. Execute access. If the “mode-based execute control for EPT” VM-execution control is 1, this bit controls execute access for supervisor-mode linear addresses.
  5. If the “mode-based execute control for EPT” VM-execution control is 1, an EPT paging-structure entry is present if any of bits 2:0 or bit 10 is 1. This table does not comprehend that fact.
  6. Suppress #VE. If the “EPT-violation #VE” VM-execution control is 0, this bit is ignored.
- The access is a data write, for any byte to be written, bit 1 (write access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte. Writes by the logical processor to guest paging structures to update accessed and dirty flags are considered to be data writes.  
If bit 6 of the EPT pointer (EPTP) is 1 (enabling accessed and dirty flags for EPT), processor accesses to guest paging-structure entries are treated as writes with regard to EPT violations. Thus, if bit 1 is clear in any of the

EPT paging-structure entries used to translate the guest-physical address of a guest paging-structure entry, an attempt to use that entry to translate a linear address causes an EPT violation.

(This does not apply to loads of the PDPTE registers by the MOV to CR instruction for PAE paging; see Section 4.4.1. Those loads of guest PDPTEs are treated as reads and do not cause EPT violations due to a guest-physical address not being writable.)

- The access is an instruction fetch and the EPT paging structures prevent execute access to any of the bytes being fetched. Whether this occurs depends upon the setting of the “mode-based execute control for EPT” VM-execution control:
  - If the control is 0, an instruction fetch from a byte is prevented if bit 2 (execute access) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.
  - If the control is 1, an instruction fetch from a byte is prevented in either of the following cases:
    - Paging maps the linear address of the byte as a supervisor-mode address and bit 2 (execute access for supervisor-mode linear addresses) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.  
Paging maps a linear address as a supervisor-mode address if the U/S flag (bit 2) is 0 in at least one of the paging-structure entries controlling the translation of the linear address.
    - Paging maps the linear address of the byte as a user-mode address and bit 10 (execute access for user-mode linear addresses) was clear in any of the EPT paging-structure entries used to translate the guest-physical address of the byte.  
Paging maps a linear address as a user-mode address if the U/S flag is 1 in all of the paging-structure entries controlling the translation of the linear address. If paging is disabled (CR0.PG = 0), every linear address is a user-mode address.

### 28.2.3.3 Prioritization of EPT Misconfigurations and EPT Violations

The translation of a linear address to a physical address requires one or more translations of guest-physical addresses using EPT (see Section 28.2.1). This section specifies the relative priority of EPT-induced VM exits with respect to each other and to other events that may be encountered when accessing memory using a linear address.

For an access to a guest-physical address, determination of whether an EPT misconfiguration or an EPT violation occurs is based on an iterative process:<sup>1</sup>

1. An EPT paging-structure entry is read (initially, this is an EPT PML4 entry):
  - a. If the entry is not present (see Section 28.2.2), an EPT violation occurs.
  - b. If the entry is present but its contents are not configured properly (see Section 28.2.3.1), an EPT misconfiguration occurs.
  - c. If the entry is present and its contents are configured properly, operation depends on whether the entry references another EPT paging structure (whether it is an EPT PDE with bit 7 set to 1 or an EPT PTE):
    - i) If the entry does reference another EPT paging structure, an entry from that structure is accessed; step 1 is executed for that other entry.
    - ii) Otherwise, the entry is used to produce the ultimate physical address (the translation of the original guest-physical address); step 2 is executed.
2. Once the ultimate physical address is determined, the privileges determined by the EPT paging-structure entries are evaluated:
  - a. If the access to the guest-physical address is not allowed by these privileges (see Section 28.2.3.2), an EPT violation occurs.
  - b. If the access to the guest-physical address is allowed by these privileges, memory is accessed using the ultimate physical address.

If CR0.PG = 1, the translation of a linear address is also an iterative process, with the processor first accessing an entry in the guest paging structure referenced by the guest-physical address in CR3 (or, if PAE paging is in use, the

1. This is a simplification of the more detailed description given in Section 28.2.2.

guest-physical address in the appropriate PDPT register), then accessing an entry in another guest paging structure referenced by the guest-physical address in the first guest paging-structure entry, etc. Each guest-physical address is itself translated using EPT and may cause an EPT-induced VM exit. The following items detail how page faults and EPT-induced VM exits are recognized during this iterative process:

1. An attempt is made to access a guest paging-structure entry with a guest-physical address (initially, the address in CR3 or PDPT register).
  - a. If the access fails because of an EPT misconfiguration or an EPT violation (see above), an EPT-induced VM exit occurs.
  - b. If the access does not cause an EPT-induced VM exit, bit 0 (the present flag) of the entry is consulted:
    - i) If the present flag is 0 or any reserved bit is set, a page fault occurs.
    - ii) If the present flag is 1, no reserved bit is set, operation depends on whether the entry references another guest paging structure (whether it is a guest PDE with PS = 1 or a guest PTE):
      - If the entry does reference another guest paging structure, an entry from that structure is accessed; step 1 is executed for that other entry.
      - Otherwise, the entry is used to produce the ultimate guest-physical address (the translation of the original linear address); step 2 is executed.
2. Once the ultimate guest-physical address is determined, the privileges determined by the guest paging-structure entries are evaluated:
  - a. If the access to the linear address is not allowed by these privileges (e.g., it was a write to a read-only page), a page fault occurs.
  - b. If the access to the linear address is allowed by these privileges, an attempt is made to access memory at the ultimate guest-physical address:
    - i) If the access fails because of an EPT misconfiguration or an EPT violation (see above), an EPT-induced VM exit occurs.
    - ii) If the access does not cause an EPT-induced VM exit, memory is accessed using the ultimate physical address (the translation, using EPT, of the ultimate guest-physical address).

If CR0.PG = 0, a linear address is treated as a guest-physical address and is translated using EPT (see above). This process, if it completes without an EPT violation or EPT misconfiguration, produces a physical address and determines the privileges allowed by the EPT paging-structure entries. If these privileges do not allow the access to the physical address (see Section 28.2.3.2), an EPT violation occurs. Otherwise, memory is accessed using the physical address.

## 28.2.4 Accessed and Dirty Flags for EPT

The Intel 64 architecture supports **accessed and dirty flags** in ordinary paging-structure entries (see Section 4.8). Some processors also support corresponding flags in EPT paging-structure entries. Software should read the VMX capability MSR IA32\_VMX\_EPT\_VPID\_CAP (see Appendix A.10) to determine whether the processor supports this feature.

Software can enable accessed and dirty flags for EPT using bit 6 of the extended-page-table pointer (EPTP), a VM-execution control field (see Table 24-8 in Section 24.6.11). If this bit is 1, the processor will set the accessed and dirty flags for EPT as described below. In addition, setting this flag causes processor accesses to guest paging-structure entries to be treated as writes (see below and Section 28.2.3.2).

For any EPT paging-structure entry that is used during guest-physical-address translation, bit 8 is the accessed flag. For a EPT paging-structure entry that maps a page (as opposed to referencing another EPT paging structure), bit 9 is the dirty flag.

Whenever the processor uses an EPT paging-structure entry as part of guest-physical-address translation, it sets the accessed flag in that entry (if it is not already set).

Whenever there is a write to a guest-physical address, the processor sets the dirty flag (if it is not already set) in the EPT paging-structure entry that identifies the final physical address for the guest-physical address (either an EPT PTE or an EPT paging-structure entry in which bit 7 is 1).

When accessed and dirty flags for EPT are enabled, processor accesses to guest paging-structure entries are treated as writes (see Section 28.2.3.2). Thus, such an access will cause the processor to set the dirty flag in the EPT paging-structure entry that identifies the final physical address of the guest paging-structure entry.

(This does not apply to loads of the PDPT registers for PAE paging by the MOV to CR instruction; see Section 4.4.1. Those loads of guest PDPTes are treated as reads and do not cause the processor to set the dirty flag in any EPT paging-structure entry.)

These flags are “sticky,” meaning that, once set, the processor does not clear them; only software can clear them.

A processor may cache information from the EPT paging-structure entries in TLBs and paging-structure caches (see Section 28.3). This fact implies that, if software changes an accessed flag or a dirty flag from 1 to 0, the processor might not set the corresponding bit in memory on a subsequent access using an affected guest-physical address.

## 28.2.5 Page-Modification Logging

When accessed and dirty flags for EPT are enabled, software can track writes to guest-physical addresses using a feature called **page-modification logging**.

Software can enable page-modification logging by setting the “enable PML” VM-execution control (see Table 24-7 in Section 24.6.2). When this control is 1, the processor adds entries to the **page-modification log** as described below. The page-modification log is a 4-KByte region of memory located at the physical address in the PML address VM-execution control field. The page-modification log consists of 512 64-bit entries; the PML index VM-execution control field indicates the next entry to use.

Before allowing a guest-physical access, the processor may determine that it first needs to set an accessed or dirty flag for EPT (see Section 28.2.4). When this happens, the processor examines the PML index. If the PML index is not in the range 0–511, there is a **page-modification log-full** event and a VM exit occurs. In this case, the accessed or dirty flag is not set, and the guest-physical access that triggered the event does not occur.

If instead the PML index is in the range 0–511, the processor proceeds to update accessed or dirty flags for EPT as described in Section 28.2.4. If the processor updated a dirty flag for EPT (changing it from 0 to 1), it then operates as follows:

1. The guest-physical address of the access is written to the page-modification log. Specifically, the guest-physical address is written to physical address determined by adding 8 times the PML index to the PML address. Bits 11:0 of the value written are always 0 (the guest-physical address written is thus 4-KByte aligned).
2. The PML index is decremented by 1 (this may cause the value to transition from 0 to FFFFH).

Because the processor decrements the PML index with each log entry, the value may transition from 0 to FFFFH. At that point, no further logging will occur, as the processor will determine that the PML index is not in the range 0–511 and will generate a page-modification log-full event (see above).

## 28.2.6 EPT and Memory Typing

This section specifies how a logical processor determines the memory type use for a memory access while EPT is in use. (See Chapter 11, “Memory Cache Control” of *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A* for details of memory typing in the Intel 64 architecture.) Section 28.2.6.1 explains how the memory type is determined for accesses to the EPT paging structures. Section 28.2.6.2 explains how the memory type is determined for an access using a guest-physical address that is translated using EPT.

### 28.2.6.1 Memory Type Used for Accessing EPT Paging Structures

This section explains how the memory type is determined for accesses to the EPT paging structures. The determination is based first on the value of bit 30 (cache disable—CD) in control register CR0:

- If CR0.CD = 0, the memory type used for any such reference is the EPT paging-structure memory type, which is specified in bits 2:0 of the extended-page-table pointer (EPTP), a VM-execution control field (see Section 24.6.11). A value of 0 indicates the uncacheable type (UC), while a value of 6 indicates the write-back type (WB). Other values are reserved.
- If CR0.CD = 1, the memory type used for any such reference is uncacheable (UC).

The MTRRs have no effect on the memory type used for an access to an EPT paging structure.

### 28.2.6.2 Memory Type Used for Translated Guest-Physical Addresses

The effective memory type of a memory access using a guest-physical address (an access that is translated using EPT) is the memory type that is used to access memory. The effective memory type is based on the value of bit 30 (cache disable—CD) in control register CR0; the last EPT paging-structure entry used to translate the guest-physical address (either an EPT PDE with bit 7 set to 1 or an EPT PTE); and the PAT memory type (see below):

- The PAT memory type depends on the value of CR0.PG:
  - If CR0.PG = 0, the PAT memory type is WB (writeback).<sup>1</sup>
  - If CR0.PG = 1, the PAT memory type is the memory type selected from the IA32\_PAT MSR as specified in Section 11.12.3, “Selecting a Memory Type from the PAT”.<sup>2</sup>
- The EPT memory type is specified in bits 5:3 of the last EPT paging-structure entry: 0 = UC; 1 = WC; 4 = WT; 5 = WP; and 6 = WB. Other values are reserved and cause EPT misconfigurations (see Section 28.2.3).
- If CR0.CD = 0, the effective memory type depends upon the value of bit 6 of the last EPT paging-structure entry:
  - If the value is 0, the effective memory type is the combination of the EPT memory type and the PAT memory type specified in Table 11-7 in Section 11.5.2.2, using the EPT memory type in place of the MTRR memory type.
  - If the value is 1, the memory type used for the access is the EPT memory type. The PAT memory type is ignored.
- If CR0.CD = 1, the effective memory type is UC.

The MTRRs have no effect on the memory type used for an access to a guest-physical address.

## 28.3 CACHING TRANSLATION INFORMATION

Processors supporting Intel® 64 and IA-32 architectures may accelerate the address-translation process by caching on the processor data from the structures in memory that control that process. Such caching is discussed in Section 4.10, “Caching Translation Information” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*. The current section describes how this caching interacts with the VMX architecture.

The VPID and EPT features of the architecture for VMX operation augment this caching architecture. EPT defines the guest-physical address space and defines translations to that address space (from the linear-address space) and from that address space (to the physical-address space). Both features control the ways in which a logical processor may create and use information cached from the paging structures.

Section 28.3.1 describes the different kinds of information that may be cached. Section 28.3.2 specifies when such information may be cached and how it may be used. Section 28.3.3 details how software can invalidate cached information.

### 28.3.1 Information That May Be Cached

Section 4.10, “Caching Translation Information” in *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A* identifies two kinds of translation-related information that may be cached by a logical

1. If the capability MSR IA32\_VMX\_CR0\_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG can be 0 in VMX non-root operation only if the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
2. Table 11-11 in Section 11.12.3, “Selecting a Memory Type from the PAT” illustrates how the PAT memory type is selected based on the values of the PAT, PCD, and PWT bits in a page-table entry (or page-directory entry with PS = 1). For accesses to a guest paging-structure entry X, the PAT memory type is selected from the table by using a value of 0 for the PAT bit with the values of PCD and PWT from the paging-structure entry Y that references X (or from CR3 if X is in the root paging structure). With PAE paging, the PAT memory type for accesses to the PDPTes is WB.

processor: **translations**, which are mappings from linear page numbers to physical page frames, and **paging-structure caches**, which map the upper bits of a linear page number to information from the paging-structure entries used to translate linear addresses matching those upper bits.

The same kinds of information may be cached when VPIDs and EPT are in use. A logical processor may cache and use such information based on its function. Information with different functionality is identified as follows:

- **Linear mappings.**<sup>1</sup> There are two kinds:
  - Linear translations. Each of these is a mapping from a linear page number to the physical page frame to which it translates, along with information about access privileges and memory typing.
  - Linear paging-structure-cache entries. Each of these is a mapping from the upper portion of a linear address to the physical address of the paging structure used to translate the corresponding region of the linear-address space, along with information about access privileges. For example, bits 47:39 of a linear address would map to the address of the relevant page-directory-pointer table.

Linear mappings do not contain information from any EPT paging structure.

- **Guest-physical mappings.**<sup>2</sup> There are two kinds:
  - Guest-physical translations. Each of these is a mapping from a guest-physical page number to the physical page frame to which it translates, along with information about access privileges and memory typing.
  - Guest-physical paging-structure-cache entries. Each of these is a mapping from the upper portion of a guest-physical address to the physical address of the EPT paging structure used to translate the corresponding region of the guest-physical address space, along with information about access privileges.

The information in guest-physical mappings about access privileges and memory typing is derived from EPT paging structures.

- **Combined mappings.**<sup>3</sup> There are two kinds:
  - Combined translations. Each of these is a mapping from a linear page number to the physical page frame to which it translates, along with information about access privileges and memory typing.
  - Combined paging-structure-cache entries. Each of these is a mapping from the upper portion of a linear address to the physical address of the paging structure used to translate the corresponding region of the linear-address space, along with information about access privileges.

The information in combined mappings about access privileges and memory typing is derived from both guest paging structures and EPT paging structures.

### 28.3.2 Creating and Using Cached Translation Information

The following items detail the creation of the mappings described in the previous section:<sup>4</sup>

- The following items describe the creation of mappings while EPT is not in use (including execution outside VMX non-root operation):
  - Linear mappings may be created. They are derived from the paging structures referenced (directly or indirectly) by the current value of CR3 and are associated with the current VPID and the current PCID.
  - No linear mappings are created with information derived from paging-structure entries that are not present (bit 0 is 0) or that set reserved bits. For example, if a PTE is not present, no linear mapping are created for any linear page number whose translation would use that PTE.
  - No guest-physical or combined mappings are created while EPT is not in use.
- The following items describe the creation of mappings while EPT is in use:

---

1. Earlier versions of this manual used the term “VPID-tagged” to identify linear mappings.

2. Earlier versions of this manual used the term “EPTP-tagged” to identify guest-physical mappings.

3. Earlier versions of this manual used the term “dual-tagged” to identify combined mappings.

4. This section associated cached information with the current VPID and PCID. If PCIDs are not supported or are not being used (e.g., because CR4.PCIDE = 0), all the information is implicitly associated with PCID 000H; see Section 4.10.1, “Process-Context Identifiers (PCIDs),” in *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*.

- Guest-physical mappings may be created. They are derived from the EPT paging structures referenced (directly or indirectly) by bits 51:12 of the current EPTP. These 40 bits contain the address of the EPT-PML4-table. (the notation EP4TA refers to those 40 bits). Newly created guest-physical mappings are associated with the current EP4TA.
- Combined mappings may be created. They are derived from the EPT paging structures referenced (directly or indirectly) by the current EP4TA. If CR0.PG = 1, they are also derived from the paging structures referenced (directly or indirectly) by the current value of CR3. They are associated with the current VPID, the current PCID, and the current EP4TA.<sup>1</sup> No combined paging-structure-cache entries are created if CR0.PG = 0.<sup>2</sup>
- No guest-physical mappings or combined mappings are created with information derived from EPT paging-structure entries that are not present (see Section 28.2.2) or that are misconfigured (see Section 28.2.3.1).
- No combined mappings are created with information derived from guest paging-structure entries that are not present or that set reserved bits.
- No linear mappings are created while EPT is in use.

The following items detail the use of the various mappings:

- If EPT is not in use (e.g., when outside VMX non-root operation), a logical processor may use cached mappings as follows:
  - For accesses using linear addresses, it may use linear mappings associated with the current VPID and the current PCID. It may also use global TLB entries (linear mappings) associated with the current VPID and any PCID.
  - No guest-physical or combined mappings are used while EPT is not in use.
- If EPT is in use, a logical processor may use cached mappings as follows:
  - For accesses using linear addresses, it may use combined mappings associated with the current VPID, the current PCID, and the current EP4TA. It may also use global TLB entries (combined mappings) associated with the current VPID, the current EP4TA, and any PCID.
  - For accesses using guest-physical addresses, it may use guest-physical mappings associated with the current EP4TA.
  - No linear mappings are used while EPT is in use.

### 28.3.3 Invalidating Cached Translation Information

Software modifications of paging structures (including EPT paging structures) may result in inconsistencies between those structures and the mappings cached by a logical processor. Certain operations invalidate information cached by a logical processor and can be used to eliminate such inconsistencies.

#### 28.3.3.1 Operations that Invalidate Cached Mappings

The following operations invalidate cached mappings as indicated:

- Operations that architecturally invalidate entries in the TLBs or paging-structure caches independent of VMX operation (e.g., the INVLPG and INVPCID instructions) invalidate linear mappings and combined mappings.<sup>3</sup> They are required to do so only for the current VPID (but, for combined mappings, all EP4TAs). Linear

- 
1. At any given time, a logical processor may be caching combined mappings for a VPID and a PCID that are associated with different EP4TAs. Similarly, it may be caching combined mappings for an EP4TA that are associated with different VPIDs and PCIDs.
  2. If the capability MSR IA32\_VMX\_CR0\_FIXED0 reports that CR0.PG must be 1 in VMX operation, CR0.PG can be 0 in VMX non-root operation only if the “unrestricted guest” VM-execution control and bit 31 of the primary processor-based VM-execution controls are both 1.
  3. See Section 4.10.4, “Invalidation of TLBs and Paging-Structure Caches,” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A* for an enumeration of operations that architecturally invalidate entries in the TLBs and paging-structure caches independent of VMX operation.

mappings for the current VPID are invalidated even if EPT is in use.<sup>1</sup> Combined mappings for the current VPID are invalidated even if EPT is not in use.<sup>2</sup>

- An EPT violation invalidates any guest-physical mappings (associated with the current EP4TA) that would be used to translate the guest-physical address that caused the EPT violation. If that guest-physical address was the translation of a linear address, the EPT violation also invalidates any combined mappings for that linear address associated with the current PCID, the current VPID and the current EP4TA.
- If the “enable VPID” VM-execution control is 0, VM entries and VM exits invalidate linear mappings and combined mappings associated with VPID 0000H (for all PCIDs). Combined mappings for VPID 0000H are invalidated for all EP4TAs.
- Execution of the INVVPID instruction invalidates linear mappings and combined mappings. Invalidation is based on instruction operands, called the INVVPID type and the INVVPID descriptor. Four INVVPID types are currently defined:
  - **Individual-address.** If the INVVPID type is 0, the logical processor invalidates linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor and that would be used to translate the linear address specified in of the INVVPID descriptor. Linear mappings and combined mappings for that VPID and linear address are invalidated for all PCIDs and, for combined mappings, all EP4TAs. (The instruction may also invalidate mappings associated with other VPIDs and for other linear addresses.)
  - **Single-context.** If the INVVPID type is 1, the logical processor invalidates all linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor. Linear mappings and combined mappings for that VPID are invalidated for all PCIDs and, for combined mappings, all EP4TAs. (The instruction may also invalidate mappings associated with other VPIDs.)
  - **All-context.** If the INVVPID type is 2, the logical processor invalidates linear mappings and combined mappings associated with all VPIDs except VPID 0000H and with all PCIDs. (The instruction may also invalidate linear mappings with VPID 0000H.) Combined mappings are invalidated for all EP4TAs.
  - **Single-context-retaining-globals.** If the INVVPID type is 3, the logical processor invalidates linear mappings and combined mappings associated with the VPID specified in the INVVPID descriptor. Linear mappings and combined mappings for that VPID are invalidated for all PCIDs and, for combined mappings, all EP4TAs. The logical processor is **not** required to invalidate information that was used for **global** translations (although it may do so). See Section 4.10, “Caching Translation Information” for details regarding global translations. (The instruction may also invalidate mappings associated with other VPIDs.)

See Chapter 30 for details of the INVVPID instruction. See Section 28.3.3.3 for guidelines regarding use of this instruction.

- Execution of the INVEPT instruction invalidates guest-physical mappings and combined mappings. Invalidation is based on instruction operands, called the INVEPT type and the INVEPT descriptor. Two INVEPT types are currently defined:
  - **Single-context.** If the INVEPT type is 1, the logical processor invalidates all guest-physical mappings and combined mappings associated with the EP4TA specified in the INVEPT descriptor. Combined mappings for that EP4TA are invalidated for all VPIDs and all PCIDs. (The instruction may invalidate mappings associated with other EP4TAs.)
  - **All-context.** If the INVEPT type is 2, the logical processor invalidates guest-physical mappings and combined mappings associated with all EP4TAs (and, for combined mappings, for all VPIDs and PCIDs).

See Chapter 30 for details of the INVEPT instruction. See Section 28.3.3.4 for guidelines regarding use of this instruction.

- A power-up or a reset invalidates all linear mappings, guest-physical mappings, and combined mappings.

---

1. While no linear mappings are created while EPT is in use, a logical processor may retain, while EPT is in use, linear mappings (for the same VPID as the current one) there were created earlier, when EPT was not in use.

2. While no combined mappings are created while EPT is not in use, a logical processor may retain, while EPT is in not use, combined mappings (for the same VPID as the current one) there were created earlier, when EPT was in use.

### 28.3.3.2 Operations that Need Not Invalidate Cached Mappings

The following items detail cases of operations that are not required to invalidate certain cached mappings:

- Operations that architecturally invalidate entries in the TLBs or paging-structure caches independent of VMX operation are not required to invalidate any guest-physical mappings.
- The INVVPID instruction is not required to invalidate any guest-physical mappings.
- The INVEPT instruction is not required to invalidate any linear mappings.
- VMX transitions are not required to invalidate any guest-physical mappings. If the “enable VPID” VM-execution control is 1, VMX transitions are not required to invalidate any linear mappings or combined mappings.
- The VMXOFF and VMXON instructions are not required to invalidate any linear mappings, guest-physical mappings, or combined mappings.

A logical processor may invalidate any cached mappings at any time. For this reason, the operations identified above may invalidate the indicated mappings despite the fact that doing so is not required.

### 28.3.3.3 Guidelines for Use of the INVVPID Instruction

The need for VMM software to use the INVVPID instruction depends on how that software is virtualizing memory (e.g., see Section 32.3, “Memory Virtualization”).

If EPT is not in use, it is likely that the VMM is virtualizing the guest paging structures. Such a VMM may configure the VMCS so that all or some of the operations that invalidate entries the TLBs and the paging-structure caches (e.g., the INVLPG instruction) cause VM exits. If VMM software is emulating these operations, it may be necessary to use the INVVPID instruction to ensure that the logical processor’s TLBs and the paging-structure caches are appropriately invalidated.

Requirements of when software should use the INVVPID instruction depend on the specific algorithm being used for page-table virtualization. The following items provide guidelines for software developers:

- Emulation of the INVLPG instruction may require execution of the INVVPID instruction as follows:
  - The INVVPID type is individual-address (0).
  - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.
  - The linear address in the INVVPID descriptor is that of the operand of the INVLPG instruction being emulated.
- Some instructions invalidate all entries in the TLBs and paging-structure caches—except for global translations. An example is the MOV to CR3 instruction. (See Section 4.10, “Caching Translation Information” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A* for details regarding global translations.) Emulation of such an instruction may require execution of the INVVPID instruction as follows:
  - The INVVPID type is single-context-retaining-globals (3).
  - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.
- Some instructions invalidate all entries in the TLBs and paging-structure caches—including for global translations. An example is the MOV to CR4 instruction if the value of value of bit 4 (page global enable—PGE) is changing. Emulation of such an instruction may require execution of the INVVPID instruction as follows:
  - The INVVPID type is single-context (1).
  - The VPID in the INVVPID descriptor is the one assigned to the virtual processor whose execution is being emulated.

If EPT is not in use, the logical processor associates all mappings it creates with the current VPID, and it will use such mappings to translate linear addresses. For that reason, a VMM should not use the same VPID for different non-EPT guests that use different page tables. Doing so may result in one guest using translations that pertain to the other.

If EPT is in use, the instructions enumerated above might not be configured to cause VM exits and the VMM might not be emulating them. In that case, executions of the instructions by guest software properly invalidate the

required entries in the TLBs and paging-structure caches (see Section 28.3.3.1); execution of the INVVPID instruction is not required.

If EPT is in use, the logical processor associates all mappings it creates with the value of bits 51:12 of current EPTP. If a VMM uses different EPTP values for different guests, it may use the same VPID for those guests. Doing so cannot result in one guest using translations that pertain to the other.

The following guidelines apply more generally and are appropriate even if EPT is in use:

- As detailed in Section 29.4.5, an access to the APIC-access page might not cause an APIC-access VM exit if software does not properly invalidate information that may be cached from the paging structures. If, at one time, the current VPID on a logical processor was a non-zero value X, it is recommended that software use the INVVPID instruction with the “single-context” INVVPID type and with VPID X in the INVVPID descriptor before a VM entry on the same logical processor that establishes VPID X and either (a) the “virtualize APIC accesses” VM-execution control was changed from 0 to 1; or (b) the value of the APIC-access address was changed.
- Software can use the INVVPID instruction with the “all-context” INVVPID type immediately after execution of the VMXON instruction or immediately prior to execution of the VMXOFF instruction. Either prevents potentially undesired retention of information cached from paging structures between separate uses of VMX operation.

### 28.3.3.4 Guidelines for Use of the INVEPT Instruction

The following items provide guidelines for use of the INVEPT instruction to invalidate information cached from the EPT paging structures.

- Software should use the INVEPT instruction with the “single-context” INVEPT type after making any of the following changes to an EPT paging-structure entry (the INVEPT descriptor should contain an EPTP value that references — directly or indirectly — the modified EPT paging structure):
  - Changing any of the privilege bits 2:0 from 1 to 0.<sup>1</sup>
  - Changing the physical address in bits 51:12.
  - Clearing bit 8 (the accessed flag) if accessed and dirty flags for EPT will be enabled.
  - For an EPT PDPTE or an EPT PDE, changing bit 7 (which determines whether the entry maps a page).
  - For the last EPT paging-structure entry used to translate a guest-physical address (an EPT PDPTE with bit 7 set to 1, an EPT PDE with bit 7 set to 1, or an EPT PTE), changing either bits 5:3 or bit 6. (These bits determine the effective memory type of accesses using that EPT paging-structure entry; see Section 28.2.6.)
  - For the last EPT paging-structure entry used to translate a guest-physical address (an EPT PDPTE with bit 7 set to 1, an EPT PDE with bit 7 set to 1, or an EPT PTE), clearing bit 9 (the dirty flag) if accessed and dirty flags for EPT will be enabled.
- Software should use the INVEPT instruction with the “single-context” INVEPT type before a VM entry with an EPTP value X such that  $X[6] = 1$  (accessed and dirty flags for EPT are enabled) if the logical processor had earlier been in VMX non-root operation with an EPTP value Y such that  $Y[6] = 0$  (accessed and dirty flags for EPT are not enabled) and  $Y[51:12] = X[51:12]$ .
- Software may use the INVEPT instruction after modifying a present EPT paging-structure entry (see Section 28.2.2) to change any of the privilege bits 2:0 from 0 to 1.<sup>2</sup> Failure to do so may cause an EPT violation that would not otherwise occur. Because an EPT violation invalidates any mappings that would be used by the access that caused the EPT violation (see Section 28.3.3.1), an EPT violation will not recur if the original access is performed again, even if the INVEPT instruction is not executed.
- Because a logical processor does not cache any information derived from EPT paging-structure entries that are not present (see Section 28.2.2) or misconfigured (see Section 28.2.3.1), it is not necessary to execute INVEPT following modification of an EPT paging-structure entry that had been not present or misconfigured.

1. If the “mode-based execute control for EPT” VM-execution control is 1, software should use the INVEPT instruction after changing privilege bit 10 from 1 to 0.

2. If the “mode-based execute control for EPT” VM-execution control is 1, software may use the INVEPT instruction after modifying a present EPT paging-structure entry to change privilege bit 10 from 0 to 1.

- As detailed in Section 29.4.5, an access to the APIC-access page might not cause an APIC-access VM exit if software does not properly invalidate information that may be cached from the EPT paging structures. If EPT was in use on a logical processor at one time with EPTP X, it is recommended that software use the INVEPT instruction with the “single-context” INVEPT type and with EPTP X in the INVEPT descriptor before a VM entry on the same logical processor that enables EPT with EPTP X and either (a) the “virtualize APIC accesses” VM-execution control was changed from 0 to 1; or (b) the value of the APIC-access address was changed.
- Software can use the INVEPT instruction with the “all-context” INVEPT type immediately after execution of the VMXON instruction or immediately prior to execution of the VMXOFF instruction. Either prevents potentially undesired retention of information cached from EPT paging structures between separate uses of VMX operation.

In a system containing more than one logical processor, software must account for the fact that information from an EPT paging-structure entry may be cached on logical processors other than the one that modifies that entry. The process of propagating the changes to a paging-structure entry is commonly referred to as “TLB shutdown.” A discussion of TLB shutdown appears in Section 4.10.5, “Propagation of Paging-Structure Changes to Multiple Processors,” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3A*.

Changes to this chapter: Various updates related to VMX and Intel Processor Trace interactions. Various minor corrections throughout chapter.

## CHAPTER 35

# INTEL® PROCESSOR TRACE

---

### 35.1 OVERVIEW

Intel® Processor Trace (Intel PT) is an extension of Intel® Architecture that captures information about software execution using dedicated hardware facilities that cause only minimal performance perturbation to the software being traced. This information is collected in data packets. The initial implementations of Intel PT offer **control flow tracing**, which generates a variety of packets to be processed by a software decoder. The packets include timing, program flow information (e.g. branch targets, branch taken/not taken indications) and program-induced mode related information (e.g. Intel TSX state transitions, CR3 changes). These packets may be buffered internally before being sent to the memory subsystem or other output mechanism available in the platform. Debug software can process the trace data and reconstruct the program flow.

Later generations include additional trace sources, including software trace instrumentation using PTWRITE, and Power Event tracing.

#### 35.1.1 Features and Capabilities

Intel PT's control flow trace generates a variety of packets that, when combined with the binaries of a program by a post-processing tool, can be used to produce an exact execution trace. The packets record flow information such as instruction pointers (IP), indirect branch targets, and directions of conditional branches within contiguous code regions (basic blocks).

Intel PT can also be configured to log software-generated packets using PTWRITE, and packets describing processor power management events.

In addition, the packets record other contextual, timing, and bookkeeping information that enables both functional and performance debugging of applications. Intel PT has several control and filtering capabilities available to customize the tracing information collected and to append other processor state and timing information to enable debugging. For example, there are modes that allow packets to be filtered based on the current privilege level (CPL) or the value of CR3.

Configuration of the packet generation and filtering capabilities are programmed via a set of MSRs. The MSRs generally follow the naming convention of IA32\_RTIT\_\*. The capability provided by these configuration MSRs are enumerated by CPUID, see Section 35.3. Details of the MSRs for configuring Intel PT are described in Section 35.2.7.

##### 35.1.1.1 Packet Summary

After a tracing tool has enabled and configured the appropriate MSRs, the processor will collect and generate trace information in the following categories of packets (for more details on the packets, see Section 35.4):

- Packets about basic information on program execution; these include:
  - Packet Stream Boundary (PSB) packets: PSB packets act as 'heartbeats' that are generated at regular intervals (e.g., every 4K trace packet bytes). These packets allow the packet decoder to find the packet boundaries within the output data stream; a PSB packet should be the first packet that a decoder looks for when beginning to decode a trace.
  - Paging Information Packet (PIP): PIPs record modifications made to the CR3 register. This information, along with information from the operating system on the CR3 value of each process, allows the debugger to attribute linear addresses to their correct application source.
  - Time-Stamp Counter (TSC) packets: TSC packets aid in tracking wall-clock time, and contain some portion of the software-visible time-stamp counter.
  - Core Bus Ratio (CBR) packets: CBR packets contain the core:bus clock ratio.

- Overflow (OVF) packets: OVF packets are sent when the processor experiences an internal buffer overflow, resulting in packets being dropped. This packet notifies the decoder of the loss and can help the decoder to respond to this situation.
- Packets about control flow information:
  - Taken Not-Taken (TNT) packets: TNT packets track the “direction” of direct conditional branches (taken or not taken).
  - Target IP (TIP) packets: TIP packets record the target IP of indirect branches, exceptions, interrupts, and other branches or events. These packets can contain the IP, although that IP value may be compressed by eliminating upper bytes that match the last IP. There are various types of TIP packets; they are covered in more detail in Section 35.4.2.2.
  - Flow Update Packets (FUP): FUPs provide the source IP addresses for asynchronous events (interrupt and exceptions), as well as other cases where the source address cannot be determined from the binary.
  - **MODE** packets: These packets provide the decoder with important processor execution information so that it can properly interpret the dis-assembled binary and trace log. MODE packets have a variety of formats that indicate details such as the execution mode (16-bit, 32-bit, or 64-bit).
- Packets inserted by software:
  - PTWRITE (PTW) packets: includes the value of the operand passed to the PTWRITE instruction (see “PTWRITE - Write Data to a Processor Trace Packet” in *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B*).
- Packets about processor power management events:
  - MWAIT packets: Indicate successful completion of an MWAIT operation to a C-state deeper than C0.0.
  - Power State Entry (PWRE) packets: Indicate entry to a C-state deeper than C0.0.
  - Power State Exit (PWRX) packets: Indicate exit from a C-state deeper than C0.0, returning to C0.
  - Execution Stopped (EXSTOP) packets: Indicate that software execution has stopped, due to events such as P-state change, C-state change, or thermal throttling.

## 35.2 INTEL® PROCESSOR TRACE OPERATIONAL MODEL

This section describes the overall Intel Processor Trace mechanism and the essential concepts relevant to how it operates.

### 35.2.1 Change of Flow Instruction (COFI) Tracing

A basic program block is a section of code where no jumps or branches occur. The instruction pointers (IPs) in this block of code need not be traced, as the processor will execute them from start to end without redirecting code flow. Instructions such as branches, and events such as exceptions or interrupts, can change the program flow. These instructions and events that change program flow are called Change of Flow Instructions (COFI). There are three categories of COFI:

- Direct transfer COFI.
- Indirect transfer COFI.
- Far transfer COFI.

The following subsections describe the COFI events that result in trace packet generation. Table 35-1 lists branch instruction by COFI types. For detailed description of specific instructions, see *Intel® 64 and IA-32 Architectures Software Developer’s Manual*.

**Table 35-1. COFI Type for Branch Instructions**

| COFI Type          | Instructions   |
|--------------------|--|
| Conditional Branch | JA, JAE, JB, JBE, JC, JCXZ, JECXZ, JRCXZ, JE, JG, JGE, JL, JLE, JNA, JNAE, JNB, JNBE, JNC, JNE, JNG, JNGE, JNL, JNLE, JNO, JNP, JNS, JNZ, JO, JP, JPE, JPO, JS, JZ, LOOP, LOOPE, LOOPNE, LOOPNZ, LOOPZ |

**Table 35-1. COFI Type for Branch Instructions**

| COFI Type                   | Instructions  |
|-----------------------------|---|
| Unconditional Direct Branch | JMP (E9 xx, EB xx), CALL (E8 xx)  |
| Indirect Branch             | JMP (FF /4), CALL (FF /2)   |
| Near Ret                    | RET (C3, C2 xx)   |
| Far Transfers               | INT3, INTn, INTO, IRET, IRETD, IRETQ, JMP (EA xx, FF /5), CALL (9A xx, FF /3), RET (CB, CA xx), SYS-CALL, SYSRET, SYSENTER, SYSEXIT, VMLAUNCH, VMRESUME |

### 35.2.1.1 Direct Transfer COFI

Direct Transfer COFI are relative branches. This means that their target is an IP whose offset from the current IP is embedded in the instruction bytes. It is not necessary to indicate target of these instructions in the trace output since it can be obtained through the source disassembly. Conditional branches need to indicate only whether the branch is taken or not. Unconditional branches do not need any recording in the trace output. There are two sub-categories:

- **Conditional Branch (Jcc, J\*CXZ) and LOOP**

To track this type of instruction, the processor encodes a single bit (taken or not taken — TNT) to indicate the program flow after the instruction.

Jcc, J\*CXZ, and LOOP can be traced with TNT bits. To improve the trace packet output efficiency, the processor will compact several TNT bits into a single packet.

- **Unconditional Direct Jumps**

There is no trace output required for direct unconditional jumps (like JMP near relative or CALL near relative) since they can be directly inferred from the application assembly. Direct unconditional jumps do not generate a TNT bit or a Target IP packet, though TIP.PGD and TIP.PGE packets can be generated by unconditional direct jumps that toggle Intel PT enables (see Section 35.2.5).

### 35.2.1.2 Indirect Transfer COFI

Indirect transfer instructions involve updating the IP from a register or memory location. Since the register or memory contents can vary at any time during execution, there is no way to know the target of the indirect transfer until the register or memory contents are read. As a result, the disassembled code is not sufficient to determine the target of this type of COFI. Therefore, tracing hardware must send out the destination IP in the trace packet for debug software to determine the target address of the COFI. Note that this IP may be a linear or effective address (see Section 35.3.1.1).

An indirect transfer instruction generates a Target IP Packet (TIP) that contains the target address of the branch. There are two sub-categories:

- **Near JMP Indirect and Near Call Indirect**

As previously mentioned, the target of an indirect COFI resides in the contents of either a register or memory location. Therefore, the processor must generate a packet that includes this target address to allow the decoder to determine the program flow.

- **Near RET**

When a CALL instruction executes, it pushes onto the stack the address of the next instruction following the CALL. Upon completion of the call procedure, the RET instruction is often used to pop the return address off of the call stack and redirect code flow back to the instruction following the CALL.

A RET instruction simply transfers program flow to the address it popped off the stack. Because a called procedure may change the return address on the stack before executing the RET instruction, debug software can be misled if it assumes that code flow will return to the instruction following the last CALL. Therefore, even for near RET, a Target IP Packet may be sent.

- **RET Compression**

A special case is applied if the target of the RET is consistent with what would be expected from tracking the CALL stack. If it is assured that the decoder has seen the corresponding CALL (with “corresponding” defined

as the CALL with matching stack depth), and the RET target is the instruction after that CALL, the RET target may be “compressed”. In this case, only a single TNT bit of “taken” is generated instead of a Target IP Packet. To ensure that the decoder will not be confused in cases of RET compression, only RETs that correspond to CALLs which have been seen since the last PSB packet may be compressed in a given logical processor. For details, see “Indirect Transfer Compression for Returns (RET)” in Section 35.4.2.2.

### 35.2.1.3 Far Transfer COFI

All operations that change the instruction pointer and are not near jumps are “far transfers”. This includes exceptions, interrupts, traps, TSX aborts, and instructions that do far transfers.

All far transfers will produce a Target IP (TIP) packet, which provides the destination IP address. For those far transfers that cannot be inferred from the binary source (e.g., asynchronous events such as exceptions and interrupts), the TIP will be preceded by a Flow Update packet (FUP), which provides the source IP address at which the event was taken. Table 35-23 indicates exactly which IP will be included in the FUP generated by a far transfer.

## 35.2.2 Software Trace Instrumentation with PTWRITE

PTWRITE provides a mechanism by which software can instrument the Intel PT trace. PTWRITE is a ring3-accessible instruction that can be passed to a register or memory variable, see “PTWRITE - Write Data to a Processor Trace Packet” in *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 2B* for details. The contents of that variable will be used as the payload for the PTW packet (see Table 35-40 “PTW Packet Definition”), inserted at the time of PTWRITE retirement, assuming PTWRITE is enabled and all other filtering conditions are met. Decode and analysis software will then be able to determine the meaning of the PTWRITE packet based on the IP of the associated PTWRITE instruction.

PTWRITE is enabled via IA32\_RTIT\_CTL.PTWEn[12] (see Table 35-6). Optionally, the user can use IA32\_RTIT\_CTL.FUPonPTW[5] to enable PTW packets to be followed by FUP packets containing the IP of the associated PTWRITE instruction.

## 35.2.3 Power Event Tracing

Power Event Trace is a capability that exposes core- and thread-level sleep state and power down transition information. When this capability is enabled, the trace will expose information about:

- Scenarios where software execution stops.
  - Due to sleep state entry, frequency change, or other powerdown.
  - Includes the IP, when in the tracing context.
- The requested and resolved hardware thread C-state.
  - Including indication of hardware autonomous C-state entry.
- The last and deepest core C-state achieved during a sleep session.
- The reason for C-state wake.

This information is in addition to the bus ratio (CBR) information provided by default after any powerdown, and the timing information (TSC, TMA, MTC, CYC) provided during or after a powerdown state.

Power Event Trace is enabled via IA32\_RTIT\_CTL.PwrEvtEn[4].

## 35.2.4 Trace Filtering

Intel Processor Trace provides filtering capabilities, by which the debug/profile tool can control what code is traced.

### 35.2.4.1 Filtering by Current Privilege Level (CPL)

Intel PT provides the ability to configure a logical processor to generate trace packets only when CPL = 0, when CPL > 0, or regardless of CPL.

CPL filtering ensures that no IPs or other architectural state information associated with the filtered CPL can be seen in the log. For example, if the processor is configured to trace only when  $CPL > 0$ , and software executes SYSCALL (changing the CPL to 0), the destination IP of the SYSCALL will be suppressed from the generated packet (see the discussion of TIP.PGD in Section 35.4.2.5).

It should be noted that CPL is always 0 in real-address mode and that CPL is always 3 in virtual-8086 mode. To trace code in these modes, filtering should be configured accordingly.

When software is executing in a non-enabled CPL, ContextEn is cleared. See Section 35.2.5.1 for details.

### 35.2.4.2 Filtering by CR3

Intel PT supports a CR3-filtering mechanism by which the generation of packets containing architectural states can be enabled or disabled based on the value of CR3. A debugger can use CR3 filtering to trace only a single application without context switching the state of the RTIT MSRs. For the reconstruction of traces from software with multiple threads, debug software may wish to context-switch for the state of the RTIT MSRs (if the operating system does not provide context-switch support) to separate the output for the different threads (see Section 35.3.5, “Context Switch Consideration”).

To trace for only a single CR3 value, software can write that value to the IA32\_RTIT\_CR3\_MATCH MSR, and set IA32\_RTIT\_CTL.CR3Filter. When CR3 value does not match IA32\_RTIT\_CR3\_MATCH and IA32\_RTIT\_CTL.CR3Filter is 1, ContextEn is forced to 0, and packets containing architectural states will not be generated. Some other packets can be generated when ContextEn is 0; see Section 35.2.5.3 for details. When CR3 does match IA32\_RTIT\_CR3\_MATCH (or when IA32\_RTIT\_CTL.CR3Filter is 0), CR3 filtering does not force ContextEn to 0 (although it could be 0 due to other filters or modes).

CR3 matches IA32\_RTIT\_CR3\_MATCH if the two registers are identical for bits 63:12, or 63:5 when in PAE paging mode; the lower 5 bits of CR3 and IA32\_RTIT\_CR3\_MATCH are ignored. CR3 filtering is independent of the value of CR0.PG.

When CR3 filtering is in use, PIP packets may still be seen in the log if the processor is configured to trace when  $CPL = 0$  (IA32\_RTIT\_CTL.OS = 1). If not, no PIP packets will be seen.

### 35.2.4.3 Filtering by IP

Trace packet generation with configurable filtering by IP is supported if  $CPUID.(EAX=14H, ECX=0):EBX[\text{bit } 2] = 1$ . Intel PT can be configured to enable the generation of packets containing architectural states only when the processor is executing code within certain IP ranges. If the IP is outside of these ranges, generation of some packets is blocked.

IP filtering is enabled using the ADDRn\_CFG fields in the IA32\_RTIT\_CTL MSR (Section 35.2.7.2), where the digit 'n' is a zero-based number that selects which address range is being configured. Each ADDRn\_CFG field configures the use of the register pair IA32\_RTIT\_ADDRn\_A and IA32\_RTIT\_ADDRn\_B (Section 35.2.7.5).

IA32\_RTIT\_ADDRn\_A defines the base and IA32\_RTIT\_ADDRn\_B specifies the limit of the range in which tracing is enabled. Thus each range, referred to as the ADDRn range, is defined by [IA32\_RTIT\_ADDRn\_A.

IA32\_RTIT\_ADDRn\_B]. There can be multiple such ranges, software can query CPUID (Section 35.3.1) for the number of ranges supported on a processor.

Default behavior (ADDRn\_CFG=0) defines no IP filter range, meaning FilterEn is always set. In this case code at any IP can be traced, though other filters, such as CR3 or CPL, could limit tracing. When ADDRn\_CFG is set to enable IP filtering (see Section 35.3.1), tracing will commence when a taken branch or event is seen whose target address is in the ADDRn range.

While inside a tracing region and with FilterEn is set, leaving the tracing region may only be detected once a taken branch or event with a target outside the range is retired. If an ADDRn range is entered or exited by executing the next sequential instruction, rather than by a control flow transfer, FilterEn may not toggle immediately. See Section 35.2.5.5 for more details on FilterEn.

Note that these address range base and limit values are inclusive, such that the range includes the first and last instruction whose first instruction byte is in the ADDRn range.

Depending upon processor implementation, IP filtering may be based on linear or effective address. This can cause different behavior between implementations if CSbase is not equal to zero or in real mode. See Section 35.3.1.1 for details. Software can query CPUID to determine filters are based on linear or effective address (Section 35.3.1).

Note that some packets, such as MTC (Section 35.3.7) and other timing packets, do not depend on FilterEn. For details on which packets depend on FilterEn, and hence are impacted by IP filtering, see Section 35.4.1.

TraceStop

The ADDRn ranges can also be configured to cause tracing to be disabled upon entry to the specified region. This is intended for cases where unexpected code is executed, and the user wishes to immediately stop generating packets in order to avoid overwriting previously written packets.

The TraceStop mechanism works much the same way that IP filtering does, and uses the same address comparison logic. The TraceStop region base and limit values are programmed into one or more ADDRn ranges, but IA32\_RTIT\_CTL.ADDRn\_CFG is configured with the TraceStop encoding. Like FilterEn, TraceStop is detected when a taken branch or event lands in a TraceStop region.

Further, TraceStop requires that TriggerEn=1 at the beginning of the branch/event, and ContextEn=1 upon completion of the branch/event. When this happens, the CPU will set IA32\_RTIT\_STATUS.Stopped, thereby clearing TriggerEn and hence disabling packet generation. This may generate a TIP.PGD packet with the target IP of the branch or event that entered the TraceStop region. Finally, a TraceStop packet will be inserted, to indicate that the condition was hit.

If a TraceStop condition is encountered during buffer overflow (Section 35.3.8), it will not be dropped, but will instead be signaled once the overflow has resolved.

Note that a TraceStop event does not guarantee that all internally buffered packets are flushed out of internal buffers. To ensure that this has occurred, the user should clear TraceEn.

To resume tracing after a TraceStop event, the user must first disable Intel PT by clearing IA32\_RTIT\_CTL.TraceEn before the IA32\_RTIT\_STATUS.Stopped bit can be cleared. At this point Intel PT can be reconfigured, and tracing resumed.

Note that the IA32\_RTIT\_STATUS.Stopped bit can also be set using the ToPA STOP bit. See Section 35.2.6.2.

IP Filtering Example

The following table gives an example of IP filtering behavior. Assume that IA32\_RTIT\_ADDRn\_A = the IP of RangeBase, and that IA32\_RTIT\_ADDRn\_B = the IP of RangeLimit, while IA32\_RTIT\_CTL.ADDRn\_CFG = 0x1 (enable ADDRn range as a FilterEn range).

Table 35-2. IP Filtering Packet Example

| Code Flow  | Packets   |
|--|---|
| Bar:<br>jmp RangeBase // jump into filter range<br>RangeBase:<br>jcc Foo // not taken<br>add eax, 1<br>Foo:<br>jmp RangeLimit+1 // jump out of filter range<br>RangeLimit:<br>nop<br>jcc Bar | TIP.PGE(RangeBase)<br>TNT(0)<br>TIP.PGD(RangeLimit+1) |

IP Filtering and TraceStop

It is possible for the user to configure IP filter range(s) and TraceStop range(s) that overlap. In this case, code executing in the non-overlapping portion of either range will behave as would be expected from that range. Code executing in the overlapping range will get TraceStop behavior.

35.2.5 Packet Generation Enable Controls

Intel Processor Trace includes a variety of controls that determine whether a packet is generated. In general, most packets are sent only if Packet Enable (PacketEn) is set. PacketEn is an internal state maintained in hardware in

response to software configurable enable controls, PacketEn is not visible to software directly. The relationship of PacketEn to the software-visible controls in the configuration MSRs is described in this section.

### 35.2.5.1 Packet Enable (PacketEn)

When PacketEn is set, the processor is in the mode that Intel PT is monitoring and all packets can be generated to log what is being executed. PacketEn is composed of other states according to this relationship:

$$\text{PacketEn} \leftarrow \text{TriggerEn} \text{ AND } \text{ContextEn} \text{ AND } \text{FilterEn} \text{ AND } \text{BranchEn}$$

These constituent controls are detailed in the following subsections.

PacketEn ultimately determines when the processor is tracing. When PacketEn is set, all control flow packets are enabled. When PacketEn is clear, no control flow packets are generated, though other packets (timing and book-keeping packets) may still be sent. See Section 35.2.6 for details of PacketEn and packet generation.

Note that, on processors that do not support IP filtering (i.e., CPUID.(EAX=14H, ECX=0):EBX.IPFILT\_WRSTPRSV[bit 2] = 0), FilterEn is treated as always set.

### 35.2.5.2 Trigger Enable (TriggerEn)

Trigger Enable (TriggerEn) is the primary indicator that trace packet generation is active. TriggerEn is set when IA32\_RTIT\_CTL.TraceEn is set, and cleared by any of the following conditions:

- TraceEn is cleared by software.
- A TraceStop condition is encountered and IA32\_RTIT\_STATUS.Stopped is set.
- IA32\_RTIT\_STATUS.Error is set due to an operational error (see Section 35.3.9).

Software can discover the current TriggerEn value by reading the IA32\_RTIT\_STATUS.TriggerEn bit. When TriggerEn is clear, tracing is inactive and no packets are generated.

### 35.2.5.3 Context Enable (ContextEn)

Context Enable (ContextEn) indicates whether the processor is in the state or mode that software configured hardware to trace. For example, if execution with CPL = 0 code is not being traced (IA32\_RTIT\_CTL.OS = 0), then ContextEn will be 0 when the processor is in CPL0.

Software can discover the current ContextEn value by reading the IA32\_RTIT\_STATUS.ContextEn bit. ContextEn is defined as follows:

$$\begin{aligned} \text{ContextEn} = & !((\text{IA32\_RTIT\_CTL.OS} = 0 \text{ AND } \text{CPL} = 0) \text{ OR} \\ & (\text{IA32\_RTIT\_CTL.USER} = 0 \text{ AND } \text{CPL} > 0) \text{ OR } (\text{IS\_IN\_A\_PRODUCTION\_ENCLAVE}^1) \text{ OR} \\ & (\text{IA32\_RTIT\_CTL.CR3Filter} = 1 \text{ AND } \text{IA32\_RTIT\_CR3\_MATCH} \text{ does not match CR3})) \end{aligned}$$

If the clearing of ContextEn causes PacketEn to be cleared, a Packet Generation Disable (TIP.PGD) packet is generated, but its IP payload is suppressed. If the setting of ContextEn causes PacketEn to be set, a Packet Generation Enable (TIP.PGE) packet is generated.

When ContextEn is 0, control flow packets (TNT, FUP, TIP.\*, MODE.\*) are not generated, and no Linear Instruction Pointers (LIPs) are exposed. However, some packets, such as MTC and PSB (see Section 35.4.2.16 and Section 35.4.2.17), may still be generated while ContextEn is 0. For details of which packets are generated only when ContextEn is set, see Section 35.4.1.

The processor does not update ContextEn when TriggerEn = 0.

The value of ContextEn will toggle only when TriggerEn = 1.

### 35.2.5.4 Branch Enable (BranchEn)

This value is based purely on the IA32\_RTIT\_CTL.BranchEn value. If BranchEn is not set, then relevant COFI packets (TNT, TIP\*, FUP, MODE.\*) are suppressed. Other packets related to timing (TSC, TMA, MTC, CYC), as well

1. Trace packets generation is disabled in a production enclave, see Section 35.2.8.5. See *Intel® Software Guard Extensions Programming Reference* about differences between a production enclave and a debug enclave.

as PSB, will be generated normally regardless. Further, PIP and VMCS continue to be generated, as indicators of what software is running.

### 35.2.5.5 Filter Enable (FilterEn)

Filter Enable indicates that the Instruction Pointer (IP) is within the range of IPs that Intel PT is configured to watch. Software can get the state of Filter Enable by a RDMSR of IA32\_RTIT\_STATUS.FilterEn. For details on configuration and use of IP filtering, see Section 35.2.4.3.

On clearing of FilterEn that also clears PacketEn, a Packet Generation Disable (TIP.PGD) will be generated, but unlike the ContextEn case, the IP payload may not be suppressed. For direct, unconditional branches, as well as for indirect branches (including RETs), the PGD generated by leaving the tracing region and clearing FilterEn will contain the target IP. This means that IPs from outside the configured range can be exposed in the trace, as long as they are within context.

When FilterEn is 0, control flow packets are not generated (e.g., TNT, TIP). However, some packets, such as PIP, MTC, and PSB, may still be generated while FilterEn is clear. For details on packet enable dependencies, see Section 35.4.1.

After TraceEn is set, FilterEn is set to 1 at all times if there is no IP filter range configured by software (IA32\_RTIT\_CTL.ADDRn\_CFG != 1, for all n), or if the processor does not support IP filtering (i.e., CPUID.(EAX=14H, ECX=0):EBX.IPFILT\_WRSTPRSV[bit 2] = 0). FilterEn will toggle only when TraceEn=1 and ContextEn=1, and when at least one range is configured for IP filtering.

## 35.2.6 Trace Output

Intel PT output should be viewed independently from trace content and filtering mechanisms. The options available for trace output can vary across processor generations and platforms.

Trace output is written out using one of the following output schemes, as configured by the ToPA and FabricEn bit fields of IA32\_RTIT\_CTL (see Section 35.2.7.2):

- A single, contiguous region of physical address space.
- A collection of variable-sized regions of physical memory. These regions are linked together by tables of pointers to those regions, referred to as Table of Physical Addresses (ToPA). The trace output stores bypass the caches and the TLBs, but are not serializing. This is intended to minimize the performance impact of the output.
- A platform-specific trace transport subsystem.

Regardless of the output scheme chosen, Intel PT stores bypass the processor caches by default. This ensures that they don't consume precious cache space, but they do not have the serializing aspects associated with un-cacheable (UC) stores. Software should avoid using MTRRs to mark any portion of the Intel PT output region as UC, as this may override the behavior described above and force Intel PT stores to UC, thereby incurring severe performance impact.

There is no guarantee that a packet will be written to memory or other trace endpoint after some fixed number of cycles after a packet-producing instruction executes. The only way to assure that all packets generated have reached their endpoint is to clear TraceEn and follow that with a store, fence, or serializing instruction; doing so ensures that all buffered packets are flushed out of the processor.

### 35.2.6.1 Single Range Output

When IA32\_RTIT\_CTL.ToPA and IA32\_RTIT\_CTL.FabricEn bits are clear, trace packet output is sent to a single, contiguous memory (or MMIO if DRAM is not available) range defined by a base address in IA32\_RTIT\_OUTPUT\_BASE (Section 35.2.7.7) and mask value in IA32\_RTIT\_OUTPUT\_MASK\_PTRS (Section 35.2.7.8). The current write pointer in this range is also stored in IA32\_RTIT\_OUTPUT\_MASK\_PTRS. This output range is circular, meaning that when the writes wrap around the end of the buffer they begin again at the base address.

This output method is best suited for cases where Intel PT output is either:

- Configured to be directed to a sufficiently large contiguous region of DRAM.

- Configured to go to an MMIO debug port, in order to route Intel PT output to a platform-specific trace endpoint (e.g., JTAG). In this scenario, a specific range of addresses is written in a circular manner, and SoC will intercept these writes and direct them to the proper device. Repeated writes to the same address do not overwrite each other, but are accumulated by the debugger, and hence no data is lost by the circular nature of the buffer.

The processor will determine the address to which to write the next trace packet output byte as follows:

```
OutputBase[63:0] ← IA32_RTIT_OUTPUT_BASE[63:0]
OutputMask[63:0] ← ZeroExtend64(IA32_RTIT_OUTPUT_MASK_PTRS[31:0])
OutputOffset[63:0] ← ZeroExtend64(IA32_RTIT_OUTPUT_MASK_PTRS[63:32])
trace_store_phys_addr ← (OutputBase & ~OutputMask) + (OutputOffset & OutputMask)
```

### Single-Range Output Errors

If the output base and mask are not properly configured by software, an operational error (see Section 35.3.9) will be signaled, and tracing disabled. Error scenarios with single-range output are:

- Mask value is non-contiguous.  
IA32\_RTIT\_OUTPUT\_MASK\_PTRS.MaskOrTablePointer value has a 0 in a less significant bit position than the most significant bit containing a 1.
- Base address and Mask are mis-aligned, and have overlapping bits set.  
IA32\_RTIT\_OUTPUT\_BASE && IA32\_RTIT\_OUTPUT\_MASK\_PTRS.MaskOrTableOffset > 0.
- Illegal Output Offset  
IA32\_RTIT\_OUTPUT\_MASK\_PTRS.OutputOffset is greater than the mask value (IA32\_RTIT\_OUTPUT\_MASK\_PTRS.MaskOrTableOffset).

Also note that errors can be signaled due to trace packet output overlapping with restricted memory, see Section 35.2.6.4.

### 35.2.6.2 Table of Physical Addresses (ToPA)

When IA32\_RTIT\_CTL.ToPA is set and IA32\_RTIT\_CTL.FabricEn is clear, the ToPA output mechanism is utilized. The ToPA mechanism uses a linked list of tables; see Figure 35-1 for an illustrative example. Each entry in the table contains some attribute bits, a pointer to an output region, and the size of the region. The last entry in the table may hold a pointer to the next table. This pointer can either point to the top of the current table (for circular array) or to the base of another table. The table size is not fixed, since the link to the next table can exist at any entry.

The processor treats the various output regions referenced by the ToPA table(s) as a unified buffer. This means that a single packet may span the boundary between one output region and the next.

The ToPA mechanism is controlled by three values maintained by the processor:

- proc\_trace\_table\_base.**  
This is the physical address of the base of the current ToPA table. When tracing is enabled, the processor loads this value from the IA32\_RTIT\_OUTPUT\_BASE MSR. While tracing is enabled, the processor updates the IA32\_RTIT\_OUTPUT\_BASE MSR with changes to proc\_trace\_table\_base, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc\_trace\_table\_base.
- proc\_trace\_table\_offset.**  
This indicates the entry of the current table that is currently in use. (This entry contains the address of the current output region.) When tracing is enabled, the processor loads this value from bits 31:7 (MaskOrTableOffset) of the IA32\_RTIT\_OUTPUT\_MASK\_PTRS. While tracing is enabled, the processor updates IA32\_RTIT\_OUTPUT\_MASK\_PTRS.MaskOrTableOffset with changes to proc\_trace\_table\_offset, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of proc\_trace\_table\_offset.
- proc\_trace\_output\_offset.**  
This is a pointer into the current output region and indicates the location of the next write. When tracing is enabled, the processor loads this value from bits 63:32 (OutputOffset) of the IA32\_RTIT\_OUTPUT\_MASK\_PTRS. While tracing is enabled, the processor updates

IA32\_RTIT\_OUTPUT\_MASK\_PTRS.OutputOffset with changes to `proc_trace_output_offset`, but these updates may not be synchronous to software execution. When tracing is disabled, the processor ensures that the MSR contains the latest value of `proc_trace_output_offset`.

Figure 35-1 provides an illustration (not to scale) of the table and associated pointers.

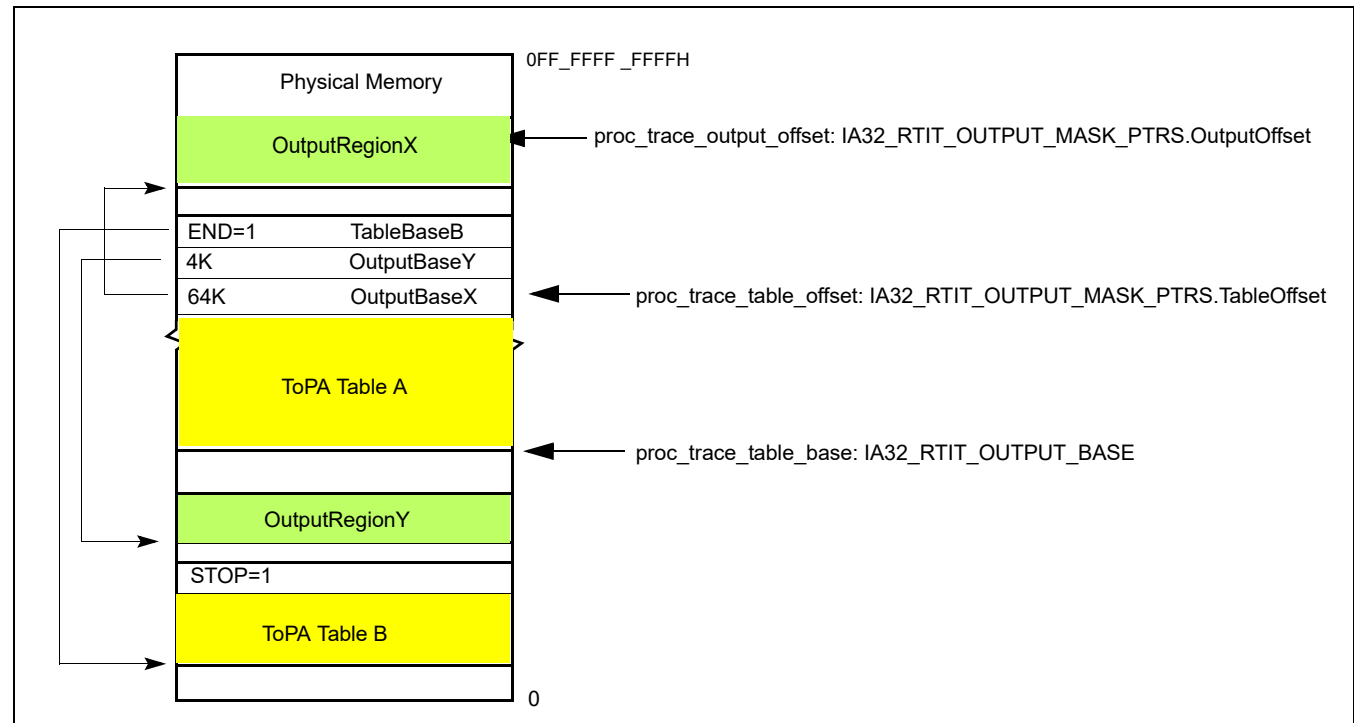

Figure 35-1. ToPA Memory Illustration

With the ToPA mechanism, the processor writes packets to the current output region (identified by `proc_trace_table_base` and the `proc_trace_table_offset`). The offset within that region to which the next byte will be written is identified by `proc_trace_output_offset`. When that region is filled with packet output (thus `proc_trace_output_offset = RegionSize-1`), `proc_trace_table_offset` is moved to the next ToPA entry, `proc_trace_output_offset` is set to 0, and packet writes begin filling the new output region specified by `proc_trace_table_offset`.

As packets are written out, each store derives its physical address as follows:

$$\text{trace\_store\_phys\_addr} \leftarrow \text{Base address from current ToPA table entry} + \text{proc\_trace\_output\_offset}$$

Eventually, the regions represented by all entries in the table may become full, and the final entry of the table is reached. An entry can be identified as the final entry because it has either the END or STOP attribute. The END attribute indicates that the address in the entry does not point to another output region, but rather to another ToPA table. The STOP attribute indicates that tracing will be disabled once the corresponding region is filled. See Section 35.2.6.2 for details on STOP.

When an END entry is reached, the processor loads `proc_trace_table_base` with the base address held in this END entry, thereby moving the current table pointer to this new table. The `proc_trace_table_offset` is reset to 0, as is the `proc_trace_output_offset`, and packet writes will resume at the base address indicated in the first entry.

If the table has no STOP or END entry, and trace-packet generation remains enabled, eventually the maximum table size will be reached (`proc_trace_table_offset = 01FFFFFFH`). In this case, the `proc_trace_table_offset` and `proc_trace_output_offset` are reset to 0 (wrapping back to the beginning of the current table) once the last output region is filled.

It is important to note that processor updates to the IA32\_RTIT\_OUTPUT\_BASE and IA32\_RTIT\_OUTPUT\_MASK\_PTRS MSRs are asynchronous to instruction execution. Thus, reads of these MSRs

while Intel PT is enabled may return stale values. Like all IA32\_RTIT\_\* MSRs, the values of these MSRs should not be trusted or saved unless trace packet generation is first disabled by clearing IA32\_RTIT\_CTL.TraceEn. This ensures that the output MSR values account for all packets generated to that point, after which the output MSR values will be frozen until tracing resumes.<sup>1</sup>

The processor may cache internally any number of entries from the current table or from tables that it references (directly or indirectly). If tracing is enabled, the processor may ignore or delay detection of modifications to these tables. To ensure that table changes are detected by the processor in a predictable manner, software should clear TraceEn before modifying the current table (or tables that it references) and only then re-enable packet generation.

### Single Output Region ToPA Implementation

The first processor generation to implement Intel PT supports only ToPA configurations with a single ToPA entry followed by an END entry that points back to the first entry (creating one circular output buffer). Such processors enumerate CPUID.(EAX=14H,ECX=0):ECX.MENTRY[bit 1] = 0 and CPUID.(EAX=14H,ECX=0):ECX.TOPAOUT[bit 0] = 1.

If CPUID.(EAX=14H,ECX=0):ECX.MENTRY[bit 1] = 0, ToPA tables can hold only one output entry, which must be followed by an END=1 entry which points back to the base of the table. Hence only one contiguous block can be used as output.

The lone output entry can have INT or STOP set, but nonetheless must be followed by an END entry as described above. Note that, if INT=1, the PMI will actually be delivered before the region is filled.

### ToPA Table Entry Format

The format of ToPA table entries is shown in Figure 35-2. The size of the address field is determined by the processor's physical-address width (MAXPHYADDR) in bits, as reported in CPUID.80000008H:EAX[7:0].

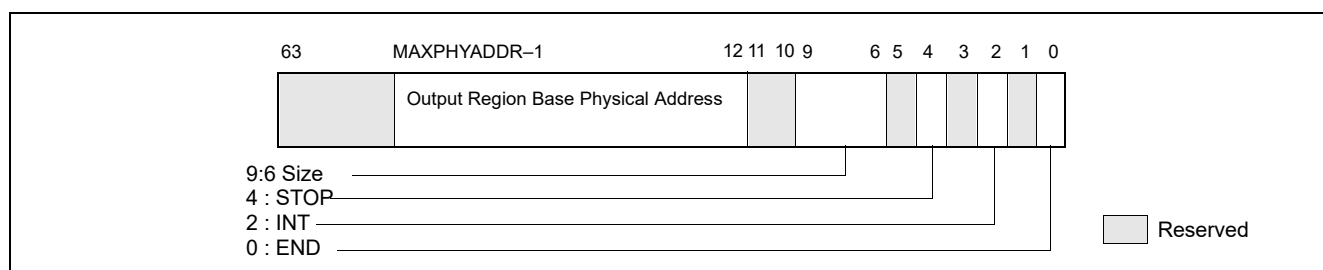

Figure 35-2. Layout of ToPA Table Entry

Table 35-3 describes the details of the ToPA table entry fields. If reserved bits are set to 1, an error is signaled.

Table 35-3. ToPA Table Entry Fields

| ToPA Entry Field                    | Description  |
|-------------------------------------|--|
| Output Region Base Physical Address | If END=0, this is the base physical address of the output region specified by this entry. Note that all regions must be aligned based on their size. Thus a 2M region must have bits 20:12 clear. If the region is not properly aligned, an operational error will be signaled when the entry is reached.<br>If END=1, this is the 4K-aligned base physical address of the next ToPA table (which may be the base of the current table, or the first table in the linked list if a circular buffer is desired). If the processor supports only a single ToPA output region (see above), this address must be the value currently in the IA32_RTIT_OUTPUT_BASE MSR. |
| Size                                | Indicates the size of the associated output region. Encodings are:<br>0: 4K, 1: 8K, 2: 16K, 3: 32K, 4: 64K, 5: 128K, 6: 256K, 7: 512K,<br>8: 1M, 9: 2M, 10: 4M, 11: 8M, 12: 16M, 13: 32M, 14: 64M, 15: 128M<br>This field is ignored if END=1.   |

1. Although WRMSR is a serializing instruction, the execution of WRMSR that forces packet writes by clearing TraceEn does not itself cause these writes to be globally observed.

**Table 35-3. ToPA Table Entry Fields (Contd.)**

| ToPA Entry Field | Description   |
|------------------|---|
| STOP             | When the output region indicated by this entry is filled, software should disable packet generation. This will be accomplished by setting IA32_RTIT_STATUS.Stopped, which clears TriggerEn. This bit must be 0 if END=1; otherwise it is treated as reserved bit violation (see ToPA Errors).   |
| INT              | When the output region indicated by this entry is filled, signal Perfmon LVT interrupt.<br>Note that if both INT and STOP are set in the same entry, the STOP will happen before the INT. Thus the interrupt handler should expect that the IA32_RTIT_STATUS.Stopped bit will be set, and will need to be reset before tracing can be resumed.<br>This bit must be 0 if END=1; otherwise it is treated as reserved bit violation (see ToPA Errors). |
| END              | If set, indicates that this is an END entry, and thus the address field points to a table base rather than an output region base.<br>If END=1, INT and STOP must be set to 0; otherwise it is treated as reserved bit violation (see ToPA Errors). The Size field is ignored in this case.<br>If the processor supports only a single ToPA output region (see above), END must be set in the second table entry.                                    |

### ToPA STOP

Each ToPA entry has a STOP bit. If this bit is set, the processor will set the IA32\_RTIT\_STATUS.Stopped bit when the corresponding trace output region is filled. This will clear TriggerEn and thereby cease packet generation. See Section 35.2.7.4 for details on IA32\_RTIT\_STATUS.Stopped. This sequence is known as “ToPA Stop”.

No TIP.PGD packet will be seen in the output when the ToPA stop occurs, since the disable happens only when the region is already full. When this occurs, output ceases after the last byte of the region is filled, which may mean that a packet is cut off in the middle. Any packets remaining in internal buffers are lost and cannot be recovered.

When ToPA stop occurs, the IA32\_RTIT\_OUTPUT\_BASE MSR will hold the base address of the table whose entry had STOP=1. IA32\_RTIT\_OUTPUT\_MASK\_PTRS.MaskOrTableOffset will hold the index value for that entry, and the IA32\_RTIT\_OUTPUT\_MASK\_PTRS.OutputOffset should be set to the size of the region.

Note that this means the offset pointer is pointing to the next byte after the end of the region, a configuration that would produce an operational error if the configuration remained when tracing is re-enabled with IA32\_RTIT\_STATUS.Stopped cleared.

### ToPA PMI

Each ToPA entry has an INT bit. If this bit is set, the processor will signal a performance-monitoring interrupt (PMI) when the corresponding trace output region is filled. This interrupt is not precise, and it is thus likely that writes to the next region will occur by the time the interrupt is taken.

The following steps should be taken to configure this interrupt:

1. Enable PMI via the LVT Performance Monitor register (at MMIO offset 340H in xAPIC mode; via MSR 834H in x2APIC mode). See *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3B* for more details on this register. For ToPA PMI, set all fields to 0, save for the interrupt vector, which can be selected by software.
2. Set up an interrupt handler to service the interrupt vector that a ToPA PMI can raise.
3. Set the interrupt flag by executing STI.
4. Set the INT bit in the ToPA entry of interest and enable packet generation, using the ToPA output option. Thus, TraceEn=ToPA=1 in the IA32\_RTIT\_CTL MSR.

Once the INT region has been filled with packet output data, the interrupt will be signaled. This PMI can be distinguished from others by checking bit 55 (Trace\_ToPA\_PMI) of the IA32\_PERF\_GLOBAL\_STATUS MSR (MSR 38EH). Once the ToPA PMI handler has serviced the relevant buffer, writing 1 to bit 55 of the MSR at 390H (IA32\_GLOBAL\_STATUS\_RESET) clears IA32\_PERF\_GLOBAL\_STATUS.Trace\_ToPA\_PMI.

Intel PT is not frozen on PMI, and thus the interrupt handler will be traced (though filtering can prevent this). The Freeze\_Perfmon\_on\_PMI and Freeze\_LBRs\_on\_PMI settings in IA32\_DEBUGCTL will be applied on ToPA PMI just as on other PMIs, and hence Perfmon counters are frozen.

Assuming the PMI handler wishes to read any buffered packets for persistent output, or wishes to modify any Intel PT MSRs, software should first disable packet generation by clearing TraceEn. This ensures that all buffered packets are written to memory and avoids tracing of the PMI handler. The configuration MSRs can then be used to determine where tracing has stopped. If packet generation is disabled by the handler, it should then be manually re-enabled before the IRET if continued tracing is desired.

In rare cases, it may be possible to trigger a second ToPA PMI before the first is handled. This can happen if another ToPA region with INT=1 is filled before, or shortly after, the first PMI is taken, perhaps due to EFLAGS.IF being cleared for an extended period of time. This can manifest in two ways: either the second PMI is triggered before the first is taken, and hence only one PMI is taken, or the second is triggered after the first is taken, and thus will be taken when the handler for the first completes. Software can minimize the likelihood of the second case by clearing TraceEn at the beginning of the PMI handler. Further, it can detect such cases by then checking the Interrupt Request Register (IRR) for PMI pending, and checking the ToPA table base and off-set pointers (in IA32\_RTIT\_OUTPUT\_BASE and IA32\_RTIT\_OUTPUT\_MASK\_PTRS) to see if multiple entries with INT=1 have been filled.

### ToPA PMI and Single Output Region ToPA Implementation

A processor that supports only a single ToPA output region implementation (such that only one output region is supported; see above) will attempt to signal a ToPA PMI interrupt before the output wraps and overwrites the top of the buffer. To support this functionality, the PMI handler should disable packet generation as soon as possible.

Due to PMI skid, it is possible that, in rare cases, the wrap will have occurred before the PMI is delivered. Software can avoid this by setting the STOP bit in the ToPA entry (see Table 35-3); this will disable tracing once the region is filled, and no wrap will occur. This approach has the downside of disabling packet generation so that some of the instructions that led up to the PMI will not be traced. If the PMI skid is significant enough to cause the region to fill and tracing to be disabled, the PMI handler will need to clear the IA32\_RTIT\_STATUS.Stopped indication before tracing can resume.

### ToPA PMI and XSAVES/XRSTORS State Handling

In some cases the ToPA PMI may be taken after completion of an XSAVES instruction that switches Intel PT state, and in such cases any modification of Intel PT MSRs within the PMI handler will not persist when the saved Intel PT context is later restored with XRSTORS. To account for such a scenario, it is recommended that the Intel PT output configuration be modified by altering the ToPA tables themselves, rather than the Intel PT output MSRs.

Table 35-4 depicts a recommended PMI handler algorithm for managing multi-region ToPA output and handling ToPA PMIs that may arrive between XSAVES and XRSTORS. This algorithm is flexible to allow software to choose between adding entries to the current ToPA table, adding a new ToPA table, or using the current ToPA table as a circular buffer. It assumes that the ToPA entry that triggers the PMI is not the last entry in the table, which is the recommended treatment.

**Table 35-4. Algorithm to Manage Intel PT ToPA PMI and XSAVES/XRSTORS**

| Pseudo Code Flow   |
|--|
| <pre> IF (IA32_PERF_GLOBAL_STATUS.ToPA)   Save IA32_RTIT_CTL value;   IF ( IA32_RTIT_CTL.TraceEN )     Disable Intel PT by clearing TraceEn;   FI;   IF ( there is space available to grow the current ToPA table )     Add one or more ToPA entries after the last entry in the ToPA table;     Point new ToPA entry address field(s) to new output region base(s);   ELSE     Modify an upcoming ToPA entry in the current table to have END=1;     IF (output should transition to a new ToPA table )       Point the address of the "END=1" entry of the current table to the new table base;     ELSE       /* Continue to use the current ToPA table, make a circular. */       Point the address of the "END=1" entry to the base of the current table;       Modify the ToPA entry address fields for filled output regions to point to new, unused output regions;       /* Filled regions are those with index in the range of 0 to (IA32_RTIT_MASK_PTRS.MaskOrTableOffset -1). */     FI;   FI;   Restore saved IA32_RTIT_CTL.value; FI; </pre> |

## ToPA Errors

When a malformed ToPA entry is found, an **operation error** results (see Section 35.3.9). A malformed entry can be any of the following:

- ToPA entry reserved bit violation.**  
This describes cases where a bit marked as reserved in Section 35.2.6.2 above is set to 1.
- ToPA alignment violation.**  
This includes cases where illegal ToPA entry base address bits are set to 1:
  - ToPA table base address is not 4KB-aligned. The table base can be from a WRMSR to IA32\_RTIT\_OUTPUT\_BASE, or from a ToPA entry with END=1.
  - ToPA entry base address is not aligned to the ToPA entry size (e.g., a 2MB region with base address[20:12] not equal to 0).
  - ToPA entry base address sets upper physical address bits not supported by the processor.
- Illegal ToPA Output Offset** (if IA32\_RTIT\_STATUS.Stopped=0).  
IA32\_RTIT\_OUTPUT\_MASK\_PTRS.OutputOffset is greater than or equal to the size of the current ToPA output region size.
- ToPA rules violations.**  
These are similar to ToPA entry reserved bit violations; they are cases when a ToPA entry is encountered with illegal field combinations. They include the following:
  - Setting the STOP or INT bit on an entry with END=1.
  - Setting the END bit in entry 0 of a ToPA table.
  - On processors that support only a single ToPA entry (see above), two additional illegal settings apply:
    - ToPA table entry 1 with END=0.
    - ToPA table entry 1 with base address not matching the table base.

In all cases, the error will be logged by setting `IA32_RTIT_STATUS.Error`, thereby disabling tracing when the problematic ToPA entry is reached (when `proc_trace_table_offset` points to the entry containing the error). Any packet bytes that are internally buffered when the error is detected may be lost.

Note that operational errors may also be signaled due to attempts to access restricted memory. See Section 35.2.6.4 for details.

A tracing software have a range of flexibility using ToPA to manage the interaction of Intel PT with application buffers, see Section 35.5.

### 35.2.6.3 Trace Transport Subsystem

When `IA32_RTIT_CTL.FabricEn` is set, the `IA32_RTIT_CTL.ToPA` bit is ignored, and trace output is written to the trace transport subsystem. The endpoints of this transport are platform-specific, and details of configuration options should refer to the specific platform documentation. The `FabricEn` bit is available to be set if `CPUID(EAX=14H,ECX=0):EBX[bit 3] = 1`.

### 35.2.6.4 Restricted Memory Access

Packet output cannot be directed to any regions of memory that are restricted by the platform. In particular, all memory accesses on behalf of packet output are checked against the SMRR regions. If there is any overlap with these regions, trace data collection will not function properly. Exact processor behavior is implementation-dependent; Table 35-5 summarizes several scenarios.

**Table 35-5. Behavior on Restricted Memory Access**

| Scenario                              | Description   |
|---------------------------------------|---|
| ToPA output region overlaps with SMRR | Stores to the restricted memory region will be dropped, and that packet data will be lost. Any attempt to read from that restricted region will return all 1s. The processor also may signal an error (Section 35.3.9) and disable tracing when the output pointer reaches the restricted region. If packet generation remains enabled, then packet output may continue once stores are no longer directed to restricted memory (on wrap, or if the output region is larger than the restricted memory region). |
| ToPA table overlaps with SMRR         | The processor will signal an error (Section 35.3.9) and disable tracing when the ToPA read pointer ( <code>IA32_RTIT_OUTPUT_BASE + (proc_trace_table_offset &lt;&lt; 3)</code> ) enters the restricted region.  |

It should also be noted that packet output should not be routed to the 4KB APIC MMIO region, as defined by the `IA32_APIC_BASE` MSR. For details about the APIC, refer to *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3A*. No error is signaled for this case.

### Modifications to Restricted Memory Regions

It is recommended that software disable packet generation before modifying the SMRRs to change the scope of the SMRR regions. This is because the processor reserves the right to cache any number of ToPA table entries internally, after checking them against restricted memory ranges. Once cached, the entries will not be checked again, meaning one could potentially route packet output to a newly restricted region. Software can ensure that any cached entries are written to memory by clearing `IA32_RTIT_CTL.TraceEn`.

## 35.2.7 Enabling and Configuration MSRs

### 35.2.7.1 General Considerations

Trace packet generation is enabled and configured by a collection of model-specific registers (MSRs), which are detailed below. Some notes on the configuration MSR behavior:

- If Intel Processor Trace is not supported by the processor (see Section 35.3.1), RDMSR or WRMSR of the `IA32_RTIT_*` MSRs will cause `#GP`.
- A WRMSR to any of these configuration MSRs that begins and ends with `IA32_RTIT_CTL.TraceEn` set will `#GP` fault. Packet generation must be disabled before the configuration MSRs can be changed.

Note: Software may write the same value back to IA32\_RTIT\_CTL without #GP, even if TraceEn=1.

- All configuration MSRs for Intel PT are duplicated per logical processor
- For each configuration MSR, any MSR write that attempts to change bits marked reserved, or utilize encodings marked reserved, will cause a #GP fault.
- All configuration MSRs for Intel PT are cleared on a cold RESET.
  - If CPUID.(EAX=14H, ECX=0):EBX.IPFILT\_WRSTPRSV[bit 2] = 1, only the TraceEn bit is cleared on warm RESET; though this may have the impact of clearing other bits in IA32\_RTIT\_STATUS. Other MSR values of the trace configuration MSRs are preserved on warm RESET.
- The semantics of MSR writes to trace configuration MSRs in this chapter generally apply to explicit WRMSR to these registers, using VM-exit or VM-entry MSR load list to these MSRs, XRSTORS with requested feature bit map including XSAVE map component of state\_8 (corresponding to IA32\_XSS[bit 8]), and the write to IA32\_RTIT\_CTL.TraceEn by XSAVES (Section 35.3.5.2).

### 35.2.7.2 IA32\_RTIT\_CTL MSR

IA32\_RTIT\_CTL, at address 570H, is the primary enable and control MSR for trace packet generation. Bit positions are listed in Table 35-6.

**Table 35-6. IA32\_RTIT\_CTL MSR**

| Position | Bit Name  | At Reset | Bit Description  |
|----------|-----------|----------|--|
| 0        | TraceEn   | 0        | If 1, enables tracing; else tracing is disabled.<br><br>When this bit transitions from 1 to 0, all buffered packets are flushed out of internal buffers. A further store, fence, or architecturally serializing instruction may be required to ensure that packet data can be observed at the trace endpoint. See Section 35.2.7.3 for details of enabling and disabling packet generation.<br><br>Note that the processor will clear this bit on #SMI (Section ) and warm reset. Other MSR bits of IA32_RTIT_CTL (and other trace configuration MSRs) are not impacted by these events. |

| 59:48    | Reserved  | 0        | Reserved only for future trace content enables, or address filtering configuration enables. Must be 0.  |
| 63:60    | Reserved  | 0        | Must be 0.  |

### 35.2.7.3 Enabling and Disabling Packet Generation with TraceEn

When TraceEn transitions from 0 to 1, Intel Processor Trace is enabled, and a series of packets may be generated. These packets help ensure that the decoder is aware of the state of the processor when the trace begins, and that it can keep track of any timing or state changes that may have occurred while packet generation was disabled. A full PSB+ (see Section 35.4.2.17) will be generated if IA32\_RTIT\_STATUS.PacketByteCnt=0, and may be generated in other cases as well. Otherwise, timing packets will be generated, including TSC, TMA, and CBR (see Section 35.4.2).

In addition to the packets discussed above, if and when PacketEn (Section 35.2.5.1) transitions from 0 to 1 (which may happen immediately, depending on filtering settings), a TIP.PGE packet (Section 35.4.2.3) will be generated.

When TraceEn is set, the processor may read ToPA entries from memory and cache them internally. For this reason, software should disable packet generation before making modifications to the ToPA tables (or changing the configuration of restricted memory regions). See Section 35.7 for more details of packets that may be generated with modifications to TraceEn.

### Disabling Packet Generation

Clearing TraceEn causes any packet data buffered within the logical processor to be flushed out, after which the output MSRs (IA32\_RTIT\_OUTPUT\_BASE and IA32\_RTIT\_OUTPUT\_MASK\_PTRS) will have stable values. When output is directed to memory, a store, fence, or architecturally serializing instruction may be required to ensure that the packet data is globally observed. No special packets are generated by disabling packet generation, though a TIP.PGD may result if PacketEn=1 at the time of disable.

### Other Writes to IA32\_RTIT\_CTL

Any attempt to modify IA32\_RTIT\_CTL while TraceEn is set will result in a general-protection fault (#GP) unless the same write also clears TraceEn. However, writes to IA32\_RTIT\_CTL that do not modify any bits will not cause a #GP, even if TraceEn remains set.

### 35.2.7.4 IA32\_RTIT\_STATUS MSR

The IA32\_RTIT\_STATUS MSR is readable and writable by software, but some bits (ContextEn, TriggerEn) are read-only and cannot be directly modified. The WRMSR instruction ignores these bits in the source operand (attempts to modify these bits are ignored and do not cause WRMSR to fault).

This MSR can only be written when IA32\_RTIT\_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). The processor does not modify the value of this MSR while TraceEn is 0 (software can modify it with WRMSR).

Table 35-7. IA32\_RTIT\_STATUS MSR

| Position | Bit Name      | At Reset | Bit Description   |
|----------|---------------|----------|---|
| 0        | FilterEn      | 0        | This bit is written by the processor, and indicates that tracing is allowed for the current IP, see Section 35.2.5.5. Writes are ignored.   |
| 1        | ContextEn     | 0        | The processor sets this bit to indicate that tracing is allowed for the current context. See Section 35.2.5.3. Writes are ignored.  |
| 2        | TriggerEn     | 0        | The processor sets this bit to indicate that tracing is enabled. See Section 35.2.5.2. Writes are ignored.  |
| 3        | Reserved      | 0        | Must be 0.  |
| 4        | Error         | 0        | The processor sets this bit to indicate that an operational error has been encountered. When this bit is set, TriggerEn is cleared to 0 and packet generation is disabled. For details, see “ToPA Errors” in Section 35.2.6.2.<br><br>When TraceEn is cleared, software can write this bit. Once it is set, only software can clear it. It is not recommended that software ever set this bit, except in cases where it is restoring a prior saved state. |
| 5        | Stopped       | 0        | The processor sets this bit to indicate that a ToPA Stop condition has been encountered. When this bit is set, TriggerEn is cleared to 0 and packet generation is disabled. For details, see “ToPA STOP” in Section 35.2.6.2.<br><br>When TraceEn is cleared, software can write this bit. Once it is set, only software can clear it. It is not recommended that software ever set this bit, except in cases where it is restoring a prior saved state.  |
| 31:6     | Reserved      | 0        | Must be 0.  |
| 48:32    | PacketByteCnt | 0        | This field is written by the processor, and holds a count of packet bytes that have been sent out. The processor also uses this field to determine when the next PSB packet should be inserted. Note that the processor may clear or modify this field at any time while IA32_RTIT_CTL.TraceEn=1. It will have a stable value when IA32_RTIT_CTL.TraceEn=0. See Section 35.4.2.17 for details.  |
| 63:49    | Reserved      | 0        | Must be 0.  |

### 35.2.7.5 IA32\_RTIT\_ADDRn\_A and IA32\_RTIT\_ADDRn\_B MSRs

The role of the IA32\_RTIT\_ADDRn\_A/B register pairs, for each n, is determined by the corresponding ADDRn\_CFG fields in IA32\_RTIT\_CTL (see Section 35.2.7.2). The number of these register pairs is enumerated by CPUID.(EAX=14H, ECX=1):EAX.RANGE CNT[2:0].

- Processors that enumerate support for 1 range support:  
IA32\_RTIT\_ADDR0\_A, IA32\_RTIT\_ADDR0\_B
- Processors that enumerate support for 2 ranges support:  
IA32\_RTIT\_ADDR0\_A, IA32\_RTIT\_ADDR0\_B  
IA32\_RTIT\_ADDR1\_A, IA32\_RTIT\_ADDR1\_B
- Processors that enumerate support for 3 ranges support:  
IA32\_RTIT\_ADDR0\_A, IA32\_RTIT\_ADDR0\_B  
IA32\_RTIT\_ADDR1\_A, IA32\_RTIT\_ADDR1\_B  
IA32\_RTIT\_ADDR2\_A, IA32\_RTIT\_ADDR2\_B
- Processors that enumerate support for 4 ranges support:  
IA32\_RTIT\_ADDR0\_A, IA32\_RTIT\_ADDR0\_B  
IA32\_RTIT\_ADDR1\_A, IA32\_RTIT\_ADDR1\_B  
IA32\_RTIT\_ADDR2\_A, IA32\_RTIT\_ADDR2\_B  
IA32\_RTIT\_ADDR3\_A, IA32\_RTIT\_ADDR3\_B

Each register has a single 64-bit field that holds a linear address value. Writes must ensure that the address is in canonical form, otherwise a #GP fault will result.

### 35.2.7.6 IA32\_RTIT\_CR3\_MATCH MSR

The IA32\_RTIT\_CR3\_MATCH register is compared against CR3 when IA32\_RTIT\_CTL.CR3Filter is 1. Bits 63:5 hold the CR3 address value to match, bits 4:0 are reserved to 0. For more details on CR3 filtering and the treatment of this register, see Section 35.2.4.2.

This MSR can be written only when IA32\_RTIT\_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP). IA32\_RTIT\_CR3\_MATCH[4:0] are reserved and must be 0; an attempt to set those bits using WRMSR causes a #GP.

### 35.2.7.7 IA32\_RTIT\_OUTPUT\_BASE MSR

This MSR is used to configure the trace output destination, when output is directed to memory (IA32\_RTIT\_CTL.FabricEn = 0). The size of the address field is determined by the maximum physical address width (MAXPHYADDR), as reported by CPUID.80000008H:EAX[7:0].

When the ToPA output scheme is used, the processor may update this MSR when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32\_RTIT\_CTL.TraceEn = 0).

Accesses to this MSR are supported only if Intel PT output to memory is supported, hence when either CPUID.(EAX=14H, ECX=0):ECX[bit 0] or CPUID.(EAX=14H, ECX=0):ECX[bit 2] are set. Otherwise WRMSR or RDMSR cause a general-protection fault (#GP). If supported, this MSR can be written only when IA32\_RTIT\_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

**Table 35-8. IA32\_RTIT\_OUTPUT\_BASE MSR**

| Position       | Bit Name     | At Reset | Bit Description   |
|----------------|--------------|----------|---|
| 6:0            | Reserved     | 0        | Must be 0.  |
| MAXPHYADDR-1:7 | BasePhysAddr | 0        | <p>The base physical address. How this address is used depends on the value of IA32_RTIT_CTL.ToPA:</p> <p>0: This is the base physical address of a single, contiguous physical output region. This could be mapped to DRAM or to MMIO, depending on the value.</p> <p>The base address should be aligned with the size of the region, such that none of the 1s in the mask value(Section 35.2.7.8) overlap with 1s in the base address. If the base is not aligned, an operational error will result (see Section 35.3.9).</p> <p>1: The base physical address of the current ToPA table. The address must be 4K aligned. Writing an address in which bits 11:7 are non-zero will not cause a #GP, but an operational error will be signaled once TraceEn is set. See “ToPA Errors” in Section 35.2.6.2 as well as Section 35.3.9.</p> |
| 63:MAXPHYADDR  | Reserved     | 0        | Must be 0.  |

### 35.2.7.8 IA32\_RTIT\_OUTPUT\_MASK\_PTRS MSR

This MSR holds any mask or pointer values needed to indicate where the next byte of trace output should be written. The meaning of the values held in this MSR depend on whether the ToPA output mechanism is in use. See Section 35.2.6.2 for details.

The processor updates this MSR while when packet generation is enabled, and those updates are asynchronous to instruction execution. Therefore, the values in this MSR should be considered unreliable unless packet generation is disabled (IA32\_RTIT\_CTL.TraceEn = 0).

Accesses to this MSR are supported only if Intel PT output to memory is supported, hence when either CPUID.(EAX=14H, ECX=0):ECX[bit 0] or CPUID.(EAX=14H, ECX=0):ECX[bit 2] are set. Otherwise WRMSR or RDMSR cause a general-protection fault (#GP). If supported, this MSR can be written only when IA32\_RTIT\_CTL.TraceEn is 0; otherwise WRMSR causes a general-protection fault (#GP).

**Table 35-9. IA32\_RTIT\_OUTPUT\_MASK\_PTRS MSR**

| Position | Bit Name          | At Reset | Bit Description   |
|----------|-------------------|----------|---|
| 6:0      | LowerMask         | 7FH      | Forced to 1, writes are ignored.  |
| 31:7     | MaskOrTableOffset | 0        | <p>The use of this field depends on the value of IA32_RTIT_CTL.ToPA:</p> <p>0: This field holds bits 31:7 of the mask value for the single, contiguous physical output region. The size of this field indicates that regions can be of size 128B up to 4GB. This value (combined with the lower 7 bits, which are reserved to 1) will be ANDed with the OutputOffset field to determine the next write address. All 1s in this field should be consecutive and starting at bit 7, otherwise the region will not be contiguous, and an operational error (Section 35.3.9) will be signaled when TraceEn is set.</p> <p>1: This field holds bits 27:3 of the offset pointer into the current ToPA table. This value can be added to the IA32_RTIT_OUTPUT_BASE value to produce a pointer to the current ToPA table entry, which itself is a pointer to the current output region. In this scenario, the lower 7 reserved bits are ignored. This field supports tables up to 256 MBytes in size.</p> |

**Table 35-9. IA32\_RTIT\_OUTPUT\_MASK\_PTRS MSR (Contd.)**

| Position | Bit Name     | At Reset | Bit Description  |
|----------|--------------|----------|--|
| 63:32    | OutputOffset | 0        | <p>The use of this field depends on the value of IA32_RTIT_CTL.ToPA:</p> <p>0: This is bits 31:0 of the offset pointer into the single, contiguous physical output region. This value will be added to the IA32_RTIT_OUTPUT_BASE value to form the physical address at which the next byte of packet output data will be written. This value must be less than or equal to the MaskOrTableOffset field, otherwise an operational error (Section 35.3.9) will be signaled when TraceEn is set.</p> <p>1: This field holds bits 31:0 of the offset pointer into the current ToPA output region. This value will be added to the output region base field, found in the current ToPA table entry, to form the physical address at which the next byte of trace output data will be written. This value must be less than the ToPA entry size, otherwise an operational error (Section 35.3.9) will be signaled when TraceEn is set.</p> |

## 35.2.8 Interaction of Intel® Processor Trace and Other Processor Features

### 35.2.8.1 Intel® Transactional Synchronization Extensions (Intel® TSX)

The operation of Intel TSX is described in Chapter 14 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 1*. For tracing purpose, packet generation does not distinguish between hardware lock elision (HLE) and restricted transactional memory (RTM), but speculative execution does have impacts on the trace output. Specifically, packets are generated as instructions complete, even for instructions in a transactional region that is later aborted. For this reason, debugging software will need indication of the beginning and end of a transactional region; this will allow software to understand when instructions are part of a transactional region and whether that region has been committed.

To enable this, TSX information is included in a MODE packet leaf. The mode bits in the leaf are:

- **InTX**: Set to 1 on an TSX transaction begin, and cleared on transaction commit or abort.
- **TXAbort**: Set to 1 only when InTX transitions from 1 to 0 on an abort. Cleared otherwise.

If BranchEn=1, this MODE packet will be sent each time the transaction status changes. See Table 35-10 for details.

**Table 35-10. TSX Packet Scenarios**

| TSX Event          | Instruction   | Packets  |
|--------------------|---|--|
| Transaction Begin  | Either XBEGIN or XACQUIRE lock (the latter if executed transactionally)   | MODE(TXAbort=0, InTX=1), FUP(CurrentIP)                |
| Transaction Commit | Either XEND or XRELEASE lock, if transactional execution ends. This happens only on the outermost commit  | MODE(TXAbort=0, InTX=0), FUP(CurrentIP)                |
| Transaction Abort  | XABORT or other transactional abort   | MODE(TXAbort=1, InTX=0), FUP(CurrentIP), TIP(TargetIP) |
| Other              | One of the following: <ul style="list-style-type: none"> <li>▪ Nested XBEGIN or XACQUIRE lock</li> <li>▪ An outer XACQUIRE lock that doesn't begin a transaction (InTX not set)</li> <li>▪ Non-outermost XEND or XRELEASE lock</li> </ul> | None. No change to TSX mode bits for these cases.      |

The CurrentIP listed above is the IP of the associated instruction. The TargetIP is the IP of the next instruction to be executed; for HLE, this is the XACQUIRE lock; for RTM, this is the fallback handler.

Intel PT stores are non-transactional, and thus packet writes are not rolled back on TSX abort.

### 35.2.8.2 TSX and IP Filtering

A complication with tracking transactions is handling transactions that start or end outside of the tracing region. Transactions can't span across a change in ContextEn, because CPL changes and CR3 changes each cause aborts. But a transaction can start within the IP filter region and end outside it.

To assist the decoder handling this situation, MODE.TSX packets can be sent even if FilterEn=0, though there will be no FUP attached. Instead, they will merely serve to indicate to the decoder when transactions are active and when they are not. When tracing resumes (due to PacketEn=1), the last MODE.TSX preceding the TIP.PGE will indicate the current transaction status.

### 35.2.8.3 System Management Mode (SMM)

SMM code has special privileges that non-SMM code does not have. Intel Processor Trace can be used to trace SMM code, but special care is taken to ensure that SMM handler context is not exposed in any non-SMM trace collection. Additionally, packet output from tracing non-SMM code cannot be written into memory space that is either protected by SMRR or used by the SMM handler.

SMM is entered via a system management interrupt (SMI). SMI delivery saves the value of IA32\_RTIT\_CTL.TraceEn into SMRAM and then clears it, thereby disabling packet generation.

The saving and clearing of IA32\_RTIT\_CTL.TraceEn ensures two things:

1. All internally buffered packet data is flushed before entering SMM (see Section 35.2.7.2).
2. Packet generation ceases before entering SMM, so any tracing that was configured outside SMM does not continue into SMM. No SMM instruction pointers or other state will be exposed in the non-SMM trace.

When the RSM instruction is executed to return from SMM, the TraceEn value that was saved by SMI delivery is restored, allowing tracing to be resumed. As is done any time packet generation is enabled, ContextEn is re-evaluated, based on the values of CPL, CR3, etc., established by RSM.

Like other interrupts, delivery of an SMI produces a FUP containing the IP of the next instruction to execute. By toggling TraceEn, SMI and RSM can produce TIP.PGD and TIP.PGE packets, respectively, indicating that tracing was disabled or re-enabled. See Table 35.7 for more information about packets entering and leaving SMM.

Although #SMI and RSM change CR3, PIP packets are not generated in these cases. With #SMI tracing is disabled before the CR3 change; with RSM TraceEn is restored after CR3 is written.

TraceEn must be cleared before executing RSM, otherwise it will cause a shutdown. Further, on processors that restrict use of Intel PT with LBRs (see Section 35.3.1.2), any RSM that results in enabling of both will cause a shutdown.

Intel PT can support tracing of System Transfer Monitor operating in SMM, see Section 35.6.

### 35.2.8.4 Virtual-Machine Extensions (VMX)

Initial implementations of Intel Processor Trace do not support tracing in VMX operation. Such processors indicate this by returning 0 for IA32\_VMX\_MISC[bit 14]. On these processors, execution of the VMXON instruction clears IA32\_RTIT\_CTL.TraceEn and any attempt to write IA32\_RTIT\_CTL in VMX operation causes a general-protection exception (#GP).

Processors that support Intel Processor Trace in VMX operation return 1 for IA32\_VMX\_MISC[bit 14]. Details of tracing in VMX operation are described in Section 35.5.

### 35.2.8.5 Intel Software Guard Extensions (SGX)

SGX provides an application with ability to instantiate a protective container (an enclave) with confidentiality and integrity (see *Intel® Software Guard Extensions Programming Reference*). On a processor with both Intel PT and SGX enabled, when executing code within a production enclave, no control flow packets are produced by Intel PT. Enclave entry will clear ContextEn, thereby blocking control flow packet generation. A TIP.PGD packet will be generated if PacketEn=1 at the time of the entry.

Upon enclave exit, ContextEn will no longer be forced to 0. If other enables are set at the time, a TIP.PGE may be generated to indicate that tracing is resumed.

During the enclave execution, Intel PT remains enabled, and periodic or timing packets such as PSB, TSC, MTC, or CBR can still be generated. No IPs or other architectural state will be exposed.

For packet generation examples on enclave entry or exit, see Section 35.7.

### Debug Enclaves

SGX allows an enclave to be configured with relaxed protection of confidentiality for debug purposes, see *Intel® Software Guard Extensions Programming Reference*. In a debug enclave, Intel PT continues to function normally. Specifically, ContextEn is not impacted by enclave entry or exit. Hence the generation of ContextEn-dependent packets within a debug enclave is allowed.

#### 35.2.8.6 SENTER/ENTERACCS and ACM

GETSEC[SENDER] and GETSEC[ENTERACCS] instructions clear TraceEn, and it is not restored when those instruction complete. SENTER also causes TraceEn to be cleared on other logical processors when they rendezvous and enter the SENTER sleep state. In these two cases, the disabling of packet generation is not guaranteed to flush internally buffered packets. Some packets may be dropped.

When executing an authenticated code module (ACM), packet generation is silently disabled during ACRAM setup. TraceEn will be cleared, but no TIP.PGD packet is generated. After completion of the module, the TraceEn value will be restored. There will be no TIP.PGE packet, but timing packets, like TSC and CBR, may be produced.

#### 35.2.8.7 Intel® Memory Protection Extensions (Intel® MPX)

Bounds exceptions (#BR) caused by Intel MPX are treated like other exceptions, producing FUP and TIP packets that indicate the source and destination IPs.

## 35.3 CONFIGURATION AND PROGRAMMING GUIDELINE

### 35.3.1 Detection of Intel Processor Trace and Capability Enumeration

Processor support for Intel Processor Trace is indicated by CPUID.(EAX=07H,ECX=0H):EBX[bit 25] = 1. CPUID function 14H is dedicated to enumerate the resource and capability of processors that report CPUID.(EAX=07H,ECX=0H):EBX[bit 25] = 1. Different processor generations may have architecturally-defined variation in capabilities. Table 35-11 describes details of the enumerable capabilities that software must use across generations of processors that support Intel Processor Trace.

**Table 35-11. CPUID Leaf 14H Enumeration of Intel Processor Trace Capabilities**

| CPUID.(EAX=14H,ECX=0) |      | Name   | Description Behavior  |
|-----------------------|------|--|---|
| Register              | Bits |  |   |
| EAX                   | 31:0 | Maximum valid sub-leaf Index   | Specifies the index of the maximum valid sub-leaf for this CPUID leaf   |
| EBX                   | 0    | CR3 Filtering Support  | 1: Indicates that IA32_RTIT_CTL.CR3Filter can be set to 1, and that IA32_RTIT_CR3_MATCH MSR can be accessed. See Section 35.2.7.<br>0: Indicates that writes that set IA32_RTIT_CTL.CR3Filter to 1, or any access to IA32_RTIT_CR3_MATCH, will #GP fault.   |
|                       | 1    | Configurable PSB and Cycle-Accurate Mode Supported                                 | 1: (a) IA32_RTIT_CTL.PSBFreq can be set to a non-zero value, in order to select the preferred PSB frequency (see below for allowed values). (b) IA32_RTIT_STATUS.PacketByteCnt can be set to a non-zero value, and will be incremented by the processor when tracing to indicate progress towards the next PSB. If trace packet generation is enabled by setting TraceEn, a PSB will only be generated if PacketByteCnt=0. (c) IA32_RTIT_CTL.CYCEn can be set to 1 to enable Cycle-Accurate Mode. See Section 35.2.7.<br>0: (a) Any attempt to set IA32_RTIT_CTL.PSBFreq, to set IA32_RTIT_CTL.CYCEn, or write a non-zero value to IA32_RTIT_STATUS.PacketByteCnt any access to IA32_RTIT_CR3_MATCH, will #GP fault. (b) If trace packet generation is enabled by setting TraceEn, a PSB is always generated. (c) Any attempt to set IA32_RTIT_CTL.CYCEn will #GP fault.    |
|                       | 2    | IP Filtering and TraceStop supported, and Preserve Intel PT MSRs across warm reset | 1: (a) IA32_RTIT_CTL provides at one or more ADDRn_CFG field to configure the corresponding address range MSRs for IP Filtering or IP TraceStop. Each ADDRn_CFG field accepts a value in the range of 0:2 inclusive. The number of ADDRn_CFG fields is reported by CPUID.(EAX=14H, ECX=1):EAX.RANGECONT[2:0]. (b) At least one register pair IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B are provided to configure address ranges for IP filtering or IP TraceStop. (c) On warm reset, all Intel PT MSRs will retain their pre-reset values, though IA32_RTIT_CTL.TraceEn will be cleared. The Intel PT MSRs are listed in Section 35.2.7.<br>0: (a) An Attempt to write IA32_RTIT_CTL.ADDRn_CFG with non-zero encoding values will cause #GP. (b) Any access to IA32_RTIT_ADDRn_A and IA32_RTIT_ADDRn_B, will #GP fault. (c) On warm reset, all Intel PT MSRs will be cleared. |
|                       | 3    | MTC Supported  | 1: IA32_RTIT_CTL.MTCEn can be set to 1, and MTC packets will be generated. See Section 35.2.7.<br>0: An attempt to set IA32_RTIT_CTL.MTCEn or IA32_RTIT_CTL.MTCFreq to a non-zero value will #GP fault.   |
|                       | 4    | PTWRITE Supported  | 1: Writes can set IA32_RTIT_CTL[12] (PTWEn) and IA32_RTIT_CTL[5] (FUPonPTW), and PTWRITE can generate packets.<br>0: Writes that set IA32_RTIT_CTL[12] or IA32_RTIT_CTL[5] will #GP, and PTWRITE will #UD fault.  |
|                       | 5    | Power Event Trace Supported  | 1: Writes can set IA32_RTIT_CTL[4] (PwrEvtEn), enabling Power Event Trace packet generation.<br>0: Writes that set IA32_RTIT_CTL[4] will #GP.   |
|                       | 31:6 | Reserved   |   |

**Table 35-11. CPUID Leaf 14H Enumeration of Intel Processor Trace Capabilities (Contd.)**

| CPUID.(EAX=14H,ECX=0) |      | Name  | Description Behavior   |
|-----------------------|------|---|--|
| Register              | Bits |   |  |
| ECX                   | 0    | ToPA Output Supported                         | 1: Tracing can be enabled with IA32_RTIT_CTL.ToPA = 1, hence utilizing the ToPA output scheme (Section 35.2.6.2) IA32_RTIT_OUTPUT_BASE and IA32_RTIT_OUTPUT_MASK_PTRS MSRs can be accessed.<br>0: Unless CPUID.(EAX=14H, ECX=0):ECX.SNGLRNGOUT[bit 2] = 1. writes to IA32_RTIT_OUTPUT_BASE or IA32_RTIT_OUTPUT_MASK_PTRS. MSRs will #GP fault.   |
|                       | 1    | ToPA Tables Allow Multiple Output Entries     | 1: ToPA tables can hold any number of output entries, up to the maximum allowed by the MaskOrTableOffset field of IA32_RTIT_OUTPUT_MASK_PTRS.<br>0: ToPA tables can hold only one output entry, which must be followed by an END=1 entry which points back to the base of the table.<br>Further, ToPA PMIs will be delivered before the region is filled. See ToPA PMI in Section 35.2.6.2.<br>If there is more than one output entry before the END entry, or if the END entry has the wrong base address, an operational error will be signaled (see “ToPA Errors” in Section 35.2.6.2). |
|                       | 2    | Single-Range Output Supported                 | 1: Enabling tracing (TraceEn=1) with IA32_RTIT_CTL.ToPA=0 is supported.<br>0: Unless CPUID.(EAX=14H, ECX=0):ECX.TOPAOUT[bit 0] = 1. writes to IA32_RTIT_OUTPUT_BASE or IA32_RTIT_OUTPUT_MASK_PTRS. MSRs will #GP fault.  |
|                       | 3    | Output to Trace Transport Subsystem Supported | 1: Setting IA32_RTIT_CTL.FabricEn to 1 is supported.<br>0: IA32_RTIT_CTL.FabricEn is reserved. Write 1 to IA32_RTIT_CTL.FabricEn will #GP fault.   |
|                       | 30:4 | Reserved                                      |  |
|                       | 31   | IP Payloads are LIP                           | 1: Generated packets which contain IP payloads have LIP values, which include the CS base component.<br>0: Generated packets which contain IP payloads have RIP values, which are the offset from CS base.   |
| EDX                   | 31:0 | Reserved                                      |  |

If CPUID.(EAX=14H, ECX=0):EAX reports a non-zero value, additional capabilities of Intel Processor Trace are described in the sub-leaves of CPUID leaf 14H.

**Table 35-12. CPUID Leaf 14H, sub-leaf 1H Enumeration of Intel Processor Trace Capabilities**

| CPUID.(EAX=14H,ECX=1) |       | Name  | Description Behavior   |
|-----------------------|-------|---|--|
| Register              | Bits  |   |  |
| EAX                   | 2:0   | Number of Address Ranges                                | A non-zero value specifies the number ADDRn_CFG field supported in IA32_RTIT_CTL and the number of register pair IA32_RTIT_ADDRn_A/IA32_RTIT_ADDRn_B supported for IP filtering and IP TraceStop.<br><b>NOTE:</b> Currently, no processors support more than 4 address ranges.   |
|                       | 15:3  | Reserved  |  |
|                       | 31:16 | Bitmap of supported MTC Period Encodings                | The non-zero bit positions indicate the map of supported encoding values for the IA32_RTIT_CTL.MTCFreq field. This applies only if CPUID.(EAX=14H, ECX=0):EBX.MTC[bit 3] = 1 (MTC Packet generation is supported), otherwise the MTCFreq field is reserved to 0.<br>Each bit position in this field represents 1 encoding value in the 4-bit MTCFreq field (ie, bit 0 is associated with encoding value 0). For each bit:<br>1: MTCFreq can be assigned the associated encoding value.<br>0: MTCFreq cannot be assigned to the associated encoding value. A write to IA32_RTIT_CTL.MTCFreq with unsupported encoding will cause #GP fault.               |
| EBX                   | 15:0  | Bitmap of supported Cycle Threshold values              | The non-zero bit positions indicate the map of supported encoding for the IA32_RTIT_CTL.CycThresh field. This applies only if CPUID.(EAX=14H, ECX=0):EBX.CPSB_CAM[bit 1] = 1 (Cycle-Accurate Mode is Supported), otherwise the CycThresh field is reserved to 0. See Section 35.2.7.<br>Each bit position in this field represents 1 encoding value in the 4-bit CycThresh field (ie, bit 0 is associated with encoding value 0). For each bit:<br>1: CycThresh can be assigned the associated encoding value.<br>0: CycThresh cannot be assigned to the associated encoding value. A write to CycThresh with unsupported encoding will cause #GP fault. |
|                       | 31:16 | Bitmap of supported Configurable PSB Frequency encoding | The non-zero bit positions indicate the map of supported encoding for the IA32_RTIT_CTL.PSBFreq field. This applies only if CPUID.(EAX=14H, ECX=0):EBX.CPSB_CAM[bit 1] = 1 (Configurable PSB is supported), otherwise the PSBFreq field is reserved to 0. See Section 35.2.7.<br>Each bit position in this field represents 1 encoding value in the 4-bit PSBFreq field (ie, bit 0 is associated with encoding value 0). For each bit:<br>1: PSBFreq can be assigned the associated encoding value.<br>0: PSBFreq cannot be assigned to the associated encoding value. A write to PSBFreq with unsupported encoding will cause #GP fault.                |
| ECX                   | 31:0  | Reserved  |  |
| EDX                   | 31:0  | Reserved  |  |

### 35.3.1.1 Packet Decoding of RIP versus LIP

FUP, TIP, TIP.PGE, and TIP.PGE packets can contain an instruction pointer (IP) payload. On some processor generations, this payload will be an effective address (RIP), while on others this will be a linear address (LIP). In the former case, the payload is the offset from the current CS base address, while in the latter it is the sum of the offset and the CS base address (Note that in real mode, the CS base address is the value of CS<<4, while in protected mode the CS base address is the base linear address of the segment indicated by the CS register.). Which IP type is in use is indicated by enumeration (see CPUID.(EAX=14H, ECX=0):ECX.LIP[bit 31] in Table 35-11).

For software that executes while the CS base address is 0 (including all software executing in 64-bit mode), the difference is indistinguishable. A trace decoder must account for cases where the CS base address is not 0 and the resolved LIP will not be evident in a trace generated on a CPU that enumerates use of RIP. This is likely to cause problems when attempting to link the trace with the associated binaries.

Note that IP comparison logic, for IP filtering and TraceStop range calculation, is based on the same IP type as these IP packets. For processors that output RIP, the IP comparison mechanism is also based on RIP, and hence on those processors RIP values should be written to IA32\_RTIT\_ADDRn\_[AB] MSRs. This can produce differing behavior if the same trace configuration setting is run on processors reporting different IP types, i.e. CPUID.(EAX=14H, ECX=0):ECX.LIP[bit 31]. Care should be taken to check CPUID when configuring IP filters.

### 35.3.1.2 Model Specific Capability Restrictions

Some processor generations impose restrictions that prevent use of LBRs/BTS/BTM/LEAs when software has enabled tracing with Intel Processor Trace. On these processors, when TraceEn is set, updates of LBR, BTS, BTM, LEAs are suspended but the states of the corresponding IA32\_DEBUGCTL control fields remained unchanged as if it were still enabled. When TraceEn is cleared, the LBR array is reset, and LBR/BTS/BTM/LEAs updates will resume. Further, reads of these registers will return 0, and writes will be dropped.

The list of MSRs whose updates/accesses are restricted follows.

- MSR\_LASTBRANCH\_x\_TO\_IP, MSR\_LASTBRANCH\_x\_FROM\_IP, MSR\_LBR\_INFO\_x, MSR\_LASTBRANCH\_TOS
- MSR\_LER\_FROM\_LIP, MSR\_LER\_TO\_LIP
- MSR\_LBR\_SELECT

For processor with CPUID DisplayFamily\_DisplayModel signature of 06\_3DH, 06\_47H, 06\_4EH, 06\_4FH, 06\_56H and 06\_5EH, the use of Intel PT and LBRs are mutually exclusive.

## 35.3.2 Enabling and Configuration of Trace Packet Generation

To configure trace packets, enable packet generation, and capture packets, software starts with using CPUID instruction to detect its feature flag, CPUID.(EAX=07H, ECX=0H):EBX[bit 25] = 1; followed by enumerating the capabilities described in Section 35.3.1.

Based on the capability queried from Section 35.3.1, software must configure a number of model-specific registers. This section describes programming considerations related to those MSRs.

### 35.3.2.1 Enabling Packet Generation

When configuring and enabling packet generation, the IA32\_RTIT\_CTL MSR should be written after any other Intel PT MSRs have been written, since writes to the other configuration MSRs cause a general-protection fault (#GP) if TraceEn = 1. If a prior trace collection context is not being restored, then software should first clear IA32\_RTIT\_STATUS. This is important since the Stopped, and Error fields are writable; clearing the MSR clears any values that may have persisted from prior trace packet collection contexts. See Section 35.2.7.2 for details of packets generated by setting TraceEn to 1.

If setting TraceEn to 1 causes an operational error (see Section 35.3.9), there may be a delay after the WRMSR completes before the error is signaled in the IA32\_RTIT\_STATUS MSR.

While packet generation is enabled, the values of some configuration MSRs (e.g., IA32\_RTIT\_STATUS and IA32\_RTIT\_OUTPUT\_\*) are transient, and reads may return values that are out of date. Only after packet generation is disabled (by clearing TraceEn) do reads of these MSRs return reliable values.

### 35.3.2.2 Disabling Packet Generation

After disabling packet generation by clearing IA32\_RTIT\_CTL, it is advisable to read the IA32\_RTIT\_STATUS MSR (Section 35.2.7.4):

- If the Error bit is set, an operational error was encountered, and the trace is most likely compromised. Software should check the source of the error (by examining the output MSR values), correct the source of the problem, and then attempt to gather the trace again. For details on operational errors, see Section 35.3.9. Software should clear IA32\_RTIT\_STATUS.Error before re-enabling packet generation.
- If the Stopped bit is set, software execution encountered an IP TraceStop (see Section 35.2.4.3) or the ToPA Stop condition (see “ToPA STOP” in Section 35.2.6.2) before packet generation was disabled.

### 35.3.3 Flushing Trace Output

Packets are first buffered internally and then written out asynchronously. To collect packet output for post-processing, a collector needs first to ensure that all packet data has been flushed from internal buffers. Software can ensure this by stopping packet generation by clearing IA32\_RTIT\_CTL.TraceEn (see “Disabling Packet Generation” in Section 35.2.7.2).

When software clears IA32\_RTIT\_CTL.TraceEn to flush out internally buffered packets, the logical processor issues an SFENCE operation which ensures that WC trace output stores will be ordered with respect to the next store, or serializing operation. A subsequent read from the same logical processor will see the flushed trace data, while a read from another logical processor should be preceded by a store, fence, or architecturally serializing operation on the tracing logical processor.

When the flush operations complete, the IA32\_RTIT\_OUTPUT\_\* MSR values indicate where the trace ended. While TraceEn is set, these MSRs may hold stale values. Further, if a ToPA region with INT=1 is filled, meaning a ToPA PMI has been triggered, IA32\_PERF\_GLOBAL\_STATUS.Trace\_ToPA\_PMI[55] will be set by the time the flush completes.

### 35.3.4 Warm Reset

The MSRs software uses to program Intel Processor Trace are cleared after a power-on RESET (or cold RESET). On a warm RESET, the contents of those MSRs can retain their values from before the warm RESET with the exception that IA32\_RTIT\_CTL.TraceEn will be cleared (which may have the side effect of clearing some bits in IA32\_RTIT\_STATUS).

### 35.3.5 Context Switch Consideration

To facilitate construction of instruction execution traces at the granularity of a software process or thread context, software can save and restore the states of the trace configuration MSRs across the process or thread context switch boundary. The principle is the same as saving and restoring the typical architectural processor states across context switches.

#### 35.3.5.1 Manual Trace Configuration Context Switch

The configuration can be saved and restored through a sequence of instructions of RDMSR, management of MSR content and WRMSR. To stop tracing and to ensure that all configuration MSRs contain stable values, software must clear IA32\_RTIT\_CTL.TraceEn before reading any other trace configuration MSRs. The recommended method for saving trace configuration context manually follows:

1. RDMSR IA32\_RTIT\_CTL, save value to memory
2. WRMSR IA32\_RTIT\_CTL with saved value from RDMSR above and TraceEn cleared
3. RDMSR all other configuration MSRs whose values had changed from previous saved value, save changed values to memory

When restoring the trace configuration context, IA32\_RTIT\_CTL should be restored last:

1. Read saved configuration MSR values, aside from IA32\_RTIT\_CTL, from memory, and restore them with WRMSR
2. Read saved IA32\_RTIT\_CTL value from memory, and restore with WRMSR.

### 35.3.5.2 Trace Configuration Context Switch Using XSAVES/XRSTORS

On processors whose XSAVE feature set supports XSAVES and XRSTORS, the Trace configuration state can be saved using XSAVES and restored by XRSTORS, in conjunction with the bit field associated with supervisory state component in IA32\_XSS. See Chapter 13, “Managing State Using the XSAVE Feature Set” of *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1*.

The layout of the trace configuration component state in the XSAVE area is shown in Table 35-13.<sup>1</sup>

**Table 35-13. Memory Layout of the Trace Configuration State Component**

| Offset within Component Area | Field                      | Offset within Component Area | Field                 |
|------------------------------|----------------------------|------------------------------|-----------------------|
| 0H                           | IA32_RTIT_CTL              | 08H                          | IA32_RTIT_OUTPUT_BASE |
| 10H                          | IA32_RTIT_OUTPUT_MASK_PTRS | 18H                          | IA32_RTIT_STATUS      |
| 20H                          | IA32_RTIT_CR3_MATCH        | 28H                          | IA32_RTIT_ADDR0_A     |
| 30H                          | IA32_RTIT_ADDR0_B          | 38H                          | IA32_RTIT_ADDR1_A     |
| 40H                          | IA32_RTIT_ADDR1_B          | 48H-End                      | Reserved              |

The IA32\_XSS MSR is zero coming out of RESET. Once IA32\_XSS[bit 8] is set, system software operating at CPL=0 can use XSAVES/XRSTORS with the appropriate requested-feature bitmap (RFBM) to manage supervisor state components in the XSAVE map. See Chapter 13, “Managing State Using the XSAVE Feature Set” of *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 1*.

### 35.3.6 Cycle-Accurate Mode

Intel PT can be run in a cycle-accurate mode which enables CYC packets (see Section 35.4.2.14) that provide low-level information in the processor core clock domain. This cycle counter data in CYC packets can be used to compute IPC (Instructions Per Cycle), or to track wall-clock time on a fine-grain level.

To enable cycle-accurate mode packet generation, software should set IA32\_RTIT\_CTL.CYCEn=1. It is recommended that software also set TSCEn=1 anytime cycle-accurate mode is in use. With this, all CYC-eligible packets will be preceded by a CYC packet, the payload of which indicates the number of core clock cycles since the last CYC packet. In cases where multiple CYC-eligible packets are generated in a single cycle, only a single CYC will be generated before the CYC-eligible packets, otherwise each CYC-eligible packet will be preceded by its own CYC. The CYC-eligible packets are:

- TNT, TIP, TIP.PGE, TIP.PGD, MODE.EXEC, MODE.TSX, PIP, VMCS, OVF, MTC, TSC, PTWRITE, EXSTOP

TSC packets are generated when there is insufficient information to reconstruct wall-clock time, due to tracing being disabled (TriggerEn=0), or power down scenarios like a transition to a deep-sleep MWAIT C-state. In this case, the CYC that is generated along with the TSC will indicate the number of cycles actively tracing (those powered up, with TriggerEn=1) executed between the last CYC packet and the TSC packet. And hence the amount of time spent while tracing is inactive can be inferred from the difference in time between that expected based on the CYC value, and the actual time indicated by the TSC.

Additional CYC packets may be sent stand-alone, so that the processor can ensure that the decoder is aware of the number of cycles that have passed before the internal hardware counter wraps, or is reset due to other micro-architectural condition. There is no guarantee at what intervals these standalone CYC packets will be sent, except that they will be sent before the wrap occurs. An illustration is given below.

1. Table 35-13 documents support for the MSRs defining address ranges 0 and 1. Processors that provide XSAVE support for Intel Processor Trace support only those address ranges.

**Example 35-1. An Illustrative CYC Packet Example**

| Time (cycles) | Instruction Snapshot | Generated Packets | Comment   |
|---------------|----------------------|-------------------|---|
| x             | call %eax            | CYC(?), TIP       | ?Elapsed cycles from the previous CYC unknown             |
| x + 2         | call %ebx            | CYC(2), TIP       | 1 byte CYC packet; 2 cycles elapsed from the previous CYC |
| x + 8         | jnz Foo (not taken)  | CYC(6)            | 1 byte CYC packet   |
| x + 9         | ret (compressed)     |                   |   |
| x + 12        | jnz Bar (taken)      |                   |   |
| x + 16        | ret (uncompressed)   | TNT, CYC(8), TIP  | 1 byte CYC packet   |
| x + 4111      |                      | CYC(4095)         | 2 byte CYC packet   |
| x + 12305     |                      | CYC(8194)         | 3 byte CYC packet   |
| x + 16332     | mov cr3, %ebx        | CYC(4027), PIP    | 2 byte CYC packet   |

**35.3.6.1 Cycle Counter**

The cycle counter is implemented in hardware (independent of the time stamp counter or performance monitoring counters), and is a simple incrementing counter that does not saturate, but rather wraps. The size of the counter is implementation specific.

The cycle counter is reset to zero any time that TriggerEn is cleared, and when a CYC packet is sent. The cycle counter will continue to count when ContextEn or FilterEn are cleared, and cycle packets will still be generated. It will not count during sleep states that result in Intel PT logic being powered-down, but will count up to the point where clocks are disabled, and resume counting once they are re-enabled.

**35.3.6.2 Cycle Packet Semantics**

Cycle-accurate mode adheres to the following protocol:

- All packets that precede a CYC packet represent instructions or events that took place before the CYC time.
- All packets that follow a CYC packet represent instructions or events that took place at the same time as, or after, the CYC time.
- The CYC-eligible packet that immediately follows a CYC packet represents an instruction or event that took place at the same time as the CYC time.

These items above give the decoder a means to apply CYC packets to a specific instruction in the assembly stream. Most packets represent a single instruction or event, and hence the CYC packet that precedes each of those packets represents the retirement time of that instruction or event. In the case of TNT packets, up to 6 conditional branches and/or compressed RETs may be contained in the packet. In this case, the preceding CYC packet provides the retirement time of the first branch in the packet. It is possible that multiple branches retired in the same cycle as that first branch in the TNT, but the protocol will not make that obvious. Also note that a MTC packet could be generated in the same cycle as the first JCC in the TNT packet. In this case, the CYC would precede both the MTC and the TNT, and apply to both.

Note that there are times when the cycle counter will stop counting, though cycle-accurate mode is enabled. After any such scenario, a CYC packet followed by TSC packet will be sent. See Section 35.8.3.2 to understand how to interpret the payload values

**Multi-packet Instructions or Events**

Some operations, such as interrupts or task switches, generate multiple packets. In these cases, multiple CYC packets may be sent for the operation, preceding each CYC-eligible packet in the operation. An example, using a task switch on a software interrupt, is shown below.

**Example 35-2. An Example of CYC in the Presence of Multi-Packet Operations**

| Time (cycles) | Instruction Snapshot | Generated Packets                               |
|---------------|----------------------|---|
| x             | jnz Foo (not taken)  | CYC(?),   |
| x + 2         | ret (compressed)     |   |
| x + 8         | jnz Bar (taken)      |   |
| x + 9         | jmp %eax             | TNT, CYC(9), TIP                                |
| x + 12        | jnz Bar (not taken)  | CYC(3)  |
| x + 32        | int3 (task gate)     | TNT, FUP, CYC(10), PIP, CYC(20), MODE.Exec, TIP |

### 35.3.6.3 Cycle Thresholds

Software can opt to reduce the frequency of cycle packets, a trade-off to save bandwidth and intrusion at the expense of precision. This is done by utilizing a cycle threshold (see Section 35.2.7.2).

IA32\_RTIT\_CTL.CycThresh indicates to the processor the minimum number of cycles that must pass before the next CYC packet should be sent. If this value is 0, no threshold is used, and CYC packets can be sent every cycle in which a CYC-eligible packet is generated. If this value is greater than 0, the hardware will wait until the associated number of cycles have passed since the last CYC packet before sending another. CPUID provides the threshold options for CycThresh, see Section 35.3.1.

Note that the cycle threshold does not dictate how frequently a CYC packet will be posted, it merely assigns the maximum frequency. If the cycle threshold is 16, a CYC packet can be posted no more frequently than every 16 cycles. However, once that threshold of 16 cycles has passed, it still requires a new CYC-eligible packet to be generated before a CYC will be inserted. Table 35-14 illustrates the threshold behavior.

**Table 35-14. An Illustrative CYC Packet Example**

| Time (cycles) | Instruction Snapshot | Threshold |          |          |          |
|---------------|----------------------|-----------|----------|----------|----------|
|               |                      | 0         | 16       | 32       | 64       |
| x             | jmp %eax             | CYC, TIP  | CYC, TIP | CYC, TIP | CYC, TIP |
| x + 9         | call %ebx            | CYC, TIP  | TIP      | TIP      | TIP      |
| x + 15        | call %ecx            | CYC, TIP  | TIP      | TIP      | TIP      |
| x + 30        | jmp %edx             | CYC, TIP  | CYC, TIP | TIP      | TIP      |
| x + 38        | mov cr3, %eax        | CYC, PIP  | PIP      | CYC, PIP | PIP      |
| x + 46        | jmp [%eax]           | CYC, TIP  | CYC, TIP | TIP      | TIP      |
| x + 64        | call %edx            | CYC, TIP  | CYC, TIP | TIP      | CYC, TIP |
| x + 71        | jmp %edx             | CYC, TIP  | TIP      | CYC, TIP | TIP      |

### 35.3.7 Decoder Synchronization (PSB+)

The PSB packet (Section 35.4.2.17) serves as a synchronization point for a trace-packet decoder. It is a pattern in the trace log for which the decoder can quickly scan to align packet boundaries. No legal packet combination can result in such a byte sequence. As such, it serves as the starting point for packet decode. To decode a trace log properly, the decoder needs more than simply to be aligned: it needs to know some state and potentially some timing information as well. The decoder should never need to retain any information (e.g., LastIP, call stack, compound packet event) across a PSB; all compound packet events will be completed before a PSB, and any compression state will be reset.

When a PSB packet is generated, it is followed by a PSBEND packet (Section 35.4.2.18). One or more packets may be generated in between those two packets, and these inform the decoder of the current state of the processor. These packets, known collectively as PSB+, should be interpreted as “status only”, since they do not imply any change of state at the time of the PSB, nor are they associated directly with any instruction or event. Thus, the

normal binding and ordering rules that apply to these packets outside of PSB+ can be ignored when these packets are between a PSB and PSBEND. They inform the decoder of the state of the processor at the time of the PSB.

PSB+ can include:

- Timestamp (TSC), if IA32\_RTIT\_CTL.TSCEn=1.
- Timestamp-MTC Align (TMA), if IA32\_RTIT\_CTL.TSCEn=1 && IA32\_RTIT\_CTL.MTCEn=1.
- Paging Info Packet (PIP), if ContextEn=1 and IA32\_RTIT\_CTL.OS=1. The non-root bit (NR) is set if the logical processor is in VMX non-root operation and the “conceal VMX from PT” VM-execution control is 0.
- VMCS packet, if either the logical is in VMX root operation or the logical processor is in VMX non-root operation and the “conceal VMX from PT” VM-execution control is 0.
- Core Bus Ratio (CBR).
- MODE.TSX, if ContextEn=1 and BranchEn = 1.
- MODE.Exec, if PacketEn=1.
- Flow Update Packet (FUP), if PacketEn=1.

PSB is generated only when TriggerEn=1; hence PSB+ has the same dependencies. The ordering of packets within PSB+ is not fixed. Timing packets such as CYC and MTC may be generated between PSB and PSBEND, and their meanings are the same as outside PSB+.

A PSB+ can be lost in some scenarios. If IA32\_RTIT\_STATUS.TriggerEn is cleared just as the PSB threshold is reached, the PSB+ may not be generated. TriggerEn can be cleared by a WRMSR that clears IA32\_RTIT\_CTL.TraceEn, a VM-exit that clears IA32\_RTIT\_CTL.TraceEn, an #SMI, or any time that either IA32\_RTIT\_STATUS.Stopped is set (e.g., by a TraceStop or ToPA stop condition) or IA32\_RTIT\_STATUS.Error is set (e.g., by an Intel PT output error).

Note that an overflow can occur during PSB+, and this could cause the PSBEND packet to be lost. For this reason, the OVF packet should also be viewed as terminating PSB+.

### 35.3.8 Internal Buffer Overflow

In the rare circumstances when new packets need to be generated but the processor’s dedicated internal buffers are all full, an “internal buffer overflow” occurs. On such an overflow packet generation ceases (as packets would need to enter the processor’s internal buffer) until the overflow resolves. Once resolved, packet generation resumes.

When the buffer overflow is cleared, an OVF packet (Section 35.4.2.16) is generated, and the processor ensures that packets which follow the OVF are not compressed (IP compression or RET compression) against packets that were lost.

If IA32\_RTIT\_CTL.BranchEn = 1, the OVF packet will be followed by a FUP if the overflow resolves while PacketEn=1. If the overflow resolves while PacketEn = 0 no packet is generated, but a TIP.PGE will naturally be generated later, once PacketEn = 1. The payload of the FUP or TIP.PGE will be the Current IP of the first instruction upon which tracing resumes after the overflow is cleared. If the overflow resolves while PacketEn=1, only timing packets may come between the OVF and the FUP. If the overflow resolves while PacketEn=0, any other packets that are not dependent on PacketEn may come between the OVF and the TIP.PGE.

#### 35.3.8.1 Overflow Impact on Enables

The address comparisons to ADDRn ranges, for IP filtering and TraceStop (Section 35.2.4.3), continue during a buffer overflow, and TriggerEn, ContextEn, and FilterEn may change during a buffer overflow. Like other packets, however, any TIP.PGE or TIP.PGD packets that would have been generated will be lost. Further, IA32\_RTIT\_STATUS.PacketByteCnt will not increment, since it is only incremented when packets are generated.

If a TraceStop event occurs during the buffer overflow, IA32\_RTIT\_STATUS.Stopped will still be set, tracing will cease as a result. However, the TraceStop packet, and any TIP.PGD that result from the TraceStop, may be dropped.

### 35.3.8.2 Overflow Impact on Timing Packets

Any timing packets that are generated during a buffer overflow will be dropped. If only a few MTC packets are dropped, a decoder should be able to detect this by noticing that the time value in the first MTC packet after the buffer overflow incremented by more than one. If the buffer overflow lasted long enough that 256 MTC packets are lost (and thus the MTC packet ‘wraps’ its 8-bit CTC value), then the decoder may be unable to properly understand the trace. This is not an expected scenario. No CYC packets are generated during overflow, even if the cycle counter wraps.

Note that, if cycle-accurate mode is enabled, the OVF packet will generate a CYC packet. Because the cycle counter counts during overflows, this CYC packet can provide the duration of the overflow. However, there is a risk that the cycle counter wrapped during the overflow, which could render this CYC misleading.

### 35.3.9 Operational Errors

Errors are detected as a result of packet output configuration problems, which can include output alignment issues, ToPA reserved bit violations, or overlapping packet output with restricted memory. See “ToPA Errors” in Section 35.2.6.2 for details on ToPA errors, and Section 35.2.6.4 for details on restricted memory errors. Operational errors are only detected and signaled when TraceEn=1.

When an operational error is detected, tracing is disabled and the error is logged. Specifically, IA32\_RTIT\_STATUS.Error is set, which will cause IA32\_RTIT\_STATUS.TriggerEn to be 0. This will disable generation of all packets. Some causes of operational errors may lead to packet bytes being dropped.

It should be noted that the timing of error detection may not be predictable. Errors are signaled when the processor encounters the problematic configuration. This could be as soon as packet generation is enabled but could also be later when the problematic entry or field needs to be used.

Once an error is signaled, software should disable packet generation by clearing TraceEn, diagnose and fix the error condition, and clear IA32\_RTIT\_STATUS.Error. At this point, packet generation can be re-enabled.

## 35.4 TRACE PACKETS AND DATA TYPES

This section details the data packets generated by Intel Processor Trace. It is useful for developers writing the interpretation code that will decode the data packets and apply it to the traced source code.

### 35.4.1 Packet Relationships and Ordering

This section introduces the concept of packet “binding”, which involves determining the IP in a binary disassembly at which the change indicated by a given packet applies. Some packets have the associated IP as the payload (FUP, TIP), while for others the decoder need only search for the next instance of a particular instruction (or instructions) to bind the packet (TNT). However, in many cases, the decoder will need to consider the relationship between packets, and to use this packet context to determine how to bind the packet.

Section 35.4.2 below provides detailed descriptions of the packets, including how packets bind to IPs in the disassembly, to other packets, or to nothing at all. Many packets listed are simple to bind, because they are generated in only a few scenarios. Those that require more consideration are typically part of “compound packet events”, such as interrupts, exceptions, and some instructions, where multiple packets are generated by a single operation (instruction or event). These compound packet events frequently begin with a FUP to indicate the source address (if it is not clear from the disassembly), and are concluded by a TIP or TIP.PGD packet that indicates the destination address (if one is provided). In this scenario, the FUP is said to be “coupled” with the TIP packet.

Other packets could be in between the coupled FUP and TIP packet. Timing packets, such as TSC, MTC, CYC, or CBR, could arrive at any time, and hence could intercede in a compound packet event. If an operation changes CR3 or the processor’s mode of execution, a state update packet (i.e., PIP or MODE) is generated. The state changes indicated by these intermediate packets should be applied at the IP of the TIP\* packet. A summary of compound packet events is provided in Table 35-15; see Section 35.4.2 for more per-packet details and Section 35.7 for more detailed packet generation examples.

Table 35-15. Compound Packet Event Summary

| Event Type  | Beginning                   | Middle   | End                   | Comment  |
|---|-----------------------------|--|-----------------------|--|
| Unconditional, uncompressed control-flow transfer | FUP or none                 | Any combination of PIP, VMCS, MODE.Exec, or none | TIP or TIP.PGD        | FUP only for asynchronous events. Order of middle packets may vary.<br>PIP/VMCS/MODE only if the operation modifies the state tracked by these respective packets. |
| TSX Update  | MODE.TSX, and (FUP or none) | None   | TIP, TIP.PGD, or none | FUP<br>TIP/TIP.PGD only for TSX abort cases.   |
| Overflow  | OVF                         | PSB, PSBEND, or none                             | FUP or TIP.PGE        | FUP if overflow resolves while ContextEn=1, else TIP.PGE.  |

35.4.2 Packet Definitions

The following description of packet definitions are in tabular format. Figure 35-3 explains how to interpret them. Packet bits listed as “RSVD” are not guaranteed to be 0.

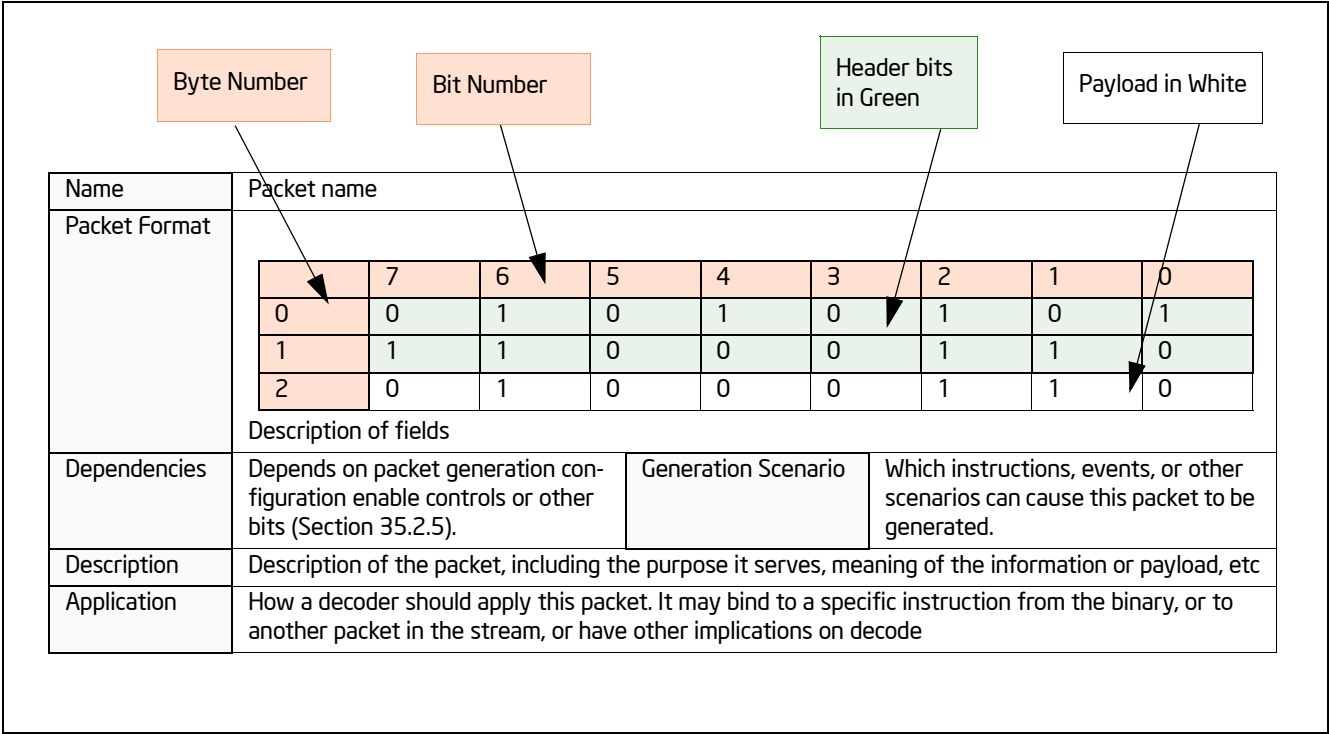

Figure 35-3. Interpreting Tabular Definition of Packet Format

35.4.2.1 Taken/Not-taken (TNT) Packet

Table 35-16. TNT Packet Definition

| Name          | Taken/Not-taken (TNT) Packet |   |                |                |                |                |                |                |   |           |
|---------------|------------------------------|---|----------------|----------------|----------------|----------------|----------------|----------------|---|-----------|
| Packet Format |                              |   |                |                |                |                |                |                |   |           |
|               |                              | 7 | 6              | 5              | 4              | 3              | 2              | 1              | 0 |           |
|               | 0                            | 1 | B <sub>1</sub> | B <sub>2</sub> | B <sub>3</sub> | B <sub>4</sub> | B <sub>5</sub> | B <sub>6</sub> | 0 | Short TNT |

Table 35-16. TNT Packet Definition (Contd.)

|              |   |                 |                     |   |                 |                 |                 |                 |           |  |  |   |   |   |   |   |   |   |   |  |   |   |   |   |                |                |                |                |   |           |   |   |   |   |   |   |   |   |   |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                |                |                 |                 |                 |                 |                 |                 |   |   |                |                |                |                |                |                |                |
|--------------|---|-----------------|---------------------|---|-----------------|-----------------|-----------------|-----------------|-----------|--|--|---|---|---|---|---|---|---|---|--|---|---|---|---|----------------|----------------|----------------|----------------|---|-----------|---|---|---|---|---|---|---|---|---|---|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|---|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|---|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|---|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|---|----------------|----------------|-----------------|-----------------|-----------------|-----------------|-----------------|-----------------|---|---|----------------|----------------|----------------|----------------|----------------|----------------|----------------|
|              | B1...BN represent the last N conditional branch or compressed RET (Section 35.4.2.2) results, such that B1 is oldest and BN is youngest. The short TNT packet can contain from 1 to 6 TNT bits. The long TNT packet can contain from 1 to 47 TNT bits.  |                 |                     |   |                 |                 |                 |                 |           |  |  |   |   |   |   |   |   |   |   |  |   |   |   |   |                |                |                |                |   |           |   |   |   |   |   |   |   |   |   |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                |                |                 |                 |                 |                 |                 |                 |   |   |                |                |                |                |                |                |                |

|              | <p>Irrespective of how many TNT bits is in a packet, the last valid TNT bit is followed by a trailing 1, or Stop bit, as shown above. If the TNT packet is not full (fewer than 6 TNT bits for the Short TNT, or fewer than 47 TNT bits for the Long TNT), the Stop bit moves up, and the trailing bits of the packet are filled with 0s. Examples of these “partial TNTs” are shown below.</p> <table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td><td></td></tr><tr><td>0</td><td>0</td><td>0</td><td>1</td><td>B<sub>1</sub></td><td>B<sub>2</sub></td><td>B<sub>3</sub></td><td>B<sub>4</sub></td><td>0</td><td>Short TNT</td></tr></table>   |                 |                     |   |                 |                 |                 |                 |           |  |  | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 |  | 0 | 0 | 0 | 1 | B <sub>1</sub> | B <sub>2</sub> | B <sub>3</sub> | B <sub>4</sub> | 0 | Short TNT |   |   |   |   |   |   |   |   |   |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                |                |                 |                 |                 |                 |                 |                 |   |   |                |                |                |                |                |                |                |

| Dependencies | PacketEn  |                 | Generation Scenario | On a conditional branch or compressed RET, if it fills the TNT. Also, partial TNTs may be generated at any time, as a result of other packets being generated, or certain micro-architectural conditions occurring, before the TNT is full. |                 |                 |                 |                 |           |  |  |   |   |   |   |   |   |   |   |  |   |   |   |   |                |                |                |                |   |           |   |   |   |   |   |   |   |   |   |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                |                |                 |                 |                 |                 |                 |                 |   |   |                |                |                |                |                |                |                |
| Description  | Provides the taken/not-taken results for the last 1–N conditional branches (Jcc, J*CXZ, or LOOP) or compressed RETs (Section 35.4.2.2). The TNT payload bits should be interpreted as follows: <ul style="list-style-type: none"><li>▪ 1 indicates a taken conditional branch, or a compressed RET</li><li>▪ 0 indicates a not-taken conditional branch</li></ul>   |                 |                     |   |                 |                 |                 |                 |           |  |  |   |   |   |   |   |   |   |   |  |   |   |   |   |                |                |                |                |   |           |   |   |   |   |   |   |   |   |   |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                |                |                 |                 |                 |                 |                 |                 |   |   |                |                |                |                |                |                |                |
| Application  | Each valid payload bit (that is, bits between the header bits and the trailing Stop bit) applies to an upcoming conditional branch or RET instruction. Once a decoder consumes a TNT packet with N valid payload bits, these bits should be applied to (and hence provide the destination for) the next N conditional branches or RETs  |                 |                     |   |                 |                 |                 |                 |           |  |  |   |   |   |   |   |   |   |   |  |   |   |   |   |                |                |                |                |   |           |   |   |   |   |   |   |   |   |   |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                 |                 |                 |                 |                 |                 |                 |                 |   |                |                |                 |                 |                 |                 |                 |                 |   |   |                |                |                |                |                |                |                |

35.4.2.2 Target IP (TIP) Packet

Table 35-17. IP Packet Definition

|               |   |                 |                     |   |   |   |   |   |   |
|---------------|---|-----------------|---------------------|---|---|---|---|---|---|
| Name          | Target IP (TIP) Packet  |                 |                     |   |   |   |   |   |   |
| Packet Format |   | 7               | 6                   | 5 | 4   | 3 | 2 | 1 | 0 |
|               | 0   | IPBytes         |                     |   | 0   | 1 | 1 | 0 | 1 |
|               | 1   | TargetIP[7:0]   |                     |   |   |   |   |   |   |
|               | 2   | TargetIP[15:8]  |                     |   |   |   |   |   |   |
|               | 3   | TargetIP[23:16] |                     |   |   |   |   |   |   |
|               | 4   | TargetIP[31:24] |                     |   |   |   |   |   |   |
|               | 5   | TargetIP[39:32] |                     |   |   |   |   |   |   |
|               | 6   | TargetIP[47:40] |                     |   |   |   |   |   |   |
|               | 7   | TargetIP[55:48] |                     |   |   |   |   |   |   |
|               | 8   | TargetIP[63:56] |                     |   |   |   |   |   |   |
| Dependencies  | PacketEn  |                 | Generation Scenario |   | Indirect branch (including un-compressed RET), far branch, interrupt, exception, INIT, SIPI, VM exit, VM entry, TSX abort, EENTER, EEXIT, ERESUME, AEX <sup>1</sup> . |   |   |   |   |
| Description   | Provides the target for some control flow transfers   |                 |                     |   |   |   |   |   |   |
| Application   | Anytime a TIP is encountered, it indicates that control was transferred to the IP provided in the payload.  |                 |                     |   |   |   |   |   |   |
|               | The source of this control flow change, and hence the IP or instruction to which it binds, depends on the packets that precede the TIP. If a TIP is encountered and all preceding packets have already been bound, then the TIP will apply to the upcoming indirect branch, far branch, or VMRESUME. However, if there was a preceding FUP that remains unbound, it will bind to the TIP. Here, the TIP provides the target of an asynchronous event or TSX abort that occurred at the IP given in the FUP payload. Note that there may be other packets, in addition to the FUP, which will bind to the TIP packet. See the packet application descriptions for other packets for details. |                 |                     |   |   |   |   |   |   |

NOTES:

1. EENTER, EEXIT, ERESUME, AEX would be possible only for a debug enclave.

IP Compression

The IP payload in a TIP, FUP, TIP.PGE, or TIP.PGD packet can vary in size, based on the mode of execution, and the use of IP compression. IP compression is an optional compression technique the processor may choose to employ to reduce bandwidth. With IP compression, the IP to be represented in the payload is compared with the last IP sent out, via any of FUP, TIP, TIP.PGE, or TIP.PGD. If that previous IP had the same upper (most significant) address bytes, those matching bytes may be suppressed in the current packet. The processor maintains an internal state of the “Last IP” that was encoded in trace packets, thus the decoder will need to keep track of the “Last IP” state in software, to match fidelity with packets generated by hardware. “Last IP” is initialized to zero, hence if the first IP in the trace may be compressed if the upper bytes are zeroes.

The “IPBytes” field of the IP packets (FUP, TIP, TIP.PGE, TIP.PGD) serves to indicate how many bytes of payload are provided, and how the decoder should fill in any suppressed bytes. The algorithm for reconstructing the IP for a TIP/FUP packet is shown in the table below.

**Table 35-18. FUP/TIP IP Reconstruction**

| IPBytes | Uncompressed IP Value      |       |                  |       |                  |       |                  |     |
|---------|----------------------------|-------|------------------|-------|------------------|-------|------------------|-----|
|         | 63:56                      | 55:48 | 47:40            | 39:32 | 31:24            | 23:16 | 15:8             | 7:0 |
| 000b    | None, IP is out of context |       |                  |       |                  |       |                  |     |
| 001b    | Last IP[63:16]             |       |                  |       |                  |       | IP Payload[15:0] |     |
| 010b    | Last IP[63:32]             |       |                  |       | IP Payload[31:0] |       |                  |     |
| 011b    | IP Payload[47] extended    |       | IP Payload[47:0] |       |                  |       |                  |     |
| 100b    | Last IP [63:48]            |       | IP Payload[47:0] |       |                  |       |                  |     |
| 101b    | Reserved                   |       |                  |       |                  |       |                  |     |
| 110b    | IP Payload[63:0]           |       |                  |       |                  |       |                  |     |
| 111b    | Reserved                   |       |                  |       |                  |       |                  |     |

The processor-internal Last IP state is guaranteed to be reset to zero when a PSB is sent out. This means that the IP that follows the PSB with either be un-compressed (011b or 110b, see Table 35-18), or compressed against zero.

At times, “IPbytes” will have a value of 0. As shown above, this does not mean that the IP payload matches the full address of the last IP, but rather that the IP for this packet was suppressed. This is used for cases where the IP that applies to the packet is out of context. An example is the TIP.PGD sent on a SYSCALL, when tracing only USR code. In that case, no TargetIP will be included in the packet, since that would expose an instruction point at CPL = 0. When the IP payload is suppressed in this manner, Last IP is not cleared, and instead refers to the last IP packet with a non-zero IPBytes field.

On processors that support a maximum linear address size of 32 bits, IP payloads may never exceed 32 bits (IPBytes <= 010b).

### Indirect Transfer Compression for Returns (RET)

In addition to IP compression, TIP packets for near return (RET) instructions can also be compressed. If the RET target matches the next IP of the corresponding CALL, then the TIP packet is unneeded, since the decoder can deduce the target IP by maintaining a CALL/RET stack of its own.

A CALL/RET stack can be maintained by the decoder by doing the following:

1. Allocate space to store 64 RET targets.
2. For near CALLs, push the Next IP onto the stack. Once the stack is full, new CALLs will force the oldest entry off the end of the stack, such that only the youngest 64 entries are stored. Note that this excludes zero-length CALLs, which are direct near CALLs with displacement zero (to the next IP). These CALLs typically don't have matching RETs.
3. For near RETs, pop the top (youngest) entry off the stack. This will be the target of the RET.

In cases where the RET is compressed, the target is guaranteed to match the value produced in 2) above. If the target is not compressed, a TIP packet will be generated with the RET target, which may differ from 2).

The hardware ensure that packets read by the decoder will always have seen the CALL that corresponds to any compressed RET. The processor will never compress a RET across a PSB, a buffer overflow, or scenario where PacketEn=0. This means that a RET whose corresponding CALL executed while PacketEn=0, or before the last PSB, etc., will not be compressed.

If the CALL/RET stack is manipulated or corrupted by software, and thereby causes a RET to transfer control to a target that is inconsistent with the CALL/RET stack, then the RET will not be compressed, and will produce a TIP packet. This can happen, for example, if software executes a PUSH instruction to push a target onto the stack, and a later RET uses this target.

When a RET is compressed, a Taken indication is added to the TNT buffer. Because it sends no TIP packet, it also does not update the internal Last IP value, and thus the decoder should treat it the same way. If the RET is not compressed, it will generate a TIP packet (just like when RET compression is disabled, via IA32\_RTIT\_CTL.DisRETC). For processors that employ deferred TIPs (Section 35.4.2.3), an uncompressed RET will not be deferred, and hence will force out any accumulated TNTs or TIPs. This serves to avoid ambiguity, and make

clear to the decoder whether the near RET was compressed, and hence a bit in the in-progress TNT should be consumed, or uncompressed, in which case there will be no in-progress TNT and thus a TIP should be consumed.

Note that in the unlikely case that a RET executes in a different execution mode than the associated CALL, the decoder will need to model the same behavior with its CALL stack. For instance, if a CALL executes in 64-bit mode, a 64-bit IP value will be pushed onto the software stack. If the corresponding RET executes in 32-bit mode, then only the lower 32 target bits will be popped off of the stack, which may mean that the RET does not go to the CALL's Next IP. This is architecturally correct behavior, and this RET could be compressed, thus the decoder should match this behavior

### 35.4.2.3 Deferred TIPs

The processor may opt to defer sending out the TNT when TIPs are generated. Thus, rather than sending a partial TNT followed by a TIP, both packets will be deferred while the TNT accumulates more Jcc/RET results. Any number of TIP packets may be accumulated this way, such that only once the TNT is filled, or once another packet (e.g., FUP) is generated, the TNT will be sent, followed by all the deferred TIP packets, and finally terminated by the other packet(s) that forced out the TNT and TIP packets. Generation of many other packets (see list below) will force out the TNT and any accumulated TIP packets. This is an optional optimization in hardware to reduce the bandwidth consumption, and hence the performance impact, incurred by tracing.

**Table 35-19. TNT Examples with Deferred TIPs**

| Code Flow  | Packets, Non-Deferred TIPS            | Packets, Deferred TIPS   |
|--|---------------------------------------|--|
| 0x1000 cmp %rcx, 0<br>0x1004 jnz Foo // not-taken<br>0x1008 jmp %rdx   | TNT(0b0), TIP(0x1308)                 |  |
| 0x1308 cmp %rcx, 1<br>0x130c jnz Bar // not-taken<br>0x1310 cmp %rcx, 2<br>0x1314 jnz Baz // taken<br>0x1500 cmp %eax, 7<br>0x1504 jg Exit // not-taken<br>0x1508 jmp %r15 | TNT(0b010), TIP(0x1100)               |  |
| 0x1100 cmp %rbx, 1<br>0x1104 jg Start // not-taken<br>0x1108 add %rcx, %eax<br>0x110c ... // <b>an asynchronous Interrupt arrives</b><br>INThandler:<br>0xcc00 pop %rdx    | TNT(0b0), FUP(0x110c),<br>TIP(0xcc00) | TNT(0b00100), TIP(0x1308),<br>TIP(0x1100), FUP(0x110c),<br>TIP(0xcc00) |

### 35.4.2.4 Packet Generation Enable (TIP.PGE)

**Table 35-20. TIP.PGE Packet Definition**

|               |  |                 |   |                     |  |   |   |   |   |
|---------------|--|-----------------|---|---------------------|--|---|---|---|---|
| Name          | Target IP - Packet Generation Enable (TIP.PGE)   |                 |   |                     |  |   |   |   |   |
| Packet Format |  | 7               | 6 | 5                   | 4  | 3 | 2 | 1 | 0 |
|               | 0  | IPBytes         |   |                     | 1  | 0 | 0 | 0 | 1 |
|               | 1  | TargetIP[7:0]   |   |                     |  |   |   |   |   |
|               | 2  | TargetIP[15:8]  |   |                     |  |   |   |   |   |
|               | 3  | TargetIP[23:16] |   |                     |  |   |   |   |   |
|               | 4  | TargetIP[31:24] |   |                     |  |   |   |   |   |
|               | 5  | TargetIP[39:32] |   |                     |  |   |   |   |   |
|               | 6  | TargetIP[47:40] |   |                     |  |   |   |   |   |
|               | 7  | TargetIP[55:48] |   |                     |  |   |   |   |   |
|               | 8  | TargetIP[63:56] |   |                     |  |   |   |   |   |
| Dependencies  | PacketEn transitions to 1  |                 |   | Generation Scenario | Any branch instruction, control flow transfer, or MOV CR3 that sets PacketEn, a WRMSR that enables packet generation and sets PacketEn |   |   |   |   |
| Description   | <p>Indicates that PacketEn has transitioned to 1. It provides the IP at which the tracing begins. This can occur due to any of the enables that comprise PacketEn transitioning from 0 to 1, as long as all the others are asserted. Examples:</p> <ul style="list-style-type: none"><li>▪ TriggerEn: This is set on software write to set IA32_RTIT_CTL.TraceEn as long as the Stopped and Error bits in IA32_RTIT_STATUS are clear. The IP payload will be the Next IP of the WRMSR.</li><li>▪ FilterEn: This is set when software jumps into the tracing region. This region is defined by enabling IP filtering in IA32_RTIT_CTL.ADDRn_CFG, and defining the range in IA32_RTIT_ADDRn_[AB], see. Section 35.2.4.3. The IP payload will be the target of the branch.</li><li>▪ ContextEn: This is set on a CPL change, a CR3 write or any other means of changing ContextEn. The IP payload will be the Next IP of the instruction that changes context if it is not a branch, otherwise it will be the target of the branch.</li></ul> |                 |   |                     |  |   |   |   |   |
| Application   | TIP.PGE packets bind to the instruction at the IP given in the payload.  |                 |   |                     |  |   |   |   |   |

### 35.4.2.5 Packet Generation Disable (TIP.PGD)

**Table 35-21. TIP.PGD Packet Definition**

|               |  |   |                     |   |   |   |   |   |  |  |  |   |   |   |   |   |   |   |   |   |         |  |  |   |   |   |   |   |   |               |  |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |

| 8             | TargetIP[63:56]  |   |                     |   |   |   |   |   |  |  |  |   |   |   |   |   |   |   |   |   |         |  |  |   |   |   |   |   |   |               |  |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |
| Dependencies  | PacketEn transitions to 0  |   | Generation Scenario |   | Any branch instruction, control flow transfer, or MOV CR3 that clears PacketEn, a WRMSR that disables packet generation and clears PacketEn |   |   |   |  |  |  |   |   |   |   |   |   |   |   |   |         |  |  |   |   |   |   |   |   |               |  |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |
| Description   | <p>Indicates that PacketEn has transitioned to 0. It will include the IP at which the tracing ends, unless ContextEn= 0 or TraceEn=0 at the conclusion of the instruction or event that cleared PacketEn.</p> <p>PacketEn can be cleared due to any of the enables that comprise PacketEn transitioning from 1 to 0. Examples:</p> <ul style="list-style-type: none"><li>▪ TriggerEn: This is cleared on software write to clear IA32_RTIT_CTL.TraceEn, or when IA32_RTIT_STATUS.Stopped is set, or on operational error. The IP payload will be suppressed in this case, and the “IPBytes” field will have the value 0.</li><li>▪ FilterEn: This is set when software jumps out of the tracing region. This region is defined by enabling IP filtering in IA32_RTIT_CTL.ADDRn_CFG, and defining the range in IA32_RTIT_ADDRn_[AB], see. Section 35.2.4.3. The IP payload will depend on the type of the branch. For conditional branches, the payload is suppressed (IPBytes = 0), and in this case the destination can be inferred from the disassembly. For any other type of branch, the IP payload will be the target of the branch.</li><li>▪ ContextEn: This can happen on a CPL change, a CR3 write or any other means of changing ContextEn. See Section 35.2.4.3 for details. In this case, when ContextEn is cleared, there will be no IP payload. The “IPBytes” field will have value 0.</li></ul> <p>Note that, in cases where a branch that would normally produce a TIP packet (i.e., far transfer, indirect branch, interrupt, etc) or TNT update (conditional branch or compressed RT) causes PacketEn to transition from 1 to 0, the TIP or TNI bit will be replaced with TIP.PGD. The payload of the TIP.PGD will be the target of the branch, unless the result of the instruction causes TraceEn or ContextEn to be cleared (ie, SYSCALL when IA32_RTIT_CTL.OS=0, In the case where a conditional branch clears FilterEn and hence PacketEn, there will be no TNT bit for this branch, replaced instead by the TIP.PGD.</p> |   |                     |   |   |   |   |   |  |  |  |   |   |   |   |   |   |   |   |   |         |  |  |   |   |   |   |   |   |               |  |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |
| Application   | <p>TIP.PGD can be produced by any branch instructions, as well as some non-branch instructions, that clear PacketEn. When produced by a branch, it replaces any TIP or TNT update that the branch would normally produce.</p> <p>In cases where there is an unbound FUP preceding the TIP.PGD, then the TIP.PGD is part of compound operation (i.e., asynchronous event or TSX abort) which cleared PacketEn. For most such cases, the TIP.PGD is simply replacing a TIP, and should be treated the same way. The TIP.PGD may or may not have an IP payload, depending on whether the operation cleared ContextEn.</p> <p>If there is not an associated FUP, the binding will depend on whether there is an IP payload. If there is an IP payload, then the TIP.PGD should be applied to either the next direct branch whose target matches the TIP.PGD payload, or the next branch that would normally generate a TIP or TNT packet. If there is no IP payload, then the TIP.PGD should apply to the next branch or MOV CR3 instruction.</p>  |   |                     |   |   |   |   |   |  |  |  |   |   |   |   |   |   |   |   |   |         |  |  |   |   |   |   |   |   |               |  |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |   |                 |  |  |  |  |  |  |  |  |

| Dependencies  | TriggerEn & ContextEn.<br>(Typically depends on BranchEn and FilterEn as well, see Section 35.2.4 for details.)  | Generation Scenario | Asynchronous Events (interrupts, exceptions, INIT, SIPI, SMI, VM exit, #MC), XBEGIN, XEND, XABORT, XACQUIRE, XRELEASE, EENTER, EEXIT, ERESUME, EEE, AEX, <sup>1</sup> , INT 0, INT 3, INT n, a WRMSR that disables packet generation. |   |   |   |   |   |   |   |   |   |   |         |  |  |   |   |   |   |   |   |         |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |
| Description   | Provides the source address for asynchronous events, and some other instructions. Is never sent alone, always sent with an associated TIP or MODE packet, and potentially others.  |                     |   |   |   |   |   |   |   |   |   |   |   |         |  |  |   |   |   |   |   |   |         |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |
| Application   | FUP packets provide the IP to which they bind. However, they are never standalone, but are coupled with other packets.<br>In TSX cases, the FUP is immediately preceded by a MODE.TSX, which binds to the same IP. A TIP will follow only in the case of TSX aborts, see Section 35.4.2.8 for details.<br>Otherwise, FUPs are part of compound packet events (see Section 35.4.1). In these compound cases, the FUP provides the source IP for an instruction or event, while a following TIP (or TIP.PGD) uop will provide any destination IP. Other packets may be included in the compound event between the FUP and TIP. |                     |   |   |   |   |   |   |   |   |   |   |   |         |  |  |   |   |   |   |   |   |         |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |

NOTES:

1. EENTER, EEXIT, ERESUME, EEE, AEX apply only if Intel Software Guard Extensions is supported.

## FUP IP Payload

Flow Update Packet gives the source address of an instruction when it is needed. In general, branch instructions do not need a FUP, because the source address is clear from the disassembly. For asynchronous events, however, the source address cannot be inferred from the source, and hence a FUP will be sent. Table 35-23 illustrates cases where FUPs are sent, and which IP can be expected in those cases.

**Table 35-23. FUP Cases and IP Payload**

| Event  | Flow Update IP   | Comment  |
|--|--|--|
| External Interrupt, NMI/SMI, Traps, Machine Check (trap-like), INIT/SIPI | Address of next instruction (Next IP) that would have been executed    | Functionally, this matches the LBR FROM field value and also the EIP value which is saved onto the stack.  |
| Exceptions/Faults, Machine check (fault-like)                            | Address of the instruction which took the exception/fault (Current IP) | This matches the similar functionality of LBR FROM field value and also the EIP value which is saved onto the stack.   |
| Software Interrupt   | Address of the software interrupt instruction (Current IP)             | This matches the similar functionality of LBR FROM field value, but does not match the EIP value which is saved onto the stack (Next Linear Instruction Pointer - NLIP). |
| EENTER, EEXIT, ERESUME, Enclave Exiting Event (EEE), AEX <sup>1</sup>    | Current IP of the instruction  | This matches the LBR FROM field value and also the EIP value which is saved onto the stack.  |
| XACQUIRE   | Address of the X* instruction  |  |
| XRELEASE, XBEGIN, XEND, XABORT, other transactional abort                | Current IP   |  |
| #SMI   | IP that is saved into SMRAM  |  |
| WRMSR that clears TraceEn  | Current IP   |  |

### NOTES:

1. Information on EENTER, EEXIT, ERESUME, EEE, Asynchronous Enclave eXit (AEX) can be found in *Intel® Software Guard Extensions Programming Reference*.

On a canonical fault due to sequentially fetching an instruction in non-canonical space (as opposed to jumping to non-canonical space), the IP of the fault (and thus the payload of the FUP) will be a non-canonical address. This is consistent with what is pushed on the stack for such faulting cases.

If there are post-commit task switch faults, the IP value of the FUP will be the original IP when the task switch started. This is the same value as would be seen in the LBR\_FROM field. But it is a different value as is saved on the stack or VMCS.

### 35.4.2.7 Paging Information (PIP) Packet

**Table 35-24. PIP Packet Definition**

| 5             | CR3[35:28]  |   |   |                     |   |   |   |         |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                |  |  |  |  |  |  |         |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |
| 6             | CR3[43:36]  |   |   |                     |   |   |   |         |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                |  |  |  |  |  |  |         |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |
| 7             | CR3[51:44]  |   |   |                     |   |   |   |         |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                |  |  |  |  |  |  |         |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |
| Dependencies  | TriggerEn && ContextEn && IA32_RTIT_CTL.OS  |   |   | Generation Scenario | MOV CR3, Task switch, INIT, SIPI, PSB+, VM exit, VM entry |   |   |         |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                |  |  |  |  |  |  |         |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |
| Description   | <p>The CR3 payload shown includes only the address portion of the CR3 value. For PAE paging, CR3[11:5] are thus included. For other page modes (32-bit and 4-level paging<sup>1</sup>), these bits are 0.</p> <p>This packet holds the CR3 address value. It will be generated on operations that modify CR3:</p> <ul style="list-style-type: none"><li>▪ MOV CR3 operation</li><li>▪ Task Switch</li><li>▪ INIT and SIPI</li><li>▪ VM exit, if “conceal VMX from PT” VM-exit control is 0 (see Section 35.5.1)</li><li>▪ VM entry, if “conceal VMX from PT” VM-entry control is 0</li></ul> <p>PIPs are not generated, despite changes to CR3, on SMI and RSM. This is due to the special behavior on these operations, see Section 35.2.8.3 for details. Note that, for some cases of task switch where CR3 is not modified, no PIP will be produced.</p> <p>The purpose of the PIP is to indicate to the decoder which application is running, so that it can apply the proper binaries to the linear addresses that are being traced.</p> <p>The PIP packet contains the new CR3 value when CR3 is written.</p> <p>PIPs generated by VM entries set the NR bit. PIPs generated in VMX non-root operation set the NR bit if the “conceal VMX from PT” VM-execution control is 0 (see Section 35.5.1). All other PIPs clear the NR bit.</p> |   |   |                     |   |   |   |         |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                |  |  |  |  |  |  |         |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |
| Application   | <p>The purpose of the PIP packet is to help the decoder uniquely identify what software is running at any given time. When a PIP is encountered, a decoder should do the following:</p> <p>1) If there was a prior unbound FUP (that is, a FUP not preceded by a packet such as MODE.TSX that consumes it, and it hence pairs with a TIP that has not yet been seen), then this PIP is part of a compound packet event (Section 35.4.1). Find the ending TIP and apply the new CR3/NR values to the TIP payload IP.</p> <p>2) Otherwise, look for the next MOV CR3, far branch, or VMRESUME/VMLAUNCH in the disassembly, and apply the new CR3 to the next (or target) IP.</p> <p>For examples of the packets generated by these flows, see Section 35.7.</p>   |   |   |                     |   |   |   |         |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                |  |  |  |  |  |  |         |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |   |            |  |  |  |  |  |  |  |

#### NOTES:

1. Earlier versions of this manual used the term “IA-32e paging” to identify 4-level paging.

35.4.2.8 MODE Packets

MODE packets keep the decoder informed of various processor modes about which it needs to know in order to properly manage the packet output, or to properly disassemble the associated binaries. MODE packets include a header and a mode byte, as shown below.

Table 35-25. General Form of MODE Packets

|   |         |   |   |      |   |   |   |   |
|---|---------|---|---|------|---|---|---|---|
|   | 7       | 6 | 5 | 4    | 3 | 2 | 1 | 0 |
| 0 | 1       | 0 | 0 | 1    | 1 | 0 | 0 | 1 |
| 1 | Leaf ID |   |   | Mode |   |   |   |   |

The MODE Leaf ID indicates which set of mode bits are held in the lower bits.

MODE.Exec Packet

Table 35-26. MODE.Exec Packet Definition

| Dependencies  | PacketEn   | Generation Scenario | Far branch, interrupt, exception, VM exit, and VM entry, if the mode changes. PSB+, and any scenario that can generate a TIP.PGE, such that the mode may have changed since the last MODE.Exec. |   |   |   |      |              |      |                        |                 |   |   |     |   |   |             |   |   |             |   |   |             |   |   |   |   |   |   |   |   |   |   |      |              |
| Description   | <p>Indicates whether software is in 16, 32, or 64-bit mode, by providing the CS.D and (CS.L &amp; IA32_EFER.LMA) values. Essential for the decoder to properly disassemble the associated binary.</p> <table><tr><td>CS.D</td><td>(CS.L &amp; IA32_EFER.LMA)</td><td>Addressing Mode</td></tr><tr><td>1</td><td>1</td><td>N/A</td></tr><tr><td>0</td><td>1</td><td>64-bit mode</td></tr><tr><td>1</td><td>0</td><td>32-bit mode</td></tr><tr><td>0</td><td>0</td><td>16-bit mode</td></tr></table> <p>MODE.Exec is sent at the time of a mode change, if PacketEn=1 at the time, or when tracing resumes, if necessary. In the former case, the MODE.Exec packet is generated along with other packets that result from the far transfer operation that changes the mode. In cases where the mode changes while PacketEn=0, the processor will send out a MODE.Exec along with the TIP.PGE when tracing resumes. The processor may opt to suppress the MODE.Exec when tracing resumes if the mode matches that from the last MODE.Exec packet, if there was no PSB in between.</p> |                     |   |   |   |   |      |              | CS.D | (CS.L & IA32_EFER.LMA) | Addressing Mode | 1 | 1 | N/A | 0 | 1 | 64-bit mode | 1 | 0 | 32-bit mode | 0 | 0 | 16-bit mode |   |   |   |   |   |   |   |   |   |   |      |              |
| CS.D          | (CS.L & IA32_EFER.LMA)   | Addressing Mode     |   |   |   |   |      |              |      |                        |                 |   |   |     |   |   |             |   |   |             |   |   |             |   |   |   |   |   |   |   |   |   |   |      |              |
| 1             | 1  | N/A                 |   |   |   |   |      |              |      |                        |                 |   |   |     |   |   |             |   |   |             |   |   |             |   |   |   |   |   |   |   |   |   |   |      |              |
| 0             | 1  | 64-bit mode         |   |   |   |   |      |              |      |                        |                 |   |   |     |   |   |             |   |   |             |   |   |             |   |   |   |   |   |   |   |   |   |   |      |              |
| 1             | 0  | 32-bit mode         |   |   |   |   |      |              |      |                        |                 |   |   |     |   |   |             |   |   |             |   |   |             |   |   |   |   |   |   |   |   |   |   |      |              |
| 0             | 0  | 16-bit mode         |   |   |   |   |      |              |      |                        |                 |   |   |     |   |   |             |   |   |             |   |   |             |   |   |   |   |   |   |   |   |   |   |      |              |
| Application   | MODE.Exec always immediately precedes a TIP or TIP.PGE. The mode change applies to the IP address in the payload of the next TIP or TIP.PGE.   |                     |   |   |   |   |      |              |      |                        |                 |   |   |     |   |   |             |   |   |             |   |   |             |   |   |   |   |   |   |   |   |   |   |      |              |

## MODE.TSX Packet

Table 35-27. MODE.TSX Packet Definition

|               |  |      |   |                     |   |   |   |         |      |
|---------------|--|------|---|---------------------|---|---|---|---------|------|
| Name          | MODE.TSX Packet  |      |   |                     |   |   |   |         |      |
| Packet Format |  |      |   |                     |   |   |   |         |      |
|               |  | 7    | 6   | 5                   | 4 | 3   | 2 | 1       | 0    |
|               | 0  | 1    | 0   | 0                   | 1 | 1   | 0 | 0       | 1    |
|               | 1  | 0    | 0   | 1                   | 0 | 0   | 0 | TXAbort | InTX |
| Dependencies  | TriggerEn and ContextEn  |      |   | Generation Scenario |   | XBEGIN, XEND, XABORT, XACQUIRE, XRELEASE, if INTX changes, Asynchronous TSX Abort, PSB+ |   |         |      |
| Description   | Indicates when a TSX transaction (either HLE or RTM) begins, commits, or aborts. Instructions executed transactionally will be “rolled back” if the transaction is aborted.  |      |   |                     |   |   |   |         |      |
|               |  |      |   |                     |   |   |   |         |      |
|               | TXAbort  | InTX | Implication   |                     |   |   |   |         |      |
|               | 1  | 1    | N/A   |                     |   |   |   |         |      |
|               | 0  | 1    | Transaction begins, or executing transactionally        |                     |   |   |   |         |      |
|               | 1  | 0    | Transaction aborted                                     |                     |   |   |   |         |      |
|               | 0  | 0    | Transaction committed, or not executing transactionally |                     |   |   |   |         |      |
| Application   | If PacketEn=1, MODE.TSX always immediately precedes a FUP. If the TXAbort bit is zero, then the mode change applies to the IP address in the payload of the FUP. If TXAbort=1, then the FUP will be followed by a TIP, and the mode change will apply to the IP address in the payload of the TIP.<br>MODE.TSX packets may be generated when PacketEn=0, due to FilterEn=0. In this case, only the last MODE.TSX generated before TIP.PGE need be applied. |      |   |                     |   |   |   |         |      |

### 35.4.2.9 TraceStop Packet

**Table 35-28. TraceStop Packet Definition**

|               |   |   |                     |   |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|---------------|---|---|---------------------|---|---|---|---|---|--|--|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Name          | TraceStop Packet  |   |                     |   |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Packet Format | <table><tr><td></td><td>7</td><td>6</td><td>5</td><td>4</td><td>3</td><td>2</td><td>1</td><td>0</td></tr><tr><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>0</td></tr><tr><td>1</td><td>1</td><td>0</td><td>0</td><td>0</td><td>0</td><td>0</td><td>1</td><td>1</td></tr></table>   |   |                     |   |   |   |   |   |  |  | 7 | 6 | 5 | 4 | 3 | 2 | 1 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 | 1 | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 1 |
|               | 7   | 6 | 5                   | 4   | 3 | 2 | 1 | 0 |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 0             | 0   | 0 | 0                   | 0   | 0 | 0 | 1 | 0 |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 1             | 1   | 0 | 0                   | 0   | 0 | 0 | 1 | 1 |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Dependencies  | TriggerEn && ContextEn  |   | Generation Scenario | Taken branch with target in TraceStop IP region, MOV CR3 in TraceStop IP region, or WRMSR that sets TraceEn in TraceStop IP region. |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Description   | <p>Indicates when software has entered a user-configured TraceStop region.</p> <p>When the IP matches a TraceStop range while ContextEn and TriggerEn are set, a TraceStop action occurs. This disables tracing by setting IA32_RTIT_STATUS.Stopped, thereby clearing TriggerEn, and causes a TraceStop packet to be generated.</p> <p>The TraceStop action also forces FilterEn to 0. Note that TraceStop may not force a flush of internally buffered packets, and thus trace packet generation should still be manually disabled by clearing IA32_RTIT_CTL.TraceEn before examining output. See Section 35.2.4.3 for more details.</p> |   |                     |   |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Application   | <p>If TraceStop follows a TIP.PGD (before the next TIP.PGE), then it was triggered either by the instruction that cleared PacketEn, or it was triggered by some later instruction that executed while FilterEn=0. In either case, the TraceStop can be applied at the IP of the TIP.PGD (if any).</p> <p>If TraceStop follows a TIP.PGE (before the next TIP.PGD), it should be applied at the last known IP.</p>   |   |                     |   |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

### 35.4.2.10 Core:Bus Ratio (CBR) Packet

**Table 35-29. CBR Packet Definition**

|               |   |                |   |                     |   |   |   |   |   |
|---------------|---|----------------|---|---------------------|---|---|---|---|---|
| Name          | Core:Bus Ratio (CBR) Packet   |                |   |                     |   |   |   |   |   |
| Packet Format |   |                |   |                     |   |   |   |   |   |
|               |   | 7              | 6 | 5                   | 4 | 3   | 2 | 1 | 0 |
|               | 0   | 0              | 0 | 0                   | 0 | 0   | 0 | 1 | 0 |
|               | 1   | 0              | 0 | 0                   | 0 | 0   | 0 | 1 | 1 |
|               | 2   | Core:Bus Ratio |   |                     |   |   |   |   |   |
|               | 3   | Reserved       |   |                     |   |   |   |   |   |
| Dependencies  | TriggerEn   |                |   | Generation Scenario |   | After any frequency change, on C-state wake up, PSB+, and after enabling trace packet generation. |   |   |   |
| Description   | Indicates the core:bus ratio of the processor core. Useful for correlating wall-clock time and cycle time.  |                |   |                     |   |   |   |   |   |
| Application   | All packets following the CBR represent instructions that executed with the new core:bus ratio, while all preceding packets (aside from timing packets) represent instructions that executed with the prior ratio. There is not a precise IP provided, to which to bind the CBR packet. |                |   |                     |   |   |   |   |   |

### 35.4.2.11 Timestamp Counter (TSC) Packet

**Table 35-30. TSC Packet Definition**

|               |  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |

| 3             | SW TSC[23:16]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |
| 4             | SW TSC[31:24]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |
| 5             | SW TSC[39:32]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |
| 6             | SW TSC[47:40]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |
| 7             | SW TSC[55:48]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |
| Dependencies  | IA32_RTIT_CTL.TSCEn && TriggerEn   | Generation Scenario | Sent after any event that causes the processor clocks or Intel PT timing packets (such as MTC or CYC) to stop, This may include P-state changes, wake from C-state, or clock modulation. Also on transition of TraceEn from 0 to 1. |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |
| Description   | When enabled by software, a TSC packet provides the lower 7 bytes of the current TSC value, as returned by the RDTSC instruction. This may be useful for tracking wall-clock time, and synchronizing the packets in the log with other timestamped logs.   |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |
| Application   | TSC packet provides a wall-clock proxy of the event which generated it (packet generation enable, sleep state wake, etc). In all cases, TSC does not precisely indicate the time of any control flow packets; however, all preceding packets represent instructions that executed before the indicated TSC time, and all subsequent packets represent instructions that executed after it. There is not a precise IP to which to bind the TSC packet.  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |             |  |  |  |  |  |  |  |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |

| Dependencies  | IA32_RTIT_CTL.MTCEn && TriggerEn   |   | Generation Scenario | Periodic, based on the core crystal clock, or Always Running Timer (ART). |   |   |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |            |  |  |  |  |  |  |  |
| Description   | <p>When enabled by software, an MTC packet provides a periodic indication of wall-clock time. The 8-bit CTC (Common Timestamp Copy) payload value is set to <math>(ART \gg N) \&amp; FFH</math>. The frequency of the ART is related to the Maximum Non-Turbo frequency, and the ratio can be determined from CPUID leaf 15H, as described in Section 35.8.3. Software can select the threshold N, which determines the MTC frequency by setting the IA32_RTIT_CTL.MTCFreq field (see Section 35.2.7.2) to a supported value using the lookup enumerated by CPUID (see Section 35.3.1). See Section 35.8.3 for details on how to use the MTC payload to track TSC time.</p> <p>MTC provides 8 bits from the ART, starting with the bit selected by MTCFreq to dictate the frequency of the packet. Whenever that 8-bit range being watched changes, an MTC packet will be sent out with the new value of that 8-bit range. This allows the decoder to keep track of how much wall-clock time has elapsed since the last TSC packet was sent, by keeping track of how many MTC packets were sent and what their value was. The decoder can infer the truncated bits, CTC[N-1:0], are 0 at the time of the MTC packet.</p> <p>There are cases in which MTC packet can be dropped, due to overflow or other micro-architectural conditions. The decoder should be able to recover from such cases by checking the 8-bit payload of the next MTC packet, to determine how many MTC packets were dropped. It is not expected that &gt;256 consecutive MTC packets should ever be dropped.</p> |   |                     |   |   |   |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |            |  |  |  |  |  |  |  |
| Application   | MTC does not precisely indicate the time of any other packet, nor does it bind to any IP. However, all preceding packets represent instructions or events that executed before the indicated ART time, and all subsequent packets represent instructions that executed after, or at the same time as, the ART time.  |   |                     |   |   |   |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |            |  |  |  |  |  |  |  |

| Dependencies  | IA32_RTIT_CTL.MTCEn &&<br>IA32_RTIT_CTL.TSCEn && TriggerEn   |   |   | Generation Scenario |   | Sent with any TSC packet. |   |       |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |          |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |   |   |                  |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |       |
| Description   | The TMA packet serves to provide the information needed to allow the decoder to correlate MTC packets with TSC packets. With this packet, when a MTC packet is encountered, the decoder can determine how many timestamp counter ticks have passed since the last TSC or MTC packet. See Section 35.8.3.2 for details on how to make this calculation.   |   |   |                     |   |                           |   |       |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |          |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |   |   |                  |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |       |
| Application   | TMA is always sent immediately following a TSC packet, and the payload values are consistent with the TSC payload value. Thus the application of TMA matches that of TSC.  |   |   |                     |   |                           |   |       |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |          |  |  |  |  |  |  |  |   |           |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |   |   |                  |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |       |

| ...           | ... (if Exp = 1 in the previous byte)  |                     |  |   |   |     |   |     |   |   |   |   |   |                    |  |  |  |  |     |   |   |   |                     |  |  |  |  |  |  |     |   |                      |  |  |  |  |  |  |     |     |                                       |  |  |  |  |  |  |  |
| Dependencies  | IA32_RTIT_CTL.CYCEn && TriggerEn   | Generation Scenario | Can be sent at any time, though a maximum of one CYC packet is sent per core clock cycle. See Section 35.3.6 for CYC-eligible packets. |   |   |     |   |     |   |   |   |   |   |                    |  |  |  |  |     |   |   |   |                     |  |  |  |  |  |  |     |   |                      |  |  |  |  |  |  |     |     |                                       |  |  |  |  |  |  |  |
| Description   | <p>The Cycle Counter field increments at the same rate as the processor core clock ticks, but with a variable length format (using a trailing EXP bit field) and a range-capped byte length.</p> <p>If the CYC value is less than 32, a 1-byte CYC will be generated, with Exp=0. If the CYC value is between 32 and 4095 inclusive, a 2-byte CYC will be generated, with byte 0 Exp=1 and byte 1 Exp=0. And so on.</p> <p>CYC provides the number of core clocks that have passed since the last CYC packet. CYC can be configured to be sent in every cycle in which an eligible packet is generated, or software can opt to use a threshold to limit the number of CYC packets, at the expense of some precision. These settings are configured using the IA32_RTIT_CTL.CycThresh field (see Section 35.2.7.2). For details on Cycle-Accurate Mode, IPC calculation, etc, see Section 35.3.6.</p> <p>When CycThresh=0, and hence no threshold is in use, then a CYC packet will be generated in any cycle in which any CYC-eligible packet is generated. The CYC packet will precede the other packets generated in the cycle, and provides the precise cycle time of the packets that follow.</p> <p>In addition to these CYC packets generated with other packets, CYC packets can be sent stand-alone. These packets serve simply to update the decoder with the number of cycles passed, and are used to ensure that a wrap of the processor's internal cycle counter doesn't cause cycle information to be lost. These stand-alone CYC packets do not indicate the cycle time of any other packet or operation, and will be followed by another CYC packet before any other CYC-eligible packet is seen.</p> <p>When CycThresh&gt;0, CYC packets are generated only after a minimum number of cycles have passed since the last CYC packet. Once this threshold has passed, the behavior above resumes, where CYC will either be sent in the next cycle that produces other CYC-eligible packets, or could be sent stand-alone.</p> <p>When using CYC thresholds, only the cycle time of the operation (instruction or event) that generates the CYC packet is truly known. Other operations simply have their execution time bounded: they completed at or after the last CYC time, and before the next CYC time.</p> |                     |  |   |   |     |   |     |   |   |   |   |   |                    |  |  |  |  |     |   |   |   |                     |  |  |  |  |  |  |     |   |                      |  |  |  |  |  |  |     |     |                                       |  |  |  |  |  |  |  |
| Application   | <p>CYC provides the offset cycle time (since the last CYC packet) for the CYC-eligible packet that follows. If another CYC is encountered before the next CYC-eligible packet, the cycle values should be accumulated and applied to the next CYC-eligible packet.</p> <p>If a CYC packet is generated by a TNT, note that the cycle time provided by the CYC packet applies to the first branch in the TNT packet.</p>  |                     |  |   |   |     |   |     |   |   |   |   |   |                    |  |  |  |  |     |   |   |   |                     |  |  |  |  |  |  |     |   |                      |  |  |  |  |  |  |     |     |                                       |  |  |  |  |  |  |  |

| 2             | VMCS pointer [19:12]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |
| 3             | VMCS pointer [27:20]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |
| 4             | VMCS pointer [35:28]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |
| 5             | VMCS pointer [43:36]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |
| 6             | VMCS pointer [51:44]  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |
| Dependencies  | TriggerEn && ContextEn;<br>Also in VMX operation.   | Generation Scenario | Generated on successful VMPTRLD, and optionally on SMM VM exits and VM entries that return from SMM (see Section 35.5). |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |
| Description   | <p>The VMCS packet provides a VMCS pointer for a decoder to determine the transition of code contexts:</p> <ul style="list-style-type: none"><li>On a successful VMPTRLD (i.e., a VMPTRLD that doesn't fault, fail, or VM exit), the VMCS packet contains the logical processor's VMCS pointer established by VMPTRLD (for subsequent execution of a VM guest context).</li><li>An SMM VM exit loads the logical processor's VMCS pointer with the SMM-transfer VMCS pointer. If the "conceal VMX from PT" VM-exit control is 0 (see Section 35.5.1), a VMCS packet provides this pointer. See Section 35.6 on tracing inside and outside STM.</li><li>A VM entry that returns from SMM loads the logical processor's VMCS pointer from a field in the SMM-transfer VMCS. If the "conceal VMX from PT" VM-entry control is 0, a VMCS packet provides this pointer. Whether the VM entry is to VMX root operation or VMX non-root operation is indicated by the PIP.NR bit.</li></ul> <p>A VMCS packet generated before a VMCS pointer has been loaded, or after the VMCS pointer has been cleared will set all 64 bits in the VMCS pointer field.</p> <p>VMCS packets will not be seen on processors with IA32_VMX_MISC[bit 14]=0, as these processors do not allow TraceEn to be set in VMX operation.</p> |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |
| Application   | <p>The purpose of the VMCS packet is to help the decoder uniquely identify changes in the executing software context in situations that CR3 may not be unique.</p> <p>When a VMCS packet is encountered, a decoder should do the following:</p> <ul style="list-style-type: none"><li>If there was a prior unbound FUP (that is, a FUP not preceded by a packet such as MODE.TSX that consumes it, and it hence pairs with a TIP that has not yet been seen), then this VMCS is part of a compound packet event (Section 35.4.1). Find the ending TIP and apply the new VMCS base pointer value to the TIP payload IP.</li><li>Otherwise, look for the next VMPTRLD, VMRESUME, or VMLAUNCH in the disassembly, and apply the new VMCS base pointer on the next VM entry.</li></ul> <p>For examples of the packets generated by these flows, see Section 35.7.</p>   |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |   |                      |  |  |  |  |  |  |  |

### 35.4.2.16 Overflow (OVF) Packet

| 0             | 0  | 0 | 0                   | 0 | 0   | 0 | 1 | 0 |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| 1             | 1  | 1 | 1                   | 1 | 0   | 0 | 1 | 1 |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Dependencies  | TriggerEn  |   | Generation Scenario |   | On resolution of internal buffer overflow |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Description   | OVF simply indicates to the decoder that an internal buffer overflow occurred, and packets were likely lost. If BranchEN= 1, OVF is followed by a FUP or TIP.PGE which will provide the IP at which packet generation resumes. See Section 35.3.8.   |   |                     |   |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| Application   | When an OVF packet is encountered, the decoder should skip to the IP given in the subsequent FUP or TIP.PGE. The cycle counter for the CYC packet will be reset at the time the OVF packet is sent. Software should reset its call stack depth on overflow, since no RET compression is allowed across an overflow. Similarly, any IP compression that follows the OVF is guaranteed to use as a reference LastIP the IP payload of an IP packet that preceded the overflow. |   |                     |   |   |   |   |   |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |

### 35.4.2.17 Packet Stream Boundary (PSB) Packet

**Table 35-36. PSB Packet Definition**

|               |                                     |   |   |   |   |   |   |   |   |

|               | 10                                  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
|               | 11                                  | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
|               | 12                                  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
|               | 13                                  | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
|               | 14                                  | 0 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |
|               | 15                                  | 1 | 0 | 0 | 0 | 0 | 0 | 1 | 0 |

**Table 35-36. PSB Packet Definition (Contd.)**

|              |  |                     |  |
|--------------|--|---------------------|--|
| Dependencies | TriggerEn  | Generation Scenario | Periodic, based on the number of output bytes generated while tracing. PSB is sent when IA32_RTIT_STATUS.PacketByteCnt=0, and each time it crosses the software selected threshold after that. May be sent for other micro-architectural conditions as well. |
| Description  | <p>PSB is a unique pattern in the packet output log, and hence serves as a sync point for the decoder. It is a pattern that the decoder can search for in order to get aligned on packet boundaries. This packet is periodic, based on the number of output bytes, as indicated by IA32_RTIT_STATUS.PacketByteCnt. The period is chosen by software, via IA32_RTIT_CTL.PSBFreq (see Section 35.2.7.2). Note, however, that the PSB period is not precise, it simply reflects the average number of output bytes that should pass between PSBs. The processor will make a best effort to insert PSB as quickly after the selected threshold is reached as possible. The processor also may send extra PSB packets for some micro-architectural conditions.</p> <p>PSB also serves as the leading packet for a set of “status-only” packets collectively known as PSB+ (Section 35.3.7).</p> |                     |  |
| Application  | When a PSB is seen, the decoder should interpret all following packets as “status only”, until either a PSBEND or OVF packet is encountered. “Status only” implies that the binding and ordering rules to which these packets normally adhere are ignored, and the state they carry can instead be applied to the IP payload in the FUP packet that is included.   |                     |  |

### 35.4.2.18 PSBEND Packet

**Table 35-37. PSBEND Packet Definition**

|               |  |   |   |                     |   |  |   |   |   |
|---------------|--|---|---|---------------------|---|--|---|---|---|
| Name          | PSBEND Packet  |   |   |                     |   |  |   |   |   |
| Packet Format |  |   |   |                     |   |  |   |   |   |
|               |  | 7 | 6 | 5                   | 4 | 3  | 2 | 1 | 0 |
|               | 0  | 0 | 0 | 0                   | 0 | 0  | 0 | 1 | 0 |
|               | 1  | 0 | 0 | 1                   | 0 | 0  | 0 | 1 | 1 |
| Dependencies  | TriggerEn  |   |   | Generation Scenario |   | Always follows PSB packet, separated by PSB+ packets |   |   |   |
| Description   | PSBEND is simply a terminator for the series of “status only” (PSB+) packets that follow PSB (Section 35.3.7). |   |   |                     |   |  |   |   |   |
| Application   | When a PSBEND packet is seen, the decoder should cease to treat packets as “status only”.                      |   |   |                     |   |  |   |   |   |

### 35.4.2.19 Maintenance (MNT) Packet

**Table 35-38. MNT Packet Definition**

|               |  |                |                     |   |                          |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |    |                |  |  |  |  |  |  |  |

| Dependencies  | TriggerEn  |                | Generation Scenario |   | Implementation specific. |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |    |                |  |  |  |  |  |  |  |
| Description   | This packet is generated by hardware, the payload meaning is model-specific.   |                |                     |   |                          |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |    |                |  |  |  |  |  |  |  |
| Application   | Unless a decoder has been extended for a particular family/model/stepping to interpret MNT packet payloads, this packet should simply be ignored. It does not bind to any IP.  |                |                     |   |                          |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |              |  |  |  |  |  |  |  |   |               |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |   |                |  |  |  |  |  |  |  |    |                |  |  |  |  |  |  |  |

| Dependencies  | TriggerEn   |   |   | Generation Scenario |   | Implementation specific |   |   |   |
| Description   | PAD is simply a NOP packet. Processor implementations may choose to add pad packets to improve packet alignment or for implementation-specific reasons. |   |   |                     |   |                         |   |   |   |
| Application   | Ignore PAD packets.   |   |   |                     |   |                         |   |   |   |

| 0             | 0  | 0                   | 0   | 0 | 0 | 0 | 1 | 0 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |   |   |   |   |   |   |   |
| 1             | IP   | 1                   | 1   | 0 | 0 | 0 | 1 | 0 |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |   |   |   |   |   |   |   |
| Dependencies  | TriggerEn & PwrEvtEn   | Generation Scenario | C-state entry, P-state change, or other processor clock power-down. Includes : <ul style="list-style-type: none"><li>▪ Entry to C-state deeper than C0.0</li><li>▪ TM1/2</li><li>▪ STPCLK#</li><li>▪ Frequency change due to IA32_CLOCK_MODULATION, Turbo</li></ul> |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |   |   |   |   |   |   |   |
| Description   | <p>This packet indicates that software execution has stopped due to processor clock powerdown. Later packets will indicate when execution resumes.</p> <p>If EXSTOP is generated while ContextEn is set, the IP bit will be set, and EXSTOP will be followed by a FUP packet containing the IP at which execution stopped. More precisely, this will be the IP of the oldest instruction that has not yet completed.</p> <p>This packet is CYC-eligible, and hence will generate a CYC packet if IA32_RTIT_CTL.CYCEn=1 and any CYC Threshold has been reached.</p> |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |   |   |   |   |   |   |   |
| Application   | <p>If a FUP follows EXSTOP (hence IP bit set), the EXSTOP can be bound to the FUP IP. Otherwise the IP is not known. Time of powerdown can be inferred from the preceding CYC, if CYCEn=1. Combined with the TSC at the time of wake (if TSCEn=1), this can be used to determine the duration of the powerdown.</p>  |                     |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |   |   |   |   |   |   |   |

## 35.4.2.23 MWAIT Packet

| Dependencies  | TriggerEn & PwrEvtEn & ContextEn   |   |   | Generation Scenario |   | MWAIT instruction, or I/O redirection to MWAIT, that complete without fault or VMexit. |          |   |  |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                  |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |          |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |
| Description   | Indicates that an MWAIT operation to C-state deeper than C0.0 completed. The MWAIT hints and extensions passed in by software are exposed in the payload.<br>This packet is CYC-eligible, and hence will generate a CYC packet if IA32_RTIT_CTL.CYCEn=1 and any CYC Threshold has been reached.  |   |   |                     |   |  |          |   |  |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                  |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |          |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |
| Application   | The MWAIT packet should bind to the IP of the next FUP, which will be the IP of the instruction that caused the MWAIT. This FUP will be shared with EXSTOP.  |   |   |                     |   |  |          |   |  |  |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                  |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |          |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |

| Dependencies  | TriggerEn & PwrEvtEn  |          | Generation Scenario |   | Transition to a C-state deeper than C0.0. |   |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |          |  |  |  |  |  |  |   |                         |  |  |  |                             |  |  |  |
| Description   | <p>Indicates processor entry to the resolved thread C-state and sub C-state indicated. The processor will remain in this C-state until either another PWRE indicates the processor has moved to a C-state deeper than C0.0, or a PWRX packet indicates a return to C0.</p> <p>Note that some CPUs may allow MWAIT to request a deeper C-state than is supported by the core. These deeper C-states may have platform-level implications that differentiate them. However, the PWRE packet will provide only the resolved thread C-state, which will not exceed that supported by the core.</p> <p>If the C-state entry was initiated by hardware, rather than a direct software request (such as MWAIT, HLT, or shut-down), the HW bit will be set to indicate this. Hardware Duty Cycling (see Section 14.5, “Hardware Duty Cycling (HDC)” in the <i>Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 3B</i>) is an example of such a case.</p> |          |                     |   |   |   |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |          |  |  |  |  |  |  |   |                         |  |  |  |                             |  |  |  |
| Application   | When transitioning from C0.0 to a deeper C-state, the PWRE packet will be followed by an EXSTOP. If that EXSTOP packet has the IP bit set, then the following FUP will provide the IP at which the C-state entry occurred. Subsequent PWRE packets generated before the next PWRX should bind to the same IP.   |          |                     |   |   |   |   |   |  |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |    |          |  |  |  |  |  |  |   |                         |  |  |  |                             |  |  |  |

### 35.4.2.25 Power Exit (PWRX) Packet

| Description   | <p>Indicates processor return to thread C0 from a C-state deeper than C0.0.</p> <p>The Last Core C-State field provides the MWAIT encoding for the core C-state at the time of the wake. The Deepest Core C-State provides the MWAIT encoding for the deepest core C-state achieved during the sleep session, or since leaving thread C0. MWAIT encodings for C-states can be found in Table 4-11 in the <i>Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 2B</i>. Note that these values reflect only the core C-state, and hence will not exceed the maximum supported core C-state, even if deeper C-states can be requested.</p> <p>The Wake Reason field is one-hot, encoded as follows:</p> <table><tr><th>Bit</th><th>Field</th><th>Meaning</th></tr><tr><td>0</td><td>Interrupt</td><td>Wake due to external interrupt received.</td></tr><tr><td>1</td><td>Reserved</td><td></td></tr><tr><td>2</td><td>Store to Monitored Address</td><td>Wake due to store to monitored address.</td></tr><tr><td>3</td><td>HW Wake</td><td>Wake due to hardware autonomous condition, such as HDC.</td></tr></table> |   |                     |   |                      |   |   |   | Bit | Field | Meaning | 0 | Interrupt | Wake due to external interrupt received. | 1 | Reserved |   | 2 | Store to Monitored Address | Wake due to store to monitored address. | 3 | HW Wake | Wake due to hardware autonomous condition, such as HDC. |   |   |   |   |   |   |   |   |   |   |   |   |   |                   |  |  |  |                      |  |  |  |   |          |  |  |  |             |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |

| 2             | Store to Monitored Address  | Wake due to store to monitored address.                 |                     |   |                      |   |   |   |     |       |         |   |           |  |   |          |   |   |                            |   |   |         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                   |  |  |  |                      |  |  |  |   |          |  |  |  |             |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |
| 3             | HW Wake   | Wake due to hardware autonomous condition, such as HDC. |                     |   |                      |   |   |   |     |       |         |   |           |  |   |          |   |   |                            |   |   |         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                   |  |  |  |                      |  |  |  |   |          |  |  |  |             |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |
| Application   | PWRX will always apply to the same IP as the PWRE. The time of wake can be discerned from (optional) timing packets that precede PWRX.  |   |                     |   |                      |   |   |   |     |       |         |   |           |  |   |          |   |   |                            |   |   |         |   |   |   |   |   |   |   |   |   |   |   |   |   |   |                   |  |  |  |                      |  |  |  |   |          |  |  |  |             |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |   |          |  |  |  |  |  |  |  |

## 35.5 TRACING IN VMX OPERATION

On processors that IA32\_VMX\_MISC[bit 14] reports 1, TraceEn can be set in VMX operation. A series of mechanisms exist to allow the VMM to configure tracing based on the desired trace domain, and on the consumer of the trace output. The VMM can configure specific VMX controls to control what virtualization-specific data are included within the trace packets (see Section 35.5.1 for details). The MSR-load areas used by VMX transitions can be employed by the VMM to restrict tracing to the desired context (see Section 35.5.2 for details). These configuration options are summarized in Table 35-45. Table 35-45 covers common Intel PT usages while SMIs are handled by the default SMM treatment. Tracing with SMM Transfer Monitor is described in Section 35.6.

Table 35-45. Common Usages of Intel PT and VMX

| Target Domain           | Output Consumer    | Virtualize Output                    | Configure VMX Controls           | TraceEN Configuration   | Save/Restore MSR states of Trace Configuration     |
|-------------------------|--------------------|--------------------------------------|----------------------------------|---|--|
| System-Wide (VMM + VMs) | Host               | N/A                                  | Default setting (no suppression) | WRMSR or XRSTORS by Host  | N/A  |
| VMM Only                | Intel PT Aware VMM | N/A                                  | Enable suppression               | Use VMX MSR-load areas to disable tracing in VM, enable tracing on VM exits | N/A  |
| VM Only                 | Intel PT Aware VMM | N/A                                  | Enable suppression               | Use VMX MSR-load areas to enable tracing in VM, disable tracing on VM exits | N/A  |
| Intel PT Aware Guest(s) | Per Guest          | VMM adds trace output virtualization | Enable suppression               | Use VMX MSR-load areas to enable tracing in VM, disable tracing on VM exits | VMM updates guest state on VM exits due to XRSTORS |

### 35.5.1 VMX-Specific Packets and VMCS Controls

In all of the usages of VMX and Intel PT, a decoder in the host or VMM context can identify the occurrences of VMX transitions with the aid of VMX-specific packets. There are two kinds of packets relevant to VMX:

- **VMCS packet.** The VMX transitions of individual VMs can be distinguished by a decoder using the VMCS-pointer field in a VMCS packet. A VMCS packet is sent on a successful execution of VMPTRLD, and its VMCS-pointer field stores the VMCS pointer loaded by that execution. See Section 35.4.2.15 for details.
- **The NR (non-root) bit in a PIP packet.** Normally, the NR bit is set in any PIP packet generated in VMX non-root operation. In addition, PIP packets are generated with each VM entry and VM exit. Thus a transition of the NR bit from 0 to 1 indicates the occurrence of a VM entry, and a transition of 1 to 0 indicates the occurrence of a VM exit.

There are VMX controls that a VMM can set to conceal some of this VMX-specific information (by suppressing its recording) and thereby prevent it from leaking across virtualization boundaries. There is one of these controls (each of which is called “conceal VMX from PT”) of each type of VMX control.

Table 35-46. VMX Controls For Intel Processor Trace

| Type of VMX Control                            | Bit Position <sup>1</sup> | Value | Behavior   |
|--|---------------------------|-------|--|
| Secondary processor-based VM-execution control | 19                        | 0     | Each PIP generated in VM non-root operation will set the NR bit.<br>PSB+ in VMX non-root operation will include the VMCS packet, to ensure that the decoder knows which guest is currently in use. |
|  |                           | 1     | Each PIP generated in VMX non-root operation will clear the NR bit.<br>PSB+ in VMX non-root operation will not include the VMCS packet.  |
| VM-exit control                                | 24                        | 0     | Each VM exit generates a PIP in which the NR bit is clear.<br>In addition, SMM VM exits generate VMCS packets.   |
|  |                           | 1     | VM exits do not generate PIPs, and no VMCS packets are generated on SMM VM exits.  |
| VM-entry control                               | 17                        | 0     | Each VM entry generates a PIP in which the NR bit is set (except VM entries that return from SMM to VMX root operation).<br>In addition, VM entries that return from SMM generate VMCS packets.    |
|  |                           | 1     | VM entries do not generate PIPs, and no VMCS packets are generated on VM entries that return from SMM.   |

#### NOTES:

1. These are the positions of the control bits in the relevant VMX control fields.

The 0-settings of these VMX controls enable all VMX-specific packet information. The scenarios that would use these default settings also do not require the VMM to use VMX MSR-load areas to enable and disable trace-packet generation across VMX transitions.

If IA32\_VMX\_MISC[bit 14] reports 0, the 1-settings of the VMX controls in Table 35-46 are not supported, and VM entry will fail on any attempt to set them.

## 35.5.2 Managing Trace Packet Generation Across VMX Transitions

In tracing scenarios that collect packets for both VMX root operation and VMX non-root operation, a host executive can manage the MSRs associated with trace packet generation directly. The states of these MSRs need not be modified using MSR load areas across VMX transitions.

For tracing scenarios that collect packets only within VMX root operation or only within VMX non-root operation, the VMM can use the MSR load areas to toggle IA32\_RTIT\_CTL.TraceEn.

### 35.5.2.1 System-Wide Tracing

When a host or VMM configures Intel PT to collect trace packets of the entire system, it can leave the relevant VMX controls clear to allow VMX-specific packets to provide information across VMX transitions. The VMX MSR-load areas need not be used to load Intel PT MSRs on VM exits or VM entries.

The decoder will desire to identify the occurrence of VMX transitions. The packets of interests to a decoder are shown in Table 35-47.

**Table 35-47. Packets on VMX Transitions (System-Wide Tracing)**

| Event    | Packets             | Description  |
|----------|---------------------|--|
| VM exit  | FUP(GuestIP)        | The FUP indicates at which point in the guest flow the VM exit occurred. This is important, since VM exit can be an asynchronous event. The IP will match that written into the VMCS.  |
|          | PIP(HostCR3, NR=0)  | The PIP packet provides the new host CR3 value, as well as indication that the logical processor is entering VMX root operation. This allows the decoder to identify the change of executing context from guest to host and load the appropriate set of binaries to continue decode.   |
|          | TIP(HostIP)         | The TIP indicates the destination IP, the IP of the first instruction to be executed in VMX root operation.<br>Note, this packet could be preceded by a MODE.Exec packet (Section 35.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition.   |
| VM entry | PIP(GuestCR3, NR=1) | The PIP packet provides the new guest CR3 value, as well as indication that the logical processor is entering VMX non-root operation. This allows the decoder to identify the change of executing context from host to guest and load the appropriate set of binaries to continue decode.  |
|          | TIP(GuestIP)        | The TIP indicates the destination IP, the IP of the first instruction to be executed in VMX non-root operation. This should match the RIP loaded from the VMCS.<br>Note, this packet could be preceded by a MODE.Exec packet (Section 35.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition. |

Since the VMX controls that suppress packet generation are cleared, a VMCS packet will be included in all PSB+ for this usage scenario. Additionally, VMPTRLD will generate such a packet. Thus the decoder can distinguish the execution context of different VMs.

When the host VMM configures a system to collect trace packets in this scenario, it should emulate CPUID to report CPUID.(EAX=07H, ECX=0):EBX[bit 26] as 0 to guests, indicating to guests that Intel PT is not available.

### VMX TSC Manipulation

The TSC packets generated while in VMX non-root operation will include any changes resulting from the use of a VMM's use of the TSC offsetting or TSC scaling VMX controls (see Chapter 25, "VMX Non-Root Operation"). In this system-wide usage model, the decoder may need to account for the effect of per-VM adjustments in the TSC

packets generated in VMX non-root operation and the absence of TSC adjustments in TSC packets generated in VMX root operation. The VMM can supply this information to the decoder.

### 35.5.2.2 Host-Only Tracing

When trace packets in VMX non-root operation are not desired, the VMM can use the VM-entry MSR-load area to load IA32\_RTIT\_CTL (clearing TraceEn) to disable trace-packet generation in guests, and use the VM-exit MSR-load area to load IA32\_RTIT\_CTL to set TraceEn.

When tracing only the host, the decoder does not need information about the guests, and the VMX controls for suppressing VMX-specific packets can be set to reduce the packets generated. VMCS packets will still be generated on execution of VMPTRLD and in PSB+ generated in the host, but these will be unused by the decoder.

The packets of interests to a decoder when trace packets are collected for host-only tracing are shown in Table 35-48.

**Table 35-48. Packets on VMX Transitions (Host-Only Tracing)**

| Event    | Packets         | Description  |
|----------|-----------------|--|
| VM exit  | TIP.PGE(HostIP) | The TIP.PGE indicates that trace packet generation is enabled and gives the IP of the first instruction to be executed in VMX root operation.<br>Note, this packet could be preceded by a MODE.Exec packet (Section 35.4.2.8). This is generated only in cases where CS.D or (CS.L & EFER.LMA) change during the transition. |
| VM entry | TIP.PGD()       | The TIP indicates that trace packet generation was disabled. This ensure that all buffered packets are flushed out.  |

### 35.5.2.3 Guest-Only Tracing

A VMM can configure trace-packet generation while in VMX non-root operation for guests executing normally. This is accomplished by utilizing the VMX MSR-load areas on VM exits and VM entries to limit trace-packet generation to the guest environment.

For this usage, the VM-entry MSR load area is programmed to enable trace packet generation; the VM-exit MSR load area is used to clear IA32\_RTIT\_CTL.TraceEn so as to disable trace-packet generation in the host. Further, if it is preferred that the guest packet stream contain no indication that execution was in VMX non-root operation, the VMM should set to 1 all the VMX controls enumerated in Table 35-46.

### 35.5.2.4 Virtualization of Guest Output Packet Streams

Each Intel PT aware guest OS can produce one or more output packet streams to destination addresses specified as guest physical address using by context-switching IA32\_RTIT\_OUTPUT\_BASE within the guest. The processor generates trace packets to the physical address specified in IA32\_RTIT\_OUTPUT\_BASE, and those specified in the ToPA tables. Thus, a VMM that supports Intel PT aware guest OS may wish to virtualize the output configurations of IA32\_RTIT\_OUTPUT\_BASE and ToPA for each trace configuration state of all the guests.

### 35.5.2.5 Emulation of Intel PT Traced State

If a VMM emulates an element of processor state by taking a VM exit on reads and/or writes to that piece of state, and the state element impacts Intel PT packet generation or values, it may be incumbent upon the VMM to insert or modify the output trace data.

If a VM exit is taken on a guest write to CR3 (including “MOV CR3” as well as task switches), the PIP packet normally generated on the CR3 write will be missing.

To avoid decoder confusion when the guest trace is decoded, the VMM should emulate the missing PIP by writing it into the guest output buffer. If the guest CR3 value is manipulated, the VMM may also need to manipulate the IA32\_RTIT\_CR3\_MATCH value, in order to ensure the trace behavior matches the guest's expectation.

Similarly, if a VMM emulates the TSC value by taking a VM exit on RDTSC, the TSC packets generated in the trace may mismatch the TSC values returned by the VMM on RDTSC. To ensure that the trace can be properly aligned

with software logs based on RDTSC, the VMM should either make corresponding modifications to the TSC packet values in the guest trace, or use mechanisms such as TSC offsetting or TSC scaling in place of exiting.

### 35.5.2.6 TSC Scaling

When TSC scaling is enabled for a guest using Intel PT, the VMM should ensure that the value of Maximum Non-Turbo Ratio[15:8] in MSR\_PLATFORM\_INFO (MSR 0CEH) and the TSC/"core crystal clock" ratio (EBX/EAX) in CPUID leaf 15H are set in a manner consistent with the resulting TSC rate that will be visible to the VM. This will allow the decoder to properly apply TSC packets, MTC packets (based on the core crystal clock or ART, whose frequency is indicated by CPUID leaf 15H), and CBR packets (which indicate the ratio of the processor frequency to the Max Non-Turbo frequency). Absent this, or separate indication of the scaling factor, the decoder will be unable to properly track time in the trace. See Section 35.8.3 for details on tracking time within an Intel PT trace.

### 35.5.2.7 Failed VM Entry

The packets generated by a failed VM entry depend both on the VMCS configuration, as well as on the type of failure. The results to expect are summarized in the table below. Note that packets in *italics* may or may not be generated, depending on implementation choice, and the point of failure.

**Table 35-49. Packets on a Failed VM Entry**

| Usage Model | Entry Configuration                          | Early Failure (fail through to next IP) | Late Failure (VM-exit like)  |
|-------------|--|---|--|
| System-Wide | No use of VM-entry MSR-load area             | TIP (NextIP)                            | PIP(Guest CR3, NR=1), TraceEn 0->1 Packets (See Section 35.2.7.3), PIP(HostCR3, NR=0), TIP(HostIP) |
| VMM Only    | VM-entry MSR-load area used to clear TraceEn | TIP (NextIP)                            | TraceEn 0->1 Packets (See Section 35.2.7.3), TIP(HostIP)   |
| VM Only     | VM-entry MSR-load area used to set TraceEn   | None                                    | None   |

### 35.5.2.8 VMX Abort

VMX abort conditions take the processor into a shutdown state. On a VM exit that leads to VMX abort, some packets (FUP, PIP) may be generated, but any expected TIP, TIP.PGE, or TIP.PGD may be dropped.

## 35.6 TRACING AND SMM TRANSFER MONITOR (STM)

The SMM-transfer monitor (STM) is a VMM that operates inside SMM while in VMX root operation. An STM operates in conjunction with an executive monitor. The latter operates outside SMM and in VMX root operation. Transitions from the executive monitor or its VMs to the STM are called SMM VM exits. The STM returns from SMM via a VM entry to the VM in VMX non-root operation or the executive monitor in VMX root operation.

Intel PT supports tracing in an STM similar to tracing support for VMX operation as described above in Section 35.5. As a result, on a SMM VM exit resulting from #SMI, TraceEn is not saved and then cleared. Software can save the state of the trace configuration MSRs and clear TraceEn using the MSR load/save lists.

## 35.7 PACKET GENERATION SCENARIOS

Table 35-50 and Table 35-52 illustrate the packets generated in various scenarios. In the heading row, PacketEn is abbreviated as PktEn, ContextEn as CntxEn. Note that this assumes that TraceEn=1 in IA32\_RTIT\_CTL, while TriggerEn=1 and Error=0 in IA32\_RTIT\_STATUS, unless otherwise specified. Entries that do not matter in packet generation are marked "D.C." Packets followed by a "?" imply that these packets depend on additional factors, which are listed in the "Other Dependencies" column.

In Table 35-50, PktEn is evaluated based on TiggerEn & ContextEn & FilterEn & BranchEn.

**Table 35-50. Packet Generation under Different Enable Conditions**

| Case | Operation  | PktEn Before | PktEn After | CntxEn After | Other Dependencies   | Packets Output  |
|------|--|--------------|-------------|--------------|--|---|
| 1a   | Normal non-jump operation  | 0            | 0           | D.C.         |  | None  |
| 1b   | Normal non-jump operation  | 1            | 1           | 1            |  | None  |
| 2a   | WRMSR/XRSTORS/RSM that changes TraceEn 0 -> 1, with PacketByteCnt >0 | 0            | 0           | D.C.         | *TSC if TSCEn=1;<br>*TMA if TSCEn=MTCEn=1  | TSC?, TMA?, CBR   |
| 2b   | WRMSR/XRSTORS/RSM that changes TraceEn 0 -> 1, with PacketByteCnt =0 | 0            | 0           | D.C.         | *TSC if TSCEn=1;<br>*TMA if TSCEn=MTCEn=1  | PSB, PSBEND (see Section 35.4.2.17)   |
| 2d   | WRMSR/XRSTORS/RSM that changes TraceEn 0 -> 1, with PacketByteCnt >0 | 0            | 1           | 1            | TSC if TSCEn=1;<br>TMA if TSCEn=MTCEn=1  | TSC?, TMA?, CBR, MODE.Exec, TIP.PGE(NLIP)   |
| 2e   | WRMSR/XRSTORS/RSM that changes TraceEn 0 -> 1, with PacketByteCnt =0 | 0            | 1           | 1            |  | MODE.Exec, TIP.PGE(NLIP), PSB, PSBEND (see Section 35.4.2.8, 35.4.2.7, 35.4.2.13, 35.4.2.15, 35.4.2.17) |
| 3a   | WRMSR that changes TraceEn 1 -> 0                                    | 0            | 0           | D.C.         |  | None  |
| 3b   | WRMSR that changes TraceEn 1 -> 0                                    | 1            | 0           | D.C.         |  | FUP(CLIP), TIP.PGD()  |
| 5a   | MOV to CR3   | 0            | 0           | 0            |  | None  |
| 5f   | MOV to CR3   | 0            | 0           | 1            | TraceStop if executed in a TraceStop region  | PIP(NewCR3,NR?), TraceStop?   |
| 5b   | MOV to CR3   | 0            | 1           | 1            | *PIP.NR=1 if not in root operation and the "conceal VMX from PT" VM-execution control is 0<br>*MODE.Exec if the mode has changed since the last MODE.Exec, or if no MODE.Exec since last PSB | PIP(NewCR3, NR?), MODE.Exec?, TIP.PGE(NLIP)   |
| 5c   | MOV to CR3   | 1            | 0           | 0            |  | TIP.PGD()   |
| 5e   | MOV to CR3   | 1            | 0           | 1            | *PIP.NR=1 if not in root operation and the "conceal VMX from PT" VM-execution control is 0<br>*TraceStop if executed in a TraceStop region   | PIP(NewCR3, NR?), TIP.PGE(NLIP), TraceStop?   |
| 5d   | MOV to CR3   | 1            | 1           | 1            | *PIP.NR=1 if not in root operation and the "conceal VMX from PT" VM-execution control is 0   | PIP(NewCR3, NR?)  |
| 6a   | Unconditional direct near jump                                       | 0            | 0           | D.C.         |  | None  |
| 6b   | Unconditional direct near jump                                       | 1            | 0           | 1            | TraceStop if BLIP is in a TraceStop region   | TIP.PGD(BLIP), TraceStop?   |
| 6c   | Unconditional direct near jump                                       | 0            | 1           | 1            | MODE.Exec if the mode has changed since the last MODE.Exec, or if no MODE.Exec since last PSB  | MODE.Exec?, TIP.PGE(BLIP)   |

**Table 35-50. Packet Generation under Different Enable Conditions (Contd.)**

| Case | Operation  | PktEn Before | PktEn After | CntxEn After | Other Dependencies   | Packets Output                               |
|------|--|--------------|-------------|--------------|--|--|
| 6d   | Unconditional direct near jump   | 1            | 1           | 1            |  | None   |
| 7a   | Conditional taken jump or compressed RET that does not fill up the internal TNT buffer | 0            | 0           | D.C.         |  | None   |
| 7b   | Conditional taken jump or compressed RET   | 0            | 1           | 1            | MODE.Exec if the mode has changed since the last MODE.Exec, or if no MODE.Exec since last PSB  | MODE.Exec?, TIP.PGE(BLIP)                    |
| 7e   | Conditional taken jump or compressed RET, with empty TNT buffer                        | 1            | 0           | 1            | TraceStop if BLIP is in a TraceStop region   | TIP.PGD(), TraceStop?                        |
| 7f   | Conditional taken jump or compressed RET, with non-empty TNT buffer                    | 1            | 0           | 1            | TraceStop if BLIP is in a TraceStop region   | TNT, TIP.PGD(), TraceStop?                   |
| 7d   | Conditional taken jump or compressed RET that fills up the internal TNT buffer         | 1            | 1           | 1            |  | TNT  |
| 8a   | Conditional non-taken jump   | 0            | 0           | D.C.         |  | None   |
| 8d   | Conditional not-taken jump that fills up the internal TNT buffer                       | 1            | 1           | 1            |  | TNT  |
| 9a   | Near indirect jump (JMP, CALL, or uncompressed RET)                                    | 0            | 0           | D.C.         |  | None   |
| 9b   | Near indirect jump (JMP, CALL, or uncompressed RET)                                    | 0            | 1           | 1            | MODE.Exec if the mode has changed since the last MODE.Exec, or if no MODE.Exec since last PSB  | MODE.Exec?, TIP.PGE(BLIP)                    |
| 9c   | Near indirect jump (JMP, CALL, or uncompressed RET)                                    | 1            | 0           | 1            | TraceStop if BLIP is in a TraceStop region   | TIP.PGD(BLIP), TraceStop?                    |
| 9d   | Near indirect jump (JMP, CALL, or uncompressed RET)                                    | 1            | 1           | 1            |  | TIP(BLIP)                                    |

## 35.8 SOFTWARE CONSIDERATIONS

### 35.8.1 Tracing SMM Code

Nothing prevents an SMM handler from configuring and enabling packet generation for its own use. As described in Section , SMI will always clear TraceEn, so the SMM handler would have to set TraceEn in order to enable tracing. There are some unique aspects and guidelines involved with tracing SMM code, which follows:

1. SMM should save away the existing values of any configuration MSRs that SMM intends to modify for tracing. This will allow the non-SMM tracing context to be restored before RSM.
2. It is recommended that SMM wait until it sets CSbase to 0 before enabling packet generation, to avoid possible LIP vs RIP confusion.
3. Packet output cannot be directed to SMRR memory, even while tracing in SMM.
4. Before performing RSM, SMM should take care to restore modified configuration MSRs to the values they had immediately after #SMI. This involves first disabling packet generation by clearing TraceEn, then restoring any other configuration MSRs that were modified.
5. RSM
  - Software must ensure that TraceEn=0 at the time of RSM. Tracing RSM is not a supported usage model, and the packets generated by RSM are undefined.
  - For processors on which Intel PT and LBR use are mutually exclusive (see Section 35.3.1.2), any RSM during which TraceEn is restored to 1 will suspend any LBR or BTS logging.

### 35.8.2 Cooperative Transition of Multiple Trace Collection Agents

A third-party trace-collection tool should take into consideration the fact that it may be deployed on a processor that supports Intel PT but may run under any operating system.

In such a deployment scenario, Intel recommends that tool agents follow similar principles of cooperative transition of single-use hardware resources, similar to how performance monitoring tools handle performance monitoring hardware:

- Respect the “in-use” ownership of an agent who already configured the trace configuration MSRs, see architectural MSRs with the prefix “IA32\_RTIT\_” in Chapter 2, “Model-Specific Registers (MSRs)” in the *Intel® 64 and IA-32 Architectures Software Developer’s Manual, Volume 4*, where “in-use” can be determined by reading the “enable bits” in the configuration MSRs.

- Relinquish ownership of the trace configuration MSRs by clearing the “enabled bits” of those configuration MSRs.

### 35.8.3 Tracking Time

This section describes the relationships of several clock counters whose update frequencies reside in different domains that feed into the timing packets. To track time, the decoder also needs to know the regularity or irregularity of the occurrences of various timing packets that store those clock counters.

Intel PT provides time information for three different but related domains:

- Processor timestamp counter

This counter increments at the max non-turbo or P1 frequency, and its value is returned on a RDTSC. Its frequency is fixed. The TSC packet holds the lower 7 bytes of the timestamp counter value. The TSC packet occurs occasionally and are much less frequent than the frequency of the time stamp counter. The timestamp counter will continue to increment when the processor is in deep C-States, with the exception of processors reporting CPUID.80000007H:EDX.InvariantTSC[bit 8] =0.

- Core crystal clock

The ratio of the core crystal clock to timestamp counter frequency is known as P, and can be calculated as CPUID.15H:EBX[31:0] / CPUID.15H:EAX[31:0]. The frequency of the core crystal clock is fixed and lower than that of the timestamp counter. The periodic MTC packet is generated based on software-selected multiples of the crystal clock frequency. The MTC packet is expected to occur more frequently than the TSC packet.

- Processor core clock

The processor core clock frequency can vary due to P-state and thermal conditions. The CYC packet provides elapsed time as measured in processor core clock cycles relative to the last CYC packet.

A decoder can use all or some combination of these packets to track time at different resolutions throughout the trace packets.

#### 35.8.3.1 Time Domain Relationships

The three domains are related by the following formula:

$$\text{TimeStampValue} = (\text{CoreCrystalClockValue} * P) + \text{AdjustedProcessorCycles} + \text{Software\_Offset};$$

The CoreCrystalClockValue can provide the coarse-grained component of the TSC value. P, or the TSC/“core crystal clock” ratio, can be derived from CPUID leaf 15H, as described in Section 35.8.3.

The AdjustedProcessorCycles component provides the fine-grained distance from the rising edge of the last core crystal clock. Specifically, it is a cycle count in the same frequency as the timestamp counter from the last crystal clock rising edge. The value is adjusted based on the ratio of the processor core clock frequency to the Maximum Non-Turbo (or P1) frequency.

The Software\_Offsets component includes software offsets that are factored into the timestamp value, such as IA32\_TSC\_ADJUST.

#### 35.8.3.2 Estimating TSC within Intel PT

For many usages, it may be useful to have an estimated timestamp value for all points in the trace. The formula provided in Section 35.8.3.1 above provides the framework for how such an estimate can be calculated from the various timing packets present in the trace.

The TSC packet provides the precise timestamp value at the time it is generated; however, TSC packets are infrequent, and estimates of the current timestamp value based purely on TSC packets are likely to be very inaccurate for this reason. In order to get more precise timing information between TSC packets, CYC packets and/or MTC packets should be enabled.

MTC packets provide incremental updates of the CoreCrystalClockValue. On processors that support CPUID leaf 15H, the frequency of the timestamp counter and the core crystal clock is fixed, thus MTC packets provide a means to update the running timestamp estimate. Between two MTC packets A and B, the number of crystal clock cycles passed is calculated from the 8-bit payloads of respective MTC packets:

$(CTC_B - CTC_A)$ , where  $CTC_i = MTC_i[15:8] \ll IA32\_RTIT\_CTL.MTCFreq$  and  $i = A, B$ .

The time from a TSC packet to the subsequent MTC packet can be calculated using the TMA packet that follows the TSC packet. The TMA packet provides both the crystal clock value (lower 16 bits, in the CTC field) and the AdjustedProcessorCycles value (in the FastCounter field) that can be used in the calculation of the corresponding core crystal clock value of the TSC packet.

When the next MTC after a pair of TSC/TMA is seen, the number of crystal clocks passed since the TSC packet can be calculated by subtracting the TMA.CTC value from the time indicated by the  $MTC_{Next}$  packet by

$CTC_{Delta}[15:0] = (CTC_{Next}[15:0] - TMA.CTC[15:0])$ , where  $CTC_{Next} = MTC_{Payload} \ll IA32\_RTIT\_CTL.MTCFreq$ .

The TMA.FastCounter field provides the fractional component of the TSC packet into the next crystal clock cycle.

CYC packets can provide further precision of an estimated timestamp value to many non-timing packets, by providing an indication of the time passed between other timing packets (MTCs or TSCs).

When enabled, CYC packets are sent preceding each CYC-eligible packet, and provide the number of processor core clock cycles that have passed since the last CYC packet. Thus between MTCs and TSCs, the accumulated CYC values can be used to estimate the adjusted\_processor\_cycles component of the timestamp value. The accumulated CPU cycles will have to be adjusted to account for the difference in frequency between the processor core clock and the P1 frequency. The necessary adjustment can be estimated using the core:bus ratio value given in the CBR packet, by multiplying the accumulated cycle count value by  $P1/CBR_{payload}$ .

Note that stand-alone TSC packets (that is, TSC packets that are not a part of a PSB+) are typically generated only when generation of other timing packets (MTCs and CYCs) has ceased for a period of time. Example scenarios include when Intel PT is re-enabled, or on wake after a sleep state. Thus any calculation of ART or cycle time leading up to a TSC packet will likely result in a discrepancy, which the TSC packet serves to correct.

A greater level of precision may be achieved by calculating the CPU clock frequency, see Section 35.8.3.4 below for a method to do so using Intel PT packets.

CYCs can be used to estimate time between TSCs even without MTCs, though this will likely result in a reduction in estimated TSC precision.

### 35.8.3.3 VMX TSC Manipulation

When software executes in non-Root operation, additional offset and scaling factors may be applied to the TSC value. These are optional, but may be enabled via VMCS controls on a per-VM basis. See Chapter 25, "VMX Non-Root Operation" for details on VMX TSC offsetting and TSC scaling.

Like the value returned by RDTSC, TSC packets will include these adjustments, but other timing packets (such as MTC, CYC, and CBR) are not impacted. In order to use the algorithm above to estimate the TSC value when TSC scaling is in use, it will be necessary for software to account for the scaling factor. See Section 35.5.2.6 for details.

### 35.8.3.4 Calculating Frequency with Intel PT

Because Intel PT can provide both wall-clock time and processor clock cycle time, it can be used to measure the processor core clock frequency. Either TSC or MTC packets can be used to track the wall-clock time. By using CYC packets to count the number of processor core cycles that pass in between a pair of wall-clock time packets, the ratio between processor core clock frequency and TSC frequency can be derived. If the P1 frequency is known, it can be applied to determine the CPU frequency. See Section 35.8.3.1 above for details on the relationship between TSC, MTC, and CYC.

## 23. Updates to Chapter 36, Volume 3D

Change bars show changes to Chapter 36 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

-----  
Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

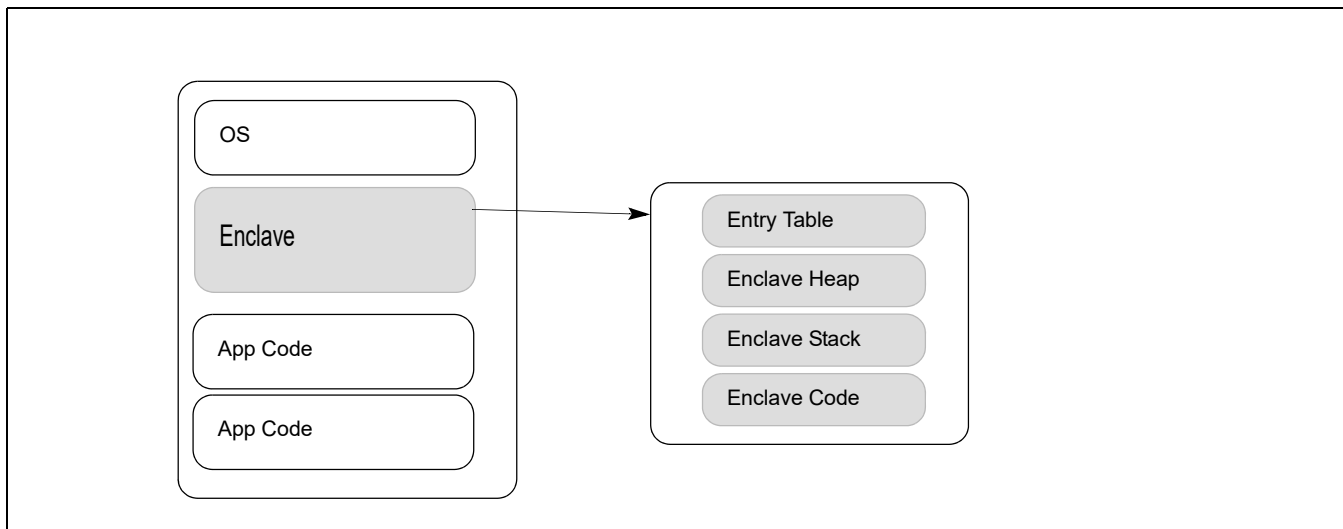

## CHAPTER 36

# INTRODUCTION TO INTEL® SOFTWARE GUARD EXTENSIONS

### 36.1 OVERVIEW

Intel® Software Guard Extensions (Intel® SGX) is a set of instructions and mechanisms for memory accesses added to Intel® Architecture processors. Intel SGX can encompass two collections of instruction extensions, referred to as SGX1 and SGX2, see Table 36-1 and Table 36-2. The SGX1 extensions allow an application to instantiate a protected container, referred to as an enclave. An enclave is a protected area in the application's address space (see Figure 36-1), which provides confidentiality and integrity even in the presence of privileged malware. Accesses to the enclave memory area from any software not resident in the enclave are prevented. The SGX2 extensions allow additional flexibility in runtime management of enclave resources and thread execution within an enclave.

Chapter 37 covers main concepts, objects and data structure formats that interact within the Intel SGX architecture. Chapter 38 covers operational aspects ranging from preparing an enclave, transferring control to enclave code, and programming considerations for the enclave code and system software providing support for enclave execution. Chapter 39 describes the behavior of Asynchronous Enclave Exit (AEX) caused by events while executing enclave code. Chapter 40 covers the syntax and operational details of the instruction and associated leaf functions available in Intel SGX. Chapter 41 describes interaction of various aspects of IA32 and Intel® 64 architectures with Intel SGX. Chapter 42 covers Intel SGX support for application debug, profiling and performance monitoring.

**Figure 36-1. An Enclave Within the Application's Virtual Address Space**

### 36.2 ENCLAVE INTERACTION AND PROTECTION

Intel SGX allows the protected portion of an application to be distributed in the clear. Before the enclave is built, the enclave code and data are free for inspection and analysis. The protected portion is loaded into an enclave where its code and data is measured. Once the application's protected portion of the code and data are loaded into an enclave, it is protected against external software access. An enclave can prove its identity to a remote party and provide the necessary building-blocks for secure provisioning of keys and credentials. The application can also request an enclave-specific and platform-specific key that it can use to protect keys and data that it wishes to store outside the enclave.<sup>1</sup>

1. For additional information, see white papers on Intel SGX at <http://software.intel.com/en-us/intel-isa-extensions>.

Intel SGX introduces two significant capabilities to the Intel Architecture. First is the change in enclave memory access semantics. The second is protection of the address mappings of the application.

### 36.3 ENCLAVE LIFE CYCLE

Enclave memory management is divided into two parts: address space allocation and memory commitment. Address space allocation is the specification of the range of logical addresses that the enclave may use. This range is called the ELRANGE. No actual resources are committed to this region. Memory commitment is the assignment of actual memory resources (as pages) within the allocated address space. This two-phase technique allows flexibility for enclaves to control their memory usage and to adjust dynamically without overusing memory resources when enclave needs are low. Commitment adds physical pages to the enclave. An operating system may support separate allocate and commit operations.

During enclave creation, code and data for an enclave are loaded from a clear-text source, i.e. from non-enclave memory.

Untrusted application code starts using an initialized enclave typically by using the EENTER leaf function provided by Intel SGX to transfer control to the enclave code residing in the protected Enclave Page Cache (EPC). The enclave code returns to the caller via the EEXIT leaf function. Upon enclave entry, control is transferred by hardware to software inside the enclave. The software inside the enclave switches the stack pointer to one inside the enclave. When returning back from the enclave, the software swaps back the stack pointer then executes the EEXIT leaf function.

On processors that support the SGX2 extensions, an enclave writer may add memory to an enclave using the SGX2 instruction set, after the enclave is built and running. These instructions allow adding additional memory resources to the enclave for use in such areas as the heap. In addition, SGX2 instructions allow the enclave to add new threads to the enclave. The SGX2 features provide additional capabilities to the software model without changing the security properties of the Intel SGX architecture.

Calling an external procedure from an enclave could be done using the EEXIT leaf function. Software would use EEXIT and a software convention between the trusted section and the untrusted section.

An active enclave consumes resources from the Enclave Page Cache (EPC, see Section 36.5). Intel SGX provides the EREMOVE instruction that an EPC manager can use to reclaim EPC pages committed to an enclave. The EPC manager uses EREMOVE on every enclave page when the enclave is torn down. After successful execution of EREMOVE the EPC page is available for allocation to another enclave.

### 36.4 DATA STRUCTURES AND ENCLAVE OPERATION

There are 2 main data structures associated with operating an enclave, the SGX Enclave Control Structure (SECS, see Section 37.7) and the Thread Control Structure (TCS, see Section 37.8).

There is one SECS for each enclave. The SECS contains meta-data about the enclave which is used by the hardware and cannot be directly accessed by software. Included in the SECS is a field that stores the enclave build measurement value. This field, MRENCLAVE, is initialized by the ECREATE instruction and updated by every EADD and EEXTEND. It is locked by EINIT.

Every enclave contains one or more TCS structures. The TCS contains meta-data used by the hardware to save and restore thread specific information when entering/exiting the enclave. There is one field, FLAGS, that may be accessed by software. This field can only be accessed by debug enclaves. The flag bit, DBGOPTIN, allows to single step into the thread associated with the TCS. (see Section 37.8.1)

The SECS is created when ECREATE (see Table 36-1) is executed. The TCS can be created using the EADD instruction or the SGX2 instructions (see Table 36-2).

### 36.5 ENCLAVE PAGE CACHE

The Enclave Page Cache (EPC) is the secure storage used to store enclave pages when they are a part of an executing enclave. For an EPC page, hardware performs additional access control checks to restrict access to the page. After the current page access checks and translations are performed, the hardware checks that the EPC page

is accessible to the program currently executing. Generally an EPC page is only accessed by the owner of the executing enclave or an instruction which is setting up an EPC page

The EPC is divided into EPC pages. An EPC page is 4KB in size and always aligned on a 4KB boundary.

Pages in the EPC can either be valid or invalid. Every valid page in the EPC belongs to one enclave instance. Each enclave instance has an EPC page that holds its SECS. The security metadata for each EPC page is held in an internal micro-architectural structure called Enclave Page Cache Map (EPCM, see Section 36.5.1).

The EPC is managed by privileged software. Intel SGX provides a set of instructions for adding and removing content to and from the EPC. The EPC may be configured by BIOS at boot time. On implementations in which EPC memory is part of system DRAM, the contents of the EPC are protected by an encryption engine.

### 36.5.1 Enclave Page Cache Map (EPCM)

The EPCM is a secure structure used by the processor to track the contents of the EPC. The EPCM holds one entry for each page in the EPC. The format of the EPCM is micro-architectural, and consequently is implementation dependent. However, the EPCM contains the following architectural information:

- The status of EPC page with respect to validity and accessibility.
- An SECS identifier (see Section 37.19) of the enclave to which the page belongs.
- The type of page: regular, SECS, TCS or VA.
- The linear address through which the enclave is allowed to access the page.
- The specified read/write/execute permissions on that page.

The EPCM structure is used by the CPU in the address-translation flow to enforce access-control on the EPC pages. The EPCM structure is described in Table 37-27, and the conceptual access-control flow is described in Section 37.5.

The EPCM entries are managed by the processor as part of various instruction flows.

## 36.6 ENCLAVE INSTRUCTIONS AND INTEL® SGX

The enclave instructions available with Intel SGX are organized as leaf functions under three instruction mnemonics: ENCLS (ring 0), ENCLU (ring 3), and ENCLV (VT root mode). Each leaf function uses EAX to specify the leaf function index, and may require additional implicit input registers as parameters. The use of EAX is implied implicitly by the ENCLS, ENCLU, and ENCLV instructions; ModR/M byte encoding is not used with ENCLS, ENCLU, and ENCLV. The use of additional registers does not use ModR/M encoding and is implied implicitly by the respective leaf function index.

Each leaf function index is also associated with a unique, leaf-specific mnemonic. A long-form expression of Intel SGX instruction takes the form of ENCLx[LEAF\_MNEMONIC], where 'x' is either 'S', 'U', or 'V'. The long-form expression provides clear association of the privilege-level requirement of a given "leaf mnemonic". For simplicity, the unique "Leaf\_Mnemonic" name is used (omitting the ENCLx for convenience) throughout in this document.

Details of individual SGX leaf functions are described in Chapter 40. Table 36-1 provides a summary of the instruction leaves that are available in the initial implementation of Intel SGX, which is introduced in the 6th generation Intel Core processors. Table 36-2 summarizes enhancement of Intel SGX for future Intel processors.

**Table 36-1. Supervisor and User Mode Enclave Instruction Leaf Functions in Long-Form of SGX1**

| Supervisor Instruction | Description                                 | User Instruction | Description                    |
|------------------------|---|------------------|--------------------------------|
| ENCLS[EADD]            | Add an EPC page to an enclave.              | ENCLU[EENTER]    | Enter an enclave.              |
| ENCLS[EBLOCK]          | Block an EPC page.                          | ENCLU[EEXIT]     | Exit an enclave.               |
| ENCLS[ECREATE]         | Create an enclave.                          | ENCLU[EGETKEY]   | Create a cryptographic key.    |
| ENCLS[EDBGDR]          | Read data from a debug enclave by debugger. | ENCLU[EREPORT]   | Create a cryptographic report. |

**Table 36-1. Supervisor and User Mode Enclave Instruction Leaf Functions in Long-Form of SGX1**

| Supervisor Instruction | Description                                  | User Instruction | Description          |
|------------------------|--|------------------|----------------------|
| ENCLS[EDBGWR]          | Write data into a debug enclave by debugger. | ENCLU[ERESUME]   | Re-enter an enclave. |
| ENCLS[EEXTEND]         | Extend EPC page measurement.                 |                  |                      |
| ENCLS[EINIT]           | Initialize an enclave.                       |                  |                      |
| ENCLS[ELDB]            | Load an EPC page in blocked state.           |                  |                      |
| ENCLS[ELDU]            | Load an EPC page in unblocked state.         |                  |                      |
| ENCLS[EPA]             | Add an EPC page to create a version array.   |                  |                      |
| ENCLS[EREMOVE]         | Remove an EPC page from an enclave.          |                  |                      |
| ENCLS[ETRACK]          | Activate EBLOCK checks.                      |                  |                      |
| ENCLS[EWB]             | Write back/invalidate an EPC page.           |                  |                      |

**Table 36-2. Supervisor and User Mode Enclave Instruction Leaf Functions in Long-Form of SGX2**

| Supervisor Instruction | Description                               | User Instruction   | Description  |
|------------------------|---|--------------------|--|
| ENCLS[EAUG]            | Allocate EPC page to an existing enclave. | ENCLU[EACCEPT]     | Accept EPC page into the enclave.  |
| ENCLS[EMODPR]          | Restrict page permissions.                | ENCLU[EMODPE]      | Enhance page permissions.  |
| ENCLS[EMODT]           | Modify EPC page type.                     | ENCLU[EACCEPTCOPY] | Copy contents to an augmented EPC page and accept the EPC page into the enclave. |

**Table 36-3. VMX Operation and Supervisor Mode Enclave Instruction Leaf Functions in Long-Form of OVERSUB**

| Supervisor Instruction | Description                             | User Instruction | Description                                     |
|------------------------|---|------------------|---|
| ENCLV[EDECVRTCHILD]    | Decrement the virtual child page count. | ENCLS[ERDINFO]   | Read information about EPC page.                |
| ENCLV[EINCVIRTCHILD]   | Increment the virtual child page count. | ENCLS[TRACKC]    | Activate EBLOCK checks with conflict reporting. |
| ENCLV[ESETCONTEXT]     | Set virtualization context.             | ENCLS[ELDBC/UC]  | Load an EPC page with conflict reporting.       |

## 36.7 DISCOVERING SUPPORT FOR INTEL® SGX AND ENABLING ENCLAVE INSTRUCTIONS

Detection of support of Intel SGX and enumeration of available and enabled Intel SGX resources are queried using the CPUID instruction. The enumeration interface comprises the following:

- Processor support of Intel SGX is enumerated by a feature flag in CPUID leaf 07H: CPUID.(EAX=07H, ECX=0H):EBX.SGX[bit 2]. If CPUID.(EAX=07H, ECX=0H):EBX.SGX = 1, the processor has support for Intel SGX, and requires opt-in enabling by BIOS via IA32\_FEATURE\_CONTROL MSR.  
If CPUID.(EAX=07H, ECX=0H):EBX.SGX = 1, CPUID will report via the available sub-leaves of CPUID.(EAX=12H) on available and/or configured Intel SGX resources.
- The available and configured Intel SGX resources enumerated by the sub-leaves of CPUID.(EAX=12H) depend on the state of BIOS configuration.

### 36.7.1 Intel® SGX Opt-In Configuration

On processors that support Intel SGX, IA32\_FEATURE\_CONTROL provides the SGX\_ENABLE field (bit 18). Before system software can configure and enable Intel SGX resources, BIOS is required to set IA32\_FEATURE\_CONTROL.SGX\_ENABLE = 1 to opt-in the use of Intel SGX by system software.

The semantics of setting SGX\_ENABLE follows the rules of IA32\_FEATURE\_CONTROL.LOCK (bit 0). Software is considered to have opted into Intel SGX if and only if IA32\_FEATURE\_CONTROL.SGX\_ENABLE and IA32\_FEATURE\_CONTROL.LOCK are set to 1. The setting of IA32\_FEATURE\_CONTROL.SGX\_ENABLE (bit 18) is not reflected by CPUID.

**Table 36-4. Intel® SGX Opt-in and Enabling Behavior**

| CPUID.(07H,0H):EBX.SGX   | CPUID.(12H) | FEATURE_CONTROL.LOCK | FEATURE_CONTROL.SGX_ENABLE | Enclave Instruction                                      |
|--|-------------|----------------------|----------------------------|--|
| 0  | Invalid     | X                    | X                          | #UD  |

### 36.7.2 Intel® SGX Resource Enumeration Leaves

If CPUID.(EAX=07H, ECX=0H):EBX.SGX = 1, the processor also supports querying CPUID with EAX=12H on Intel SGX resource capability and configuration. The number of available sub-leaves in leaf 12H depends on the Opt-in and system software configuration. Information returned by CPUID.12H is thread specific; software should not assume that if Intel SGX instructions are supported on one hardware thread, they are also supported elsewhere.

A properly configured processor exposes Intel SGX functionality with CPUID.EAX=12H reporting valid information (non-zero content) in three or more sub-leaves, see Table 36-5.

- CPUID.(EAX=12H, ECX=0H) enumerates Intel SGX capability, including enclave instruction opcode support.
- CPUID.(EAX=12H, ECX=1H) enumerates Intel SGX capability of processor state configuration and enclave configuration in the SECS structure (see Table 37-3).
- CPUID.(EAX=12H, ECX > 1) enumerates available EPC resources.

**Table 36-5. CPUID Leaf 12H, Sub-Leaf 0 Enumeration of Intel® SGX Capabilities**

| CPUID.(EAX=12H,ECX=0) |      | Description Behavior   |
|-----------------------|------|--|
| Register              | Bits |  |
| EAX                   | 0    | SGX1: If 1, indicates leaf functions of SGX1 instruction listed in Table 36-1 are supported.                         |
|                       | 1    | SGX2: If 1, indicates leaf functions of SGX2 instruction listed in Table 36-2 are supported.                         |
|                       | 4:2  | Reserved (0)   |
|                       | 5    | OVERSUB: If 1, indicates Intel SGX supports instructions: EINC VIRTCHILD, EDEC VIRTCHILD, and ESETCONTEXT.           |
|                       | 6    | OVERSUB: If 1, indicates Intel SGX supports instructions: ETRACKC, ERDINFO, ELDBC, and ELDUC.                        |
|                       | 31:7 | Reserved (0)   |
| EBX                   | 31:0 | MISCSELECT: Reports the bit vector of supported extended features that can be written to the MISC region of the SSA. |
| ECX                   | 31:0 | Reserved (0).  |

**Table 36-5. CPUID Leaf 12H, Sub-Leaf 0 Enumeration of Intel® SGX Capabilities**

| CPUID.(EAX=12H,ECX=0) |       | Description Behavior  |
|-----------------------|-------|---|
| Register              | Bits  |   |
| EDX                   | 7:0   | MaxEnclaveSize_Not64: the maximum supported enclave size is $2^{(EDX[7:0])}$ bytes when not in 64-bit mode.     |
|                       | 15:8  | MaxEnclaveSize_64: the maximum supported enclave size is $2^{(EDX[15:8])}$ bytes when operating in 64-bit mode. |
|                       | 31:16 | Reserved (0).   |

**Table 36-6. CPUID Leaf 12H, Sub-Leaf 1 Enumeration of Intel® SGX Capabilities**

| CPUID.(EAX=12H,ECX=1) |      | Description Behavior   |
|-----------------------|------|--|
| Register              | Bits |  |
| EAX                   | 31:0 | Report the valid bits of SECS.ATTRIBUTES[31:0] that software can set with ECREATE. SECS.ATTRIBUTES[n] can be set to 1 using ECREATE only if EAX[n] is 1, where $n < 32$ .      |
| EBX                   | 31:0 | Report the valid bits of SECS.ATTRIBUTES[63:32] that software can set with ECREATE. SECS.ATTRIBUTES[n+32] can be set to 1 using ECREATE only if EBX[n] is 1, where $n < 32$ .  |
| ECX                   | 31:0 | Report the valid bits of SECS.ATTRIBUTES[95:64] that software can set with ECREATE. SECS.ATTRIBUTES[n+64] can be set to 1 using ECREATE only if ECX[n] is 1, where $n < 32$ .  |
| EDX                   | 31:0 | Report the valid bits of SECS.ATTRIBUTES[127:96] that software can set with ECREATE. SECS.ATTRIBUTES[n+96] can be set to 1 using ECREATE only if EDX[n] is 1, where $n < 32$ . |

On processors that support Intel SGX1 and SGX2, CPUID leaf 12H sub-leaf 2 report physical memory resources available for use with Intel SGX. These physical memory sections are typically allocated by BIOS as Processor Reserved Memory, and available to the OS to manage as EPC.

To enumerate how many EPC sections are available to the EPC manager, software can enumerate CPUID leaf 12H with sub-leaf index starting from 2, and decode the sub-leaf-type encoding (returned in EAX[3:0]) until the sub-leaf type is invalid. All invalid sub-leaves of CPUID leaf 12H return EAX/EBX/ECX/EDX with 0.

**Table 36-7. CPUID Leaf 12H, Sub-Leaf Index 2 or Higher Enumeration of Intel® SGX Resources**

| CPUID.(EAX=12H,ECX > 1) |       | Description Behavior   |
|-------------------------|-------|--|
| Register                | Bits  |  |
| EAX                     | 3:0   | 0000b: This sub-leaf is invalid; EDX:ECX:EBX:EAX return 0.<br>0001b: This sub-leaf enumerates an EPC section. EBX:EAX and EDX:ECX provide information on the Enclave Page Cache (EPC) section.<br>All other encoding are reserved. |
|                         | 11:4  | Reserved (enumerate 0).  |
|                         | 31:12 | If EAX[3:0] = 0001b, these are bits 31:12 of the physical address of the base of the EPC section.  |
| EBX                     | 19:0  | If EAX[3:0] = 0001b, these are bits 51:32 of the physical address of the base of the EPC section.  |
|                         | 31:20 | Reserved.  |
| ECX                     | 3:0   | If EAX[3:0] 0000b, then all bits of the EDX:ECX pair are enumerated as 0.<br>If EAX[3:0] 0001b, then this section has confidentiality and integrity protection.<br>All other encoding are reserved.                                |
|                         | 11:4  | Reserved (enumerate 0).  |
|                         | 31:12 | If EAX[3:0] = 0001b, these are bits 31:12 of the size of the corresponding EPC section within the Processor Reserved Memory.   |

**Table 36-7. CPUID Leaf 12H, Sub-Leaf Index 2 or Higher Enumeration of Intel® SGX Resources**

| CPUID.(EAX=12H,ECX > 1) |       | Description Behavior   |
|-------------------------|-------|--|
| Register                | Bits  |  |
| EDX                     | 19: 0 | If EAX[3:0] = 0001b, these are bits 51:32 of the size of the corresponding EPC section within the Processor Reserved Memory. |
|                         | 31:20 | Reserved.  |

## 24. Updates to Chapter 37, Volume 3D

Change bars show changes to Chapter 37 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

-----  
Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

## CHAPTER 37

# ENCLAVE ACCESS CONTROL AND DATA STRUCTURES

---

### 37.1 OVERVIEW OF ENCLAVE EXECUTION ENVIRONMENT

When an enclave is created, it has a range of linear addresses that the processor applies enhanced access control. This range is called the ELRANGE (see Section 36.3). When an enclave generates a memory access, the existing IA32 segmentation and paging architecture are applied. Additionally, linear addresses inside the ELRANGE must map to an EPC page otherwise when an enclave attempts to access that linear address a fault is generated.

The EPC pages need not be physically contiguous. System software allocates EPC pages to various enclaves. Enclaves must abide by OS/VMM imposed segmentation and paging policies. OS/VMM-managed page tables and extended page tables provide address translation for the enclave pages. Hardware requires that these pages are properly mapped to EPC (any failure generates an exception).

Enclave entry must happen through specific enclave instructions:

- ENCLU[EENTER], ENCLU[ERESUME].

Enclave exit must happen through specific enclave instructions or events:

- ENCLU[EEXIT], Asynchronous Enclave Exit (AEX).

Attempts to execute, read, or write to linear addresses mapped to EPC pages when not inside an enclave will result in the processor altering the access to preserve the confidentiality and integrity of the enclave. The exact behavior may be different between implementations. As an example a read of an enclave page may result in the return of all one's or return of cyphertext of the cache line. Writing to an enclave page may result in a dropped write or a machine check at a later time. The processor will provide the protections as described in Section 37.4 and Section 37.5 on such accesses.

### 37.2 TERMINOLOGY

A memory access to the ELRANGE and initiated by an instruction executed by an enclave is called a Direct Enclave Access (Direct EA).

Memory accesses initiated by certain Intel® SGX instruction leaf functions such as ECREATE, EADD, EDBGRD, EDBGWR, ELDU/ELDB, EWB, EREMOVE, EENTER, and ERESUME to EPC pages are called Indirect Enclave Accesses (Indirect EA). Table 37-1 lists additional details of the indirect EA of SGX1 and SGX2 extensions.

Direct EAs and Indirect EAs together are called Enclave Accesses (EAs).

Any memory access that is not an Enclave Access is called a non-enclave access.

### 37.3 ACCESS-CONTROL REQUIREMENTS

Enclave accesses have the following access-control attributes:

- All memory accesses must conform to segmentation and paging protection mechanisms.
- Code fetches from inside an enclave to a linear address outside that enclave result in a #GP(0) exception.
- Non-enclave accesses to EPC memory result in undefined behavior. EPC memory is protected as described in Section 37.4 and Section 37.5 on such accesses.
- EPC pages of page types PT\_REG, PT\_TCS and PT\_TRIM must be mapped to ELRANGE at the linear address specified when the EPC page was allocated to the enclave using ENCLS[EADD] or ENCLS[EAUG] leaf functions. Enclave accesses through other linear address result in a #PF with the PFEC.SGX bit set.
- Direct EAs to any EPC pages must conform to the currently defined security attributes for that EPC page in the EPCM. These attributes may be defined at enclave creation time (EADD) or when the enclave sets them using SGX2 instructions. The failure of these checks results in a #PF with the PFEC.SGX bit set.

- Target page must belong to the currently executing enclave.
- Data may be written to an EPC page if the EPCM allow write access.
- Data may be read from an EPC page if the EPCM allow read access.
- Instruction fetches from an EPC page are allowed if the EPCM allows execute access.
- Target page must not have a restricted page type<sup>1</sup> (PT\_SECS, PT\_TCS, PT\_VA, or PT\_TRIM).
- The EPC page must not be BLOCKED.
- The EPC page must not be PENDING.
- The EPC page must not be MODIFIED.

## 37.4 SEGMENT-BASED ACCESS CONTROL

Intel SGX architecture does not modify the segment checks performed by a logical processor. All memory accesses arising from a logical processor in protected mode (including enclave access) are subject to segmentation checks with the applicable segment register.

To ensure that outside entities do not modify the enclave's logical-to-linear address translation in an unexpected fashion, ENCLU[EENTER] and ENCLU[ERESUME] check that CS, DS, ES, and SS, if usable (i.e., not null), have segment base value of zero. A non-zero segment base value for these registers results in a #GP(0).

On enclave entry either via EENTER or ERESUME, the processor saves the contents of the external FS and GS registers, and loads these registers with values stored in the TCS at build time to enable the enclave's use of these registers for accessing the thread-local storage inside the enclave. On EEXIT and AEX, the contents at time of entry are restored. On AEX, the values of FS and GS are saved in the SSA frame. On ERESUME, FS and GS are restored from the SSA frame. The details of these operations can be found in the descriptions of EENTER, ERESUME, EEXIT, and AEX flows.

## 37.5 PAGE-BASED ACCESS CONTROL

### 37.5.1 Access-control for Accesses that Originate from non-SGX Instructions

Intel SGX builds on the processor's paging mechanism to provide page-granular access-control for enclave pages. Enclave pages are only accessible from inside the currently executing enclave if they belong to that enclave. In addition, enclave accesses must conform to the access control requirements described in Section 37.3. or through certain Intel SGX instructions. Attempts to execute, read, or write to linear addresses mapped to EPC pages when not inside an enclave will result in the processor altering the access to preserve the confidentiality and integrity of the enclave. The exact behavior may be different between implementations.

### 37.5.2 Memory Accesses that Split across ELRANGE

Memory data accesses are allowed to split across ELRANGE (i.e., a part of the access is inside ELRANGE and a part of the access is outside ELRANGE) while the processor is inside an enclave. If an access splits across ELRANGE, the processor splits the access into two sub-accesses (one inside ELRANGE and the other outside ELRANGE), and each access is evaluated. A code-fetch access that splits across ELRANGE results in a #GP due to the portion that lies outside of the ELRANGE.

### 37.5.3 Implicit vs. Explicit Accesses

Memory accesses originating from Intel SGX instruction leaf functions are categorized as either explicit accesses or implicit accesses. Table 37-1 lists the implicit and explicit memory accesses made by Intel SGX leaf functions.

1. EPCM may allow write, read or execute access only for pages with page type PT\_REG.

### 37.5.3.1 Explicit Accesses

Accesses to memory locations provided as explicit operands to Intel SGX instruction leaf functions, or their linked data structures are called explicit accesses.

Explicit accesses are always made using logical addresses. These accesses are subject to segmentation, paging, extended paging, and APIC-virtualization checks, and trigger any faults/exit associated with these checks when the access is made.

The interaction of explicit memory accesses with data breakpoints is leaf-function-specific, and is documented in Section 42.3.4.

### 37.5.3.2 Implicit Accesses

Accesses to data structures whose physical addresses are cached by the processor are called implicit accesses. These addresses are not passed as operands of the instruction but are implied by use of the instruction.

These accesses do not trigger any access-control faults/exits or data breakpoints. Table 37-1 lists memory objects that Intel SGX instruction leaf functions access either by explicit access or implicit access. The addresses of explicit access objects are passed via register operands with the second through fourth column of Table 37-1 matching implicitly encoded registers RBX, RCX, RDX.

Physical addresses used in different implicit accesses are cached via different instructions and for different durations. The physical address of SECS associated with each EPC page is cached at the time the page is added to the enclave via ENCLS[EADD] or ENCLS[EAUG], or when the page is loaded to EPC via ENCLS[ELDB] or ENCLS[ELDU]. This binding is severed when the corresponding page is removed from the EPC via ENCLS[EREMOVE] or ENCLS[EWB]. Physical addresses of TCS and SSA pages are cached at the time of most-recent enclave entry. Exit from an enclave (ENCLU[EEXIT] or AEX) flushes this caching. Details of Asynchronous Enclave Exit is described in Chapter 39.

The physical addresses that are cached for use by implicit accesses are derived from logical (or linear) addresses after checks such as segmentation, paging, EPT, and APIC virtualization checks. These checks may trigger exceptions or VM exits. Note, however, that such exception or VM exits may not occur after a physical address is cached and used for an implicit access.

**Table 37-1. List of Implicit and Explicit Memory Access by Intel® SGX Enclave Instructions**

| Instr. Leaf   | Enum.   | Explicit 1                           | Explicit 2    | Explicit 3    | Implicit  |
|---------------|---------|--------------------------------------|---------------|---------------|-----------|

| *Details of Asynchronous Enclave Exit (AEX) is described in Section 39.4 |         |                                      |            |              |                |

## 37.6 INTEL® SGX DATA STRUCTURES OVERVIEW

Enclave operation is managed via a collection of data structures. Many of the top-level data structures contain sub-structures. The top-level data structures relate to parameters that may be used in enclave setup/maintenance, by Intel SGX instructions, or AEX event. The top-level data structures are:

- SGX Enclave Control Structure (SECS)
- Thread Control Structure (TCS)
- State Save Area (SSA)
- Page Information (PAGEINFO)
- Security Information (SECINFO)
- Paging Crypto MetaData (PCMD)
- Enclave Signature Structure (SIGSTRUCT)
- EINIT Token Structure (EINITTOKEN)
- Report Structure (REPORT)
- Report Target Info (TARGETINFO)
- Key Request (KEYREQUEST)
- Version Array (VA)
- Enclave Page Cache Map (EPCM)
- Read Info (RDINFO)

Details of the top-level data structures and associated sub-structures are listed in Section 37.7 through Section 37.19.

## 37.7 SGX ENCLAVE CONTROL STRUCTURE (SECS)

The SECS data structure requires 4K-Bytes alignment.

**Table 37-2. Layout of SGX Enclave Control Structure (SECS)**

| Field        | OFFSET (Bytes) | Size (Bytes) | Description  |
|--------------|----------------|--------------|--|
| SIZE         | 0              | 8            | Size of enclave in bytes; must be power of 2.  |
| BASEADDR     | 8              | 8            | Enclave Base Linear Address must be naturally aligned to size.   |
| SSAFRAMESIZE | 16             | 4            | Size of one SSA frame in pages, including XSAVE, pad, GPR, and MISC (if CPUID.(EAX=12H, ECX=0):EBX != 0).  |
| MISCSELECT   | 20             | 4            | Bit vector specifying which extended features are saved to the MISC region (see Section 37.7.2) of the SSA frame when an AEX occurs.   |
| RESERVED     | 24             | 24           |  |
| ATTRIBUTES   | 48             | 16           | Attributes of the Enclave, see Table 37-3.   |
| MRENCLAVE    | 64             | 32           | Measurement Register of enclave build process. See SIGSTRUCT for format.   |
| RESERVED     | 96             | 32           |  |
| MRSIGNER     | 128            | 32           | Measurement Register extended with the public key that verified the enclave. See SIGSTRUCT for format.   |
| RESERVED     | 160            | 32           |  |
| CONFIGID     | 192            | 64           | Post EINIT configuration identity.   |
| ISVPRODID    | 256            | 2            | Product ID of enclave.   |
| ISVSVN       | 258            | 2            | Security version number (SVN) of the enclave.  |
| CONFIGSVN    | 260            | 2            | Post EINIT configuration security version number (SVN).  |
| RESERVED     | 260            | 3834         | <p>The RESERVED field consists of the following:</p> <ul style="list-style-type: none"> <li>▪ EID: An 8 byte Enclave Identifier. Its location is implementation specific.</li> <li>▪ PAD: A 352 bytes padding pattern from the Signature (used for key derivation strings). It's location is implementation specific.</li> <li>▪ VIRTCHILDCNT: An 8 byte Count of virtual children that have been paged out by a VMM. Its location is implementation specific.</li> <li>▪ ENCLAVECONTEXT: An 8 byte Enclave context pointer. Its location is implementation specific.</li> <li>▪ ISVFAMILYID: A 16 byte value assigned to identify the family of products the enclave belongs to.</li> <li>▪ ISVEXTPRODID: A 16 byte value assigned to identify the product identity of the enclave.</li> <li>▪ The remaining 3226 bytes are reserved area.</li> </ul> <p>The entire 3836 byte field must be cleared prior to executing ECREATE.</p> |

### 37.7.1 ATTRIBUTES

The ATTRIBUTES data structure is comprised of bit-granular fields that are used in the SECS, the REPORT and the KEYREQUEST structures. CPUID.(EAX=12H, ECX=1) enumerates a bitmap of permitted 1-setting of bits in ATTRIBUTES.

**Table 37-3. Layout of ATTRIBUTES Structure**

| Field        | Bit Position | Description  |
|--------------|--------------|--|
| INIT         | 0            | This bit indicates if the enclave has been initialized by EINIT. It must be cleared when loaded as part of ECREATE. For EREPORT instruction, TARGET_INFO.ATTRIBUTES[ENIT] must always be 1 to match the state after EINIT has initialized the enclave. |
| DEBUG        | 1            | If 1, the enclave permit debugger to read and write enclave data using EDBGD and EDBGW.  |
| MODE64BIT    | 2            | Enclave runs in 64-bit mode.   |
| RESERVED     | 3            | Must be Zero.  |
| PROVISIONKEY | 4            | Provisioning Key is available from EGETKEY.  |

**Table 37-3. Layout of ATTRIBUTES Structure**

| Field          | Bit Position | Description                                   |
|----------------|--------------|---|
| EINITTOKEN_KEY | 5            | EINIT token key is available from EGETKEY.    |
| RESERVED       | 6            | Must be zero.                                 |
| KSS            | 7            | Key Separation and Sharing Enabled.           |
| RESERVED       | 63:8         | Must be zero.                                 |
| XFRM           | 127:64       | XSAVE Feature Request Mask. See Section 41.7. |

### 37.7.2 SECS.MISCSELECT Field

CPUID.(EAX=12H, ECX=0):EBX[31:0] enumerates which extended information that the processor can save into the MISC region of SSA when an AEX occurs. An enclave writer can specify via SIGSTRUCT how to set the SECS.MISCSELECT field. The bit vector of MISCSELECT selects which extended information is to be saved in the MISC region of the SSA frame when an AEX is generated. The bit vector definition of extended information is listed in Table 37-4.

If CPUID.(EAX=12H, ECX=0):EBX[31:0] = 0, SECS.MISCSELECT field must be all zeros.

The SECS.MISCSELECT field determines the size of MISC region of the SSA frame, see Section 37.9.2.

**Table 37-4. Bit Vector Layout of MISCSELECT Field of Extended Information**

| Field    | Bit Position | Description   |
|----------|--------------|---|
| EXINFO   | 0            | Report information about page fault and general protection exception that occurred inside an enclave. |
| Reserved | 31:1         | Reserved (0).   |

## 37.8 THREAD CONTROL STRUCTURE (TCS)

Each executing thread in the enclave is associated with a Thread Control Structure. It requires 4K-Bytes alignment.

**Table 37-5. Layout of Thread Control Structure (TCS)**

| Field    | OFFSET (Bytes) | Size (Bytes) | Description  |
|----------|----------------|--------------|--|
| STAGE    | 0              | 8            | Enclave execution state of the thread controlled by this TCS. A value of 0 indicates that this TCS is available for enclave entry. A value of 1 indicates that a processor is currently executing an enclave in the context of this TCS. |
| FLAGS    | 8              | 8            | The thread's execution flags (see Section 37.8.1).   |
| OSSA     | 16             | 8            | Offset of the base of the State Save Area stack, relative to the enclave base. Must be page aligned.   |
| CSSA     | 24             | 4            | Current slot index of an SSA frame, cleared by EADD and EACCEPT.   |
| NSSA     | 28             | 4            | Number of available slots for SSA frames.  |
| OENTRY   | 32             | 8            | Offset in enclave to which control is transferred on EENTER relative to the base of the enclave.   |
| AEP      | 40             | 8            | The value of the Asynchronous Exit Pointer that was saved at EENTER time.  |
| OFSBASGX | 48             | 8            | Offset to add to the base address of the enclave for producing the base address of FS segment inside the enclave. Must be page aligned.  |
| OGSBASGX | 56             | 8            | Offset to add to the base address of the enclave for producing the base address of GS segment inside the enclave. Must be page aligned.  |
| FSLIMIT  | 64             | 4            | Size to become the new FS limit in 32-bit mode.  |

**Table 37-5. Layout of Thread Control Structure (TCS)**

| Field    | OFFSET (Bytes) | Size (Bytes) | Description                                     |
|----------|----------------|--------------|---|
| GSLIMIT  | 68             | 4            | Size to become the new GS limit in 32-bit mode. |
| RESERVED | 72             | 4024         | Must be zero.                                   |

### 37.8.1 TCS.FLAGS

**Table 37-6. Layout of TCS.FLAGS Field**

| Field    | Bit Position | Description  |
|----------|--------------|--|
| DBGOPTIN | 0            | If set, allows debugging features (single-stepping, breakpoints, etc.) to be enabled and active while executing in the enclave on this TCS. Hardware clears this bit on EADD. A debugger may later modify it if the enclave's ATTRIBUTES.DEBUG is set. |
| RESERVED | 63:1         |  |

### 37.8.2 State Save Area Offset (OSSA)

The OSSA points to a stack of State Save Area (SSA) frames (see Section 37.9) used to save the processor state when an interrupt or exception occurs while executing in the enclave.

### 37.8.3 Current State Save Area Frame (CSSA)

CSSA is the index of the current SSA frame that will be used by the processor to determine where to save the processor state on an interrupt or exception that occurs while executing in the enclave. It is an index into the array of frames addressed by OSSA. CSSA is incremented on an AEX and decremented on an ERESUME.

### 37.8.4 Number of State Save Area Frames (NSSA)

NSSA specifies the number of SSA frames available for this TCS. There must be at least one available SSA frame when EENTER-ing the enclave or the EENTER will fail.

## 37.9 STATE SAVE AREA (SSA) FRAME

When an AEX occurs while running in an enclave, the architectural state is saved in the thread's current SSA frame, which is pointed to by TCS.CSSA. An SSA frame must be page aligned, and contains the following regions:

- The XSAVE region starts at the base of the SSA frame, this region contains extended feature register state in an XSAVE/FXSAVE-compatible non-compacted format.
- A Pad region: software may choose to maintain a pad region separating the XSAVE region and the MISC region. Software choose the size of the pad region according to the sizes of the MISC and GPRSGX regions.
- The GPRSGX region. The GPRSGX region is the last region of an SSA frame (see Table 37-7). This is used to hold the processor general purpose registers (RAX ... R15), the RIP, the outside RSP and RBP, RFLAGS and the AEX information.
- The MISC region (If CPUIDEAX=12H, ECX=0):EBX[31:0] != 0). The MISC region is adjacent to the GRPSGX region, and may contain zero or more components of extended information that would be saved when an AEX occurs. If the MISC region is absent, the region between the GPRSGX and XSAVE regions is the pad region that software can use. If the MISC region is present, the region between the MISC and XSAVE regions is the pad region that software can use. See additional details in Section 37.9.2.

**Table 37-7. Top-to-Bottom Layout of an SSA Frame**

| Region | Offset (Byte)                 | Size (Bytes)                                      | Description  |
|--------|-------------------------------|---|--|
| XSAVE  | 0                             | Calculate using CPUID leaf 0DH information        | The size of XSAVE region in SSA is derived from the enclave's support of the collection of processor extended states that would be managed by XSAVE. The enablement of those processor extended state components in conjunction with CPUID leaf 0DH information determines the XSAVE region size in SSA. |
| Pad    | End of XSAVE region           | Chosen by enclave writer                          | Ensure the end of GPRSGX region is aligned to the end of a 4KB page.   |
| MISC   | base of GPRSGX - sizeof(MISC) | Calculate from highest set bit of SECS.MISCSELECT | See Section 37.9.2.  |
| GPRSGX | SSAFRAMESIZE - 176            | 176   | See Table 37-8 for layout of the GPRSGX region.  |

### 37.9.1 GPRSGX Region

The layout of the GPRSGX region is shown in Table 37-8.

**Table 37-8. Layout of GPRSGX Portion of the State Save Area**

| Field    | OFFSET (Bytes) | Size (Bytes) | Description  |
|----------|----------------|--------------|--|
| RAX      | 0              | 8            |  |
| RCX      | 8              | 8            |  |
| RDX      | 16             | 8            |  |
| RBX      | 24             | 8            |  |
| RSP      | 32             | 8            |  |
| RBP      | 40             | 8            |  |
| RSI      | 48             | 8            |  |
| RDI      | 56             | 8            |  |
| R8       | 64             | 8            |  |
| R9       | 72             | 8            |  |
| R10      | 80             | 8            |  |
| R11      | 88             | 8            |  |
| R12      | 96             | 8            |  |
| R13      | 104            | 8            |  |
| R14      | 112            | 8            |  |
| R15      | 120            | 8            |  |
| RFLAGS   | 128            | 8            | Flag register.   |
| RIP      | 136            | 8            | Instruction pointer.   |
| URSP     | 144            | 8            | Non-Enclave (outside) stack pointer. Saved by EENTER, restored on AEX.   |
| URBP     | 152            | 8            | Non-Enclave (outside) RBP pointer. Saved by EENTER, restored on AEX.   |
| EXITINFO | 160            | 4            | Contains information about exceptions that cause AEXs, which might be needed by enclave software (see Section 37.9.1.1). |
| RESERVED | 164            | 4            |  |
| FSBASE   | 168            | 8            | FS BASE.   |
| GSBASE   | 176            | 8            | GS BASE.   |

### 37.9.1.1 EXITINFO

EXITINFO contains the information used to report exit reasons to software inside the enclave. It is a 4 byte field laid out as in Table 37-9. The VALID bit is set only for the exceptions conditions which are reported inside an enclave. See Table 37-10 for which exceptions are reported inside the enclave. If the exception condition is not one reported inside the enclave then VECTOR and EXIT\_TYPE are cleared.

**Table 37-9. Layout of EXITINFO Field**

| Field     | Bit Position | Description  |
|-----------|--------------|--|
| VECTOR    | 7:0          | Exception number of exceptions reported inside enclave.  |
| EXIT_TYPE | 10:8         | 011b: Hardware exceptions.<br>110b: Software exceptions.<br>Other values: Reserved.  |
| RESERVED  | 30:11        | Reserved as zero.  |
| VALID     | 31           | 0: unsupported exceptions.<br>1: Supported exceptions. Includes two categories: <ul style="list-style-type: none"> <li>Unconditionally supported exceptions: #DE, #DB, #BP, #BR, #UD, #MF, #AC, #XM.</li> <li>Conditionally supported exception: <ul style="list-style-type: none"> <li>#PF, #GP if SECS.MISCSELECT.EXITINFO = 1.</li> </ul> </li> </ul> |

### 37.9.1.2 VECTOR Field Definition

Table 37-10 contains the VECTOR field. This field contains information about some exceptions which occur inside the enclave. These vector values are the same as the values that would be used when vectoring into regular exception handlers. All values not shown are not reported inside an enclave.

**Table 37-10. Exception Vectors**

| Name | Vector # | Description  |
|------|----------|--|
| #DE  | 0        | Divider exception.   |
| #DB  | 1        | Debug exception.   |
| #BP  | 3        | Breakpoint exception.  |
| #BR  | 5        | Bound range exceeded exception.  |
| #UD  | 6        | Invalid opcode exception.  |
| #GP  | 13       | General protection exception. Only reported if SECS.MISCSELECT.EXITINFO = 1. |
| #PF  | 14       | Page fault exception. Only reported if SECS.MISCSELECT.EXITINFO = 1.         |
| #MF  | 16       | x87 FPU floating-point error.  |
| #AC  | 17       | Alignment check exceptions.  |
| #XM  | 19       | SIMD floating-point exceptions.  |

### 37.9.2 MISC Region

The layout of the MISC region is shown in Table 37-11. The number of components that the processor supports in the MISC region corresponds to the set bits of CPUID.(EAX=12H, ECX=0):EBX[31:0] set to 1. Each set bit in CPUID.(EAX=12H, ECX=0):EBX[31:0] has a defined size for the corresponding component, as shown in Table 37-11. Enclave writers needs to do the following:

- Decide which MISC region components will be supported for the enclave.
- Allocate an SSA frame large enough to hold the components chosen above.
- Instruct each enclave builder software to set the appropriate bits in SECS.MISCSELECT.

The first component, EXINFO, starts next to the GPRSGX region. Additional components in the MISC region grow in ascending order within the MISC region towards the XSAVE region.

The size of the MISC region is calculated as follows:

- If CPUID.(EAX=12H, ECX=0):EBX[31:0] = 0, MISC region is not supported.
- If CPUID.(EAX=12H, ECX=0):EBX[31:0] != 0, the size of MISC region is derived from sum of the highest bit set in SECS.MISCSELECT and the size of the MISC component corresponding to that bit. Offset and size information of currently defined MISC components are listed in Table 37-11. For example, if the highest bit set in SECS.MISCSELECT is bit 0, the MISC region offset is OFFSET(GPRSGX)-16 and size is 16 bytes.
- The processor saves a MISC component *i* in the MISC region if and only if SECS.MISCSELECT[*i*] is 1.

**Table 37-11. Layout of MISC region of the State Save Area**

| MISC Components  | OFFSET (Bytes)     | Size (Bytes) | Description  |
|------------------|--------------------|--------------|--|
| EXINFO           | Offset(GPRSGX) -16 | 16           | if CPUID.(EAX=12H, ECX=0):EBX[0] = 1, exception information on #GP or #PF that occurred inside an enclave can be written to the EXINFO structure if specified by SECS.MISCSELECT[0] = 1. |
| Future Extension | Below EXINFO       | TBD          | Reserved. (Zero size if CPUID.(EAX=12H, ECX=0):EBX[31:1] =0).  |

### 37.9.2.1 EXINFO Structure

Table 37-12 contains the layout of the EXINFO structure that provides additional information.

**Table 37-12. Layout of EXINFO Structure**

| Field    | OFFSET (Bytes) | Size (Bytes) | Description   |
|----------|----------------|--------------|---|
| MADDR    | 0              | 8            | If #PF: contains the page fault linear address that caused a page fault.<br>If #GP: the field is cleared. |
| ERRCD    | 8              | 4            | Exception error code for either #GP or #PF.   |
| RESERVED | 12             | 4            |   |

### 37.9.2.2 Page Fault Error Codes

Table 37-13 contains page fault error code that may be reported in EXINFO.ERRCD.

**Table 37-13. Page Fault Error Codes**

| Name             | Bit Position | Description                                     |
|------------------|--------------|---|
| P                | 0            | Same as non-SGX page fault exception P flag.    |
| W/R              | 1            | Same as non-SGX page fault exception W/R flag.  |
| U/S <sup>1</sup> | 2            | Always set to 1 (user mode reference).          |
| RSVD             | 3            | Same as non-SGX page fault exception RSVD flag. |
| I/D              | 4            | Same as non-SGX page fault exception I/D flag.  |
| PK               | 5            | Protection Key induced fault.                   |
| RSVD             | 14:6         | Reserved.                                       |
| SGX              | 15           | EPCM induced fault.                             |
| RSVD             | 31:5         | Reserved.                                       |

#### NOTES:

1. Page faults incident to enclave mode that report U/S=0 are not reported in EXINFO.

## 37.10 PAGE INFORMATION (PAGEINFO)

PAGEINFO is an architectural data structure that is used as a parameter to the EPC-management instructions. It requires 32-Byte alignment.

**Table 37-14. Layout of PAGEINFO Data Structure**

| Field        | OFFSET (Bytes) | Size (Bytes) | Description  |
|--------------|----------------|--------------|--|
| LINADDR      | 0              | 8            | Enclave linear address.  |
| SRCPGE       | 8              | 8            | Effective address of the page where contents are located.                              |
| SECINFO/PCMD | 16             | 8            | Effective address of the SECINFO or PCMD (for ELDU, ELDB, EWB) structure for the page. |
| SECS         | 24             | 8            | Effective address of EPC slot that currently contains the SECS.                        |

## 37.11 SECURITY INFORMATION (SECINFO)

The SECINFO data structure holds meta-data about an enclave page.

**Table 37-15. Layout of SECINFO Data Structure**

| Field    | OFFSET (Bytes) | Size (Bytes) | Description                                     |
|----------|----------------|--------------|---|
| FLAGS    | 0              | 8            | Flags describing the state of the enclave page. |
| RESERVED | 8              | 56           | Must be zero.                                   |

### 37.11.1 SECINFO.FLAGS

The SECINFO.FLAGS are a set of fields describing the properties of an enclave page.

**Table 37-16. Layout of SECINFO.FLAGS Field**

| Field     | Bit Position | Description   |
|-----------|--------------|---|
| R         | 0            | If 1 indicates that the page can be read from inside the enclave; otherwise the page cannot be read from inside the enclave.                        |
| W         | 1            | If 1 indicates that the page can be written from inside the enclave; otherwise the page cannot be written from inside the enclave.                  |
| X         | 2            | If 1 indicates that the page can be executed from inside the enclave; otherwise the page cannot be executed from inside the enclave.                |
| PENDING   | 3            | If 1 indicates that the page is in the PENDING state; otherwise the page is not in the PENDING state.   |
| MODIFIED  | 4            | If 1 indicates that the page is in the MODIFIED state; otherwise the page is not in the MODIFIED state.   |
| PR        | 5            | If 1 indicates that a permission restriction operation on the page is in progress, otherwise a permission restriction operation is not in progress. |
| RESERVED  | 7:6          | Must be zero.   |
| PAGE_TYPE | 15:8         | The type of page that the SECINFO is associated with.   |
| RESERVED  | 63:16        | Must be zero.   |

### 37.11.2 PAGE\_TYPE Field Definition

The SECINFO flags and EPC flags contain bits indicating the type of page.

**Table 37-17. Supported PAGE\_TYPE**

| TYPE    | Value     | Description               |
|---------|-----------|---------------------------|
| PT_SECS | 0         | Page is an SECS.          |
| PT_TCS  | 1         | Page is a TCS.            |
| PT_REG  | 2         | Page is a regular page.   |
| PT_VA   | 3         | Page is a Version Array.  |
| PT_TRIM | 4         | Page is in trimmed state. |
|         | All other | Reserved.                 |

## 37.12 PAGING CRYPTO METADATA (PCMD)

The PCMD structure is used to keep track of crypto meta-data associated with a paged-out page. Combined with PAGEINFO, it provides enough information for the processor to verify, decrypt, and reload a paged-out EPC page. The size of the PCMD structure (128 bytes) is architectural.

EWB calculates the Message Authentication Code (MAC) value and writes out the PCMD. ELDB/U reads the fields and checks the MAC.

The format of PCMD is as follows:

**Table 37-18. Layout of PCMD Data Structure**

| Field     | OFFSET (Bytes) | Size (Bytes) | Description  |
|-----------|----------------|--------------|--|
| SECINFO   | 0              | 64           | Flags describing the state of the enclave page; R/W by software.                                     |
| ENCLAVEID | 64             | 8            | Enclave Identifier used to establish a cryptographic binding between paged-out page and the enclave. |
| RESERVED  | 72             | 40           | Must be zero.  |
| MAC       | 112            | 16           | Message Authentication Code for the page, page meta-data and reserved field.                         |

## 37.13 ENCLAVE SIGNATURE STRUCTURE (SIGSTRUCT)

SIGSTRUCT is a structure created and signed by the enclave developer that contains information about the enclave. SIGSTRUCT is processed by the EINIT leaf function to verify that the enclave was properly built.

SIGSTRUCT includes ENCLAVEHASH as SHA256 digest, as defined in FIPS PUB 180-4. The digests are byte strings of length 32. Each of the 8 HASH dwords is stored in little-endian order.

SIGSTRUCT includes four 3072-bit integers (MODULUS, SIGNATURE, Q1, Q2). Each such integer is represented as a byte strings of length 384, with the most significant byte at the position “offset + 383”, and the least significant byte at position “offset”.

The (3072-bit integer) SIGNATURE should be an RSA signature, where: a) the RSA modulus (MODULUS) is a 3072-bit integer; b) the public exponent is set to 3; c) the signing procedure uses the EMSA-PKCS1-v1.5 format with DER encoding of the “DigestInfo” value as specified in of PKCS#1 v2.1/RFC 3447.

The 3072-bit integers Q1 and Q2 are defined by:

$q1 = \text{floor}(\text{Signature}^2 / \text{Modulus});$

$q2 = \text{floor}((\text{Signature}^3 - q1 * \text{Signature} * \text{Modulus}) / \text{Modulus});$

SIGSTRUCT must be page aligned

In column 5 of Table 37-19, 'Y' indicates that this field should be included in the signature generated by the developer.

**Table 37-19. Layout of Enclave Signature Structure (SIGSTRUCT)**

| Field   | OFFSET (Bytes) | Size (Bytes) | Description  | Signed |
|---|----------------|--------------|--|--------|
| HEADER  | 0              | 16           | Must be byte stream<br>06000000E1000000000010000000000H                | Y      |
| VENDOR  | 16             | 4            | Intel Enclave: 00008086H<br>Non-Intel Enclave: 00000000H               | Y      |

| HEADER2   | 24             | 16           | Must be byte stream<br>01010000600000006000000001000000H               | Y      |
| SWDEFINED   | 40             | 4            | Available for software use.  | Y      |
| RESERVED  | 44             | 84           | Must be zero.  | Y      |
| MODULUS   | 128            | 384          | Module Public Key (keylength=3072 bits).                               | N      |
| EXPONENT  | 512            | 4            | RSA Exponent = 3.  | N      |
| SIGNATURE   | 516            | 384          | Signature over Header and Body.  | N      |
| MISCSELECT*   | 900            | 4            | Bit vector specifying Extended SSA frame feature set to be used.       | Y      |
| MISCMASK*   | 904            | 4            | Bit vector mask of MISCSELECT to enforce.                              | Y      |
| RESERVED  | 908            | 4            | Must be zero.  | Y      |
| ISVFAMILYID   | 912            | 16           | ISV assigned Product Family ID.  | Y      |
| ATTRIBUTES  | 928            | 16           | Enclave Attributes that must be set.                                   | Y      |
| ATTRIBUTEMASK   | 944            | 16           | Mask of Attributes to enforce.   | Y      |
| ENCLAVEHASH   | 960            | 32           | MRENCLAVE of enclave this structure applies to.                        | Y      |
| RESERVED  | 992            | 16           | Must be zero.  | Y      |
| ISVEXTPRODID  | 1008           | 16           | ISV assigned extended Product ID.                                      | Y      |
| ISVPRODID   | 1024           | 2            | ISV assigned Product ID.   | Y      |
| ISVSVN  | 1026           | 2            | ISV assigned SVN (security version number).                            | Y      |
| RESERVED  | 1028           | 12           | Must be zero.  | N      |
| Q1  | 1040           | 384          | Q1 value for RSA Signature Verification.                               | N      |
| Q2  | 1424           | 384          | Q2 value for RSA Signature Verification.                               | N      |
| * If CPUID.(EAX=12H, ECX=0):EBX[31:0] = 0, MISCSELECT must be 0.<br>If CPUID.(EAX=12H, ECX=0):EBX[31:0] !=0, enclave writers must specify MISCSELECT such that each cleared bit in MISCMASK must also specify the corresponding bit as 0 in MISCSELECT. |                |              |  |        |

## 37.14 EINIT TOKEN STRUCTURE (EINITTOKEN)

The EINIT token is used by EINIT to verify that the enclave is permitted to launch. EINIT token is generated by an enclave in possession of the EINITTOKEN key (the Launch Enclave).

EINIT token must be 512-Byte aligned.

**Table 37-20. Layout of EINIT Token (EINITTOKEN)**

| Field              | OFFSET (Bytes) | Size (Bytes) | MACed | Description   |
|--------------------|----------------|--------------|-------|---|
| Valid              | 0              | 4            | Y     | Bit 0: 1: Valid; 0: Invalid.<br>All other bits reserved.  |
| RESERVED           | 4              | 44           | Y     | Must be zero.   |
| ATTRIBUTES         | 48             | 16           | Y     | ATTRIBUTES of the Enclave.  |
| MRENCLAVE          | 64             | 32           | Y     | MRENCLAVE of the Enclave.   |
| RESERVED           | 96             | 32           | Y     | Reserved.   |
| MRSIGNER           | 128            | 32           | Y     | MRSIGNER of the Enclave.  |
| RESERVED           | 160            | 32           | Y     | Reserved.   |
| CPUSVNLE           | 192            | 16           | N     | Launch Enclave's CPUSVN.  |
| ISVPRODIDLE        | 208            | 02           | N     | Launch Enclave's ISVPRODID.   |
| ISVSVNLE           | 210            | 02           | N     | Launch Enclave's ISVSVN.  |
| RESERVED           | 212            | 24           | N     | Reserved.   |
| MASKEDMISCSELECTLE | 236            | 4            |       | Launch Enclave's MASKEDMISCSELECT: set by the LE to the resolved MISCSELECT value, used by EGETKEY (after applying KEYREQUEST's masking). |
| MASKEDATTRIBUTESLE | 240            | 16           | N     | Launch Enclave's MASKEDATTRIBUTES: This should be set to the LE's ATTRIBUTES masked with ATTRIBUTEMASK of the LE's KEYREQUEST.            |
| KEYID              | 256            | 32           | N     | Value for key wear-out protection.  |
| MAC                | 288            | 16           | N     | Message Authentication Code on EINITTOKEN using EINITTOKEN_KEY.   |

## 37.15 REPORT (REPORT)

The REPORT structure is the output of the EREPORT instruction, and must be 512-Byte aligned.

**Table 37-21. Layout of REPORT**

| Field         | OFFSET (Bytes) | Size (Bytes) | Description   |
|---------------|----------------|--------------|---|
| CPUSVN        | 0              | 16           | The security version number of the processor.   |
| MISCSELECT    | 16             | 4            | Bit vector specifying which extended features are saved to the MISC region of the SSA frame when an AEX occurs. |
| RESERVED      | 20             | 12           | Zero.   |
| ISVEXTNPRODID | 32             | 16           | The value of SECS.ISVEXTPRODID.   |
| ATTRIBUTES    | 48             | 16           | ATTRIBUTES of the Enclave. See Section 37.7.1.  |
| MRENCLAVE     | 64             | 32           | The value of SECS.MRENCLAVE.  |
| RESERVED      | 96             | 32           | Zero.   |
| MRSIGNER      | 128            | 32           | The value of SECS.MRSIGNER.   |
| RESERVED      | 160            | 32           | Zero.   |
| CONFIGID      | 192            | 64           | Value provided by SW to identify enclave's post EINIT configuration.  |
| ISVPRODID     | 256            | 02           | Product ID of enclave.  |
| ISVSVN        | 258            | 02           | Security version number (SVN) of the enclave.   |
| CONFIGSVN     | 260            | 02           | Value provided by SW to indicate expected SVN of enclave's post EINIT configuration.                            |
| RESERVED      | 262            | 42           | Zero.   |
| ISVFAMILYID   | 304            | 16           | The value of SECS.ISVFAMILYID.  |

**Table 37-21. Layout of REPORT**

| Field      | OFFSET (Bytes) | Size (Bytes) | Description   |
|------------|----------------|--------------|---|
| REPORTDATA | 320            | 64           | Data provided by the user and protected by the REPORT's MAC, see Section 37.15.1. |
| KEYID      | 384            | 32           | Value for key wear-out protection.  |
| MAC        | 416            | 16           | Message Authentication Code on the report using report key.                       |

### 37.15.1 REPORTDATA

REPORTDATA is a 64-Byte data structure that is provided by the enclave and included in the REPORT. It can be used to securely pass information from the enclave to the target enclave.

## 37.16 REPORT TARGET INFO (TARGETINFO)

This structure is an input parameter to the EREPORT leaf function. The address of TARGETINFO is specified as an effective address in RBX. It is used to identify the target enclave which will be able to cryptographically verify the REPORT structure returned by EREPORT. TARGETINFO must be 512-Byte aligned.

**Table 37-22. Layout of TARGETINFO Data Structure**

| Field       | OFFSET (Bytes) | Size (Bytes) | Description                                 |
|-------------|----------------|--------------|---|
| MEASUREMENT | 0              | 32           | The MRENCLAVE of the target enclave.        |
| ATTRIBUTES  | 32             | 16           | The ATTRIBUTES field of the target enclave. |
| RESERVED    | 48             | 2            | Must be zero.                               |
| CONFIGSVN   | 50             | 2            | CONFIGSVN of the target enclave.            |
| MISCSELECT  | 52             | 4            | The MISCSELECT of the target enclave.       |
| RESERVED    | 56             | 8            | Must be zero.                               |
| CONFIGID    | 64             | 64           | CONFIGID of target enclave.                 |
| RESERVED    | 128            | 384          | Must be zero.                               |

## 37.17 KEY REQUEST (KEYREQUEST)

This structure is an input parameter to the EGETKEY leaf function. It is passed in as an effective address in RBX and must be 512-Byte aligned. It is used for selecting the appropriate key and any additional parameters required in the derivation of that key.

**Table 37-23. Layout of KEYREQUEST Data Structure**

| Field         | OFFSET (Bytes) | Size (Bytes) | Description   |
|---------------|----------------|--------------|---|
| KEYNAME       | 0              | 02           | Identifies the Key Required.  |
| KEYPOLICY     | 02             | 02           | Identifies which inputs are required to be used in the key derivation.    |
| ISVSVN        | 04             | 02           | The ISV security version number that will be used in the key derivation.  |
| RESERVED      | 06             | 02           | Must be zero.   |
| CPUSVN        | 08             | 16           | The security version number of the processor used in the key derivation.  |
| ATTRIBUTEMASK | 24             | 16           | A mask defining which ATTRIBUTES bits will be included in key derivation. |
| KEYID         | 40             | 32           | Value for key wear-out protection.  |
| MISCMASK      | 72             | 04           | A mask defining which MISCSELECT bits will be included in key derivation. |

**Table 37-23. Layout of KEYREQUEST Data Structure**

| Field     | OFFSET (Bytes) | Size (Bytes) | Description   |
|-----------|----------------|--------------|---|
| CONFIGSVN | 76             | 02           | Identifies which enclave Configuration's Security Version should be used in key derivation. |
| RESERVED  | 78             | 434          |   |

### 37.17.1 KEY REQUEST KeyNames

**Table 37-24. Supported KEYName Values**

| Key Name           | Value     | Description           |
|--------------------|-----------|-----------------------|
| EINITTOKEN_KEY     | 0         | EINIT_TOKEN key       |
| PROVISION_KEY      | 1         | Provisioning Key      |
| PROVISION_SEAL_KEY | 2         | Provisioning Seal Key |
| REPORT_KEY         | 3         | Report Key            |
| SEAL_KEY           | 4         | Seal Key              |
|                    | All other | Reserved              |

### 37.17.2 Key Request Policy Structure

**Table 37-25. Layout of KEYPOLICY Field**

| Field        | Bit Position | Description  |
|--------------|--------------|--|
| MRENCLAVE    | 0            | If 1, derive key using the enclave's MRENCLAVE measurement register. |
| MRSIGNER     | 1            | If 1, derive key using the enclave's MRSIGNER measurement register.  |
| NOISVPRODID  | 2            | If 1, derive key WITHOUT using the enclave's ISVPRODID value.        |
| CONFIGID     | 3            | If 1, derive key using the enclave's CONFIGID value.                 |
| ISVFAMILYID  | 4            | If 1, derive key using the enclave ISVFAMILYID value.                |
| ISVEXTPRODID | 5            | If 1, derive key using enclave's ISVEXTPRODID value.                 |
| RESERVED     | 15:6         | Must be zero.  |

## 37.18 VERSION ARRAY (VA)

In order to securely store the versions of evicted EPC pages, Intel SGX defines a special EPC page type called a Version Array (VA). Each VA page contains 512 slots, each of which can contain an 8-byte version number for a page evicted from the EPC. When an EPC page is evicted, software chooses an empty slot in a VA page; this slot receives the unique version number of the page being evicted. When the EPC page is reloaded, there must be a VA slot that must hold the version of the page. If the page is successfully reloaded, the version in the VA slot is cleared.

VA pages can be evicted, just like any other EPC page. When evicting a VA page, a version slot in some other VA page must be used to hold the version for the VA being evicted. A Version Array Page must be 4K-Bytes aligned.

**Table 37-26. Layout of Version Array Data Structure**

| Field    | OFFSET (Bytes) | Size (Bytes) | Description      |
|----------|----------------|--------------|------------------|
| Slot 0   | 0              | 08           | Version Slot 0   |
| Slot 1   | 8              | 08           | Version Slot 1   |
| ...      |                |              |                  |
| Slot 511 | 4088           | 08           | Version Slot 511 |

## 37.19 ENCLAVE PAGE CACHE MAP (EPCM)

EPCM is a secure structure used by the processor to track the contents of the EPC. The EPCM holds exactly one entry for each page that is currently loaded into the EPC. EPCM is not accessible by software, and the layout of EPCM fields is implementation specific.

**Table 37-27. Content of an Enclave Page Cache Map Entry**

| Field          | Description  |
|----------------|--|
| VALID          | Indicates whether the EPCM entry is valid.   |
| R              | Read access; indicates whether enclave accesses for reads are allowed from the EPC page referenced by this entry.                  |
| W              | Write access; indicates whether enclave accesses for writes are allowed to the EPC page referenced by this entry.                  |
| X              | Execute access; indicates whether enclave accesses for instruction fetches are allowed from the EPC page referenced by this entry. |
| PT             | EPCM page type (PT_SECS, PT_TCS, PT_REG, PT_VA, PT_TRIM).  |
| ENCLAVESECS    | SECS identifier of the enclave to which the EPC page belongs.  |
| ENCLAVEADDRESS | Linear enclave address of the EPC page.  |
| BLOCKED        | Indicates whether the EPC page is in the blocked state.  |
| PENDING        | Indicates whether the EPC page is in the pending state.  |
| MODIFIED       | Indicates whether the EPC page is in the modified state.   |
| PR             | Indicates whether the EPC page is in a permission restriction state.   |

## 37.20 READ INFO (RDINFO)

The RDINFO structure contains status information about an EPC page. It must be aligned to 32-Bytes.

**Table 37-28. Layout of RDINFO Structure**

| Field          | OFFSET (Bytes) | Size (Bytes) | Description  |
|----------------|----------------|--------------|--|
| STATUS         | 0              | 8            | Page status information.                               |
| FLAGS          | 8              | 8            | EPCM state of the page.                                |
| ENCLAVECONTEXT | 16             | 8            | Context pointer describing the page's parent location. |

### 37.20.1 RDINFO Status Structure

**Table 37-29. Layout of RDINFO STATUS Structure**

| Field           | Bit Position | Description  |
|-----------------|--------------|--|
| CHILDPRESENT    | 0            | Indicates that the page has one or more child pages present (always zero for non-SECS pages). In VMX non-root operation includes the presence of virtual children. |
| VIRTCHLDPRESENT | 1            | Indicates that the page has one or more virtual child pages present (always zero for non-SECS pages). In VMX non-root operation this value is always zero.         |
| RESERVED        | 63:2         |  |

### 37.20.2 RDINFO Flags Structure

**Table 37-30. Layout of RDINFO FLAGS Structure**

| Field     | Bit Position | Description  |
|-----------|--------------|--|
| R         | 0            | Read access; indicates whether enclave accesses for reads are allowed from the EPC page referenced by this entry.                  |
| W         | 1            | Write access; indicates whether enclave accesses for writes are allowed to the EPC page referenced by this entry.                  |
| X         | 2            | Execute access; indicates whether enclave accesses for instruction fetches are allowed from the EPC page referenced by this entry. |
| PENDING   | 3            | Indicates whether the EPC page is in the pending state.  |
| MODIFIED  | 4            | Indicates whether the EPC page is in the modified state.   |
| PR        | 5            | Indicates whether the EPC page is in a permission restriction state.   |
| RESERVED  | 7:6          |  |
| PAGE_TYPE | 15:8         | Indicates the page type of the EPC page.   |
| RESERVED  | 62:16        |  |
| BLOCKED   | 63           | Indicates whether the EPC page is in the blocked state.  |

## 25. Updates to Chapter 38, Volume 3D

Change bars show changes to Chapter 38 of the *Intel® 64 and IA-32 Architectures Software Developer's Manual, Volume 3D: System Programming Guide, Part 4*.

-----  
Changes to this chapter: Various updates throughout chapter regarding Intel SGX and new Intel SGX VM Over-subscription feature.

## CHAPTER 38

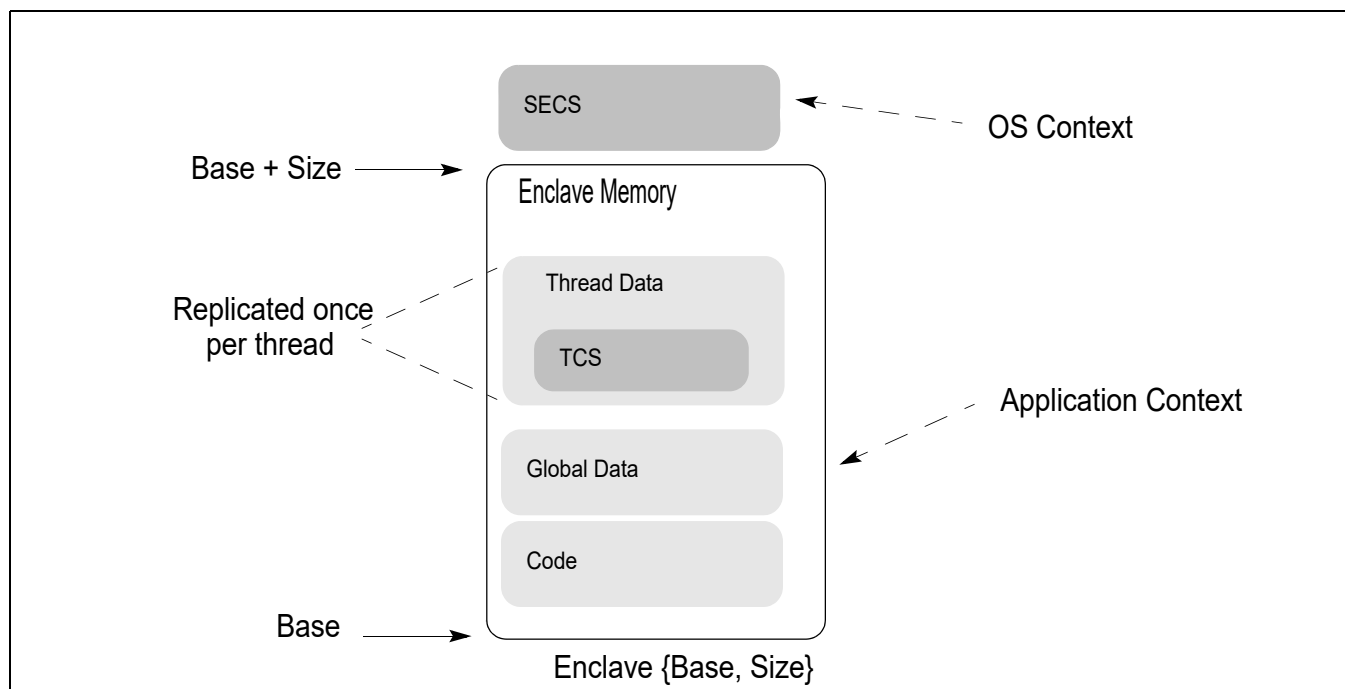

# ENCLAVE OPERATION

The following aspects of enclave operation are described in this chapter:

- Enclave creation: Includes loading code and data from outside of enclave into the EPC and establishing the enclave entity.
- Adding pages and measuring the enclave.
- Initialization of an enclave: Finalizes the cryptographic log and establishes the enclave identity and sealing identity.
- Enclave entry and exiting including:
  - Controlled entry and exit.
  - Asynchronous Enclave Exit (AEX) and resuming execution after an AEX.

### 38.1 CONSTRUCTING AN ENCLAVE

Figure 38-1 illustrates a typical Enclave memory layout.

**Figure 38-1. Enclave Memory Layout**

The enclave creation, commitment of memory resources, and finalizing the enclave's identity with measurement comprises multiple phases. This process can be illustrated by the following exemplary steps:

1. The application hands over the enclave content along with additional information required by the enclave creation API to the enclave creation service running at privilege level 0.
2. The enclave creation service running at privilege level 0 uses the ECREATE leaf function to set up the initial environment, specifying base address and size of the enclave. This address range, the ELRANGE, is part of the application's address space. This reserves the memory range. The enclave will now reside in this address

region. ECREATE also allocates an Enclave Page Cache (EPC) page for the SGX Enclave Control Structure (SECS). Note that this page is not required to be a part of the enclave linear address space and is not required to be mapped into the process.

3. The enclave creation service uses the EADD leaf function to commit EPC pages to the enclave, and use EEXTEND to measure the committed memory content of the enclave. For each page to be added to the enclave:
  - Use EADD to add the new page to the enclave.
  - If the enclave developer requires measurement of the page as a proof for the content, use EEXTEND to add a measurement for 256 bytes of the page. Repeat this operation until the entire page is measured.
4. The enclave creation service uses the EINIT leaf function to complete the enclave creation process and finalize the enclave measurement to establish the enclave identity. Until an EINIT is executed, the enclave is not permitted to execute any enclave code (i.e. entering the enclave by executing EENTER would result in a fault).

### 38.1.1 ECREATE

The ECREATE leaf function sets up the initial environment for the enclave by reading an SGX Enclave Control Structure (SECS) that contains the enclave's address range (ELRANGE) as defined by BASEADDR and SIZE, the ATTRIBUTES and MISCSELECT bitmaps, and the SSAFRAMESIZE. It then securely stores this information in an Enclave Page Cache (EPC) page. ELRANGE is part of the application's address space. ECREATE also initializes a cryptographic log of the enclave's build process.

### 38.1.2 EADD and EEXTEND Interaction

Once the SECS has been created, enclave pages can be added to the enclave via EADD. This involves converting a free EPC page into either a PT\_REG or a PT\_TCS page.

When EADD is invoked, the processor will update the EPCM entry with the type of page (PT\_REG or PT\_TCS), the linear address used by the enclave to access the page, and the enclave access permissions for the page. It associates the page to the SECS provided as input. The EPCM entry information is used by hardware to manage access control to the page. EADD records EPCM information in the cryptographic log stored in the SECS and copies 4 KBytes of data from unprotected memory outside the EPC to the allocated EPC page.

System software is responsible for selecting a free EPC page. System software is also responsible for providing the type of page to be added, the attributes of the page, the contents of the page, and the SECS (enclave) to which the page is to be added as requested by the application. Incorrect data would lead to a failure of EADD or to an incorrect cryptographic log and a failure at EINIT time.

After a page has been added to an enclave, software can measure a 256 byte region as determined by the developer by invoking EEXTEND. Thus to measure an entire 4KB page, system software must execute EEXTEND 16 times. Each invocation of EEXTEND adds to the cryptographic log information about which region is being measured and the measurement of the section.

Entries in the cryptographic log define the measurement of the enclave and are critical in gaining assurance that the enclave was correctly constructed by the untrusted system software.

### 38.1.3 EINIT Interaction

Once system software has completed the process of adding and measuring pages, the enclave needs to be initialized by the EINIT leaf function. After an enclave is initialized, EADD and EEXTEND are disabled for that enclave (An attempt to execute EADD/EEXTEND to enclave after enclave initialization will result in a fault). The initialization process finalizes the cryptographic log and establishes the **enclave identity** and **sealing identity** used by EGETKEY and EREPORT.

A cryptographic hash of the log is stored as the **enclave identity**. Correct construction of the enclave results in the cryptographic hash matching the one built by the enclave owner and included as the ENCLAVEHASH field of SIGSTRUCT. The **enclave identity** provided by the EREPORT leaf function can be verified by a remote party.

The EINIT leaf function checks the EINIT token to validate that the enclave has been enabled on this platform. If the enclave is not correctly constructed, or the EINIT token is not valid for the platform, or SIGSTRUCT isn't properly signed, then EINIT will fail. See the EINIT leaf function for details on the error reporting.

The **enclave identity** is a cryptographic hash that reflects the enclave attributes and MISCSELECT value, content of the enclave, the order in which it was built, the addresses it occupies in memory, the security attributes, and access right permissions of each page. The **enclave identity** is established by the EINIT leaf function.

The **sealing identity** is managed by a sealing authority represented by the hash of the public key used to sign the SIGSTRUCT structure processed by EINIT. The sealing authority assigns a product ID (ISVPRODID) and security version number (ISVSVN) to a particular enclave identity.

EINIT establishes the sealing identity using the following steps:

1. Verifies that SIGSTRUCT is properly signed using the public key enclosed in the SIGSTRUCT.
2. Checks that the measurement of the enclave matches the measurement of the enclave specified in SIGSTRUCT.
3. Checks that the enclave's attributes and MISCSELECT values are compatible with those specified in SIGSTRUCT.
4. Finalizes the measurement of the enclave and records the **sealing identity** (the sealing authority, product id and security version number) and **enclave identity** in the SECS.
5. Sets the ATTRIBUTES.INIT bit for the enclave.

### 38.1.4 Intel® SGX Launch Control Configuration

Intel® SGX Launch Control is a set of controls that govern the creation of enclaves. Before the EINIT leaf function will successfully initialize an enclave, a designated Launch Enclave must create an EINITTOKEN for that enclave. Launch Enclaves have SECS.ATTRIBUTES.EINITTOKEN\_KEY = 1, granting them access to the EINITTOKEN\_KEY from the EGETKEY leaf function. EINITTOKEN\_KEY must be used by the Launch Enclave when computing EINIT-TOKEN.MAC, the Message Authentication Code of the EINITTOKEN.

The hash of the public key used to sign the SIGSTRUCT of the Launch Enclave must equal the value in the IA32\_SGXLEPUBKEYHASH MSRs. Only Launch Enclaves are allowed to launch without a valid token.

The IA32\_SGXLEPUBKEYHASH MSRs are provided to designate the platform's Launch Enclave. IA32\_SGXLEPUBKEYHASH defaults to digest of Intel's launch enclave signing key after reset.

IA32\_FEATURE\_CONTROL bit 17 controls the permissions on the IA32\_SGXLEPUBKEYHASH MSRs when CPUID.(EAX=12H, ECX=00H):EAX[0] = 1. If IA32\_FEATURE\_CONTROL is locked with bit 17 set, IA32\_SGXLEPUBKEYHASH MSRs are reconfigurable (writeable). If either IA32\_FEATURE\_CONTROL is not locked or bit 17 is clear, the MSRs are read only. By leaving these MSRs writable, system SW or a VMM can support a plurality of Launch Enclaves for hosting multiple execution environments. See Table 42.2.2 for more details.

## 38.2 ENCLAVE ENTRY AND EXITING

### 38.2.1 Controlled Entry and Exit

The EENTER leaf function is the method to enter the enclave under program control. To execute EENTER, software must supply an address of a TCS that is part of the enclave to be entered. The TCS holds the location inside the enclave to transfer control to and a pointer to the SSA frame inside the enclave that an AEX should store the register state to.

When a logical processor enters an enclave, the TCS is considered busy until the logical processors exits the enclave. An attempt to enter an enclave through a busy TCS results in a fault. Intel® SGX allows an enclave builder to define multiple TCSs, thereby providing support for multithreaded enclaves.

Software must also supply to EENTER the Asynchronous Exit Pointer (AEP) parameter. AEP is an address external to the enclave which an exception handler will return to using IRET. Typically the location would contain the ERESUME instruction. ERESUME transfers control back to the enclave, to the address retrieved from the enclave thread's saved state.

EENTER performs the following operations:

1. Check that TCS is not busy and flush all cached linear-to-physical mappings.
2. Change the mode of operation to be in enclave mode.
3. Save the old RSP, RBP for later restore on AEX (Software is responsible for setting up the new RSP, RBP to be used inside enclave).
4. Save XCR0 and replace it with the XFRM value for the enclave.
5. Check if software wishes to debug (applicable to a debuggable enclave):
  - If not debugging, then configure hardware so the enclave appears as a single instruction.
  - If debugging, then configure hardware to allow traps, breakpoints, and single steps inside the enclave.
6. Set the TCS as busy.
7. Transfer control from outside enclave to predetermined location inside the enclave specified by the TCS.

The EEXIT leaf function is the method of leaving the enclave under program control. EEXIT receives the target address outside of the enclave that the enclave wishes to transfer control to. It is the responsibility of enclave software to erase any secret from the registers prior to invoking EEXIT. To allow enclave software to easily perform an external function call and re-enter the enclave (using EEXIT and EENTER leaf functions), EEXIT returns the value of the AEP that was used when the enclave was entered.

EEXIT performs the following operations:

1. Clear enclave mode and flush all cached linear-to-physical mappings.
2. Mark TCS as not busy.
3. Transfer control from inside the enclave to a location on the outside specified as parameter to the EEXIT leaf function.

### 38.2.2 Asynchronous Enclave Exit (AEX)

Asynchronous and synchronous events, such as exceptions, interrupts, traps, SMIs, and VM exits may occur while executing inside an enclave. These events are referred to as Enclave Exiting Events (EEE). Upon an EEE, the processor state is securely saved inside the enclave (in the thread's current SSA frame) and then replaced by a synthetic state to prevent leakage of secrets. The process of securely saving state and establishing the synthetic state is called an Asynchronous Enclave Exit (AEX). Details of AEX is described in Chapter 39, "Enclave Exiting Events".

As part of most EEEs, the AEP is pushed onto the stack as the location of the eventing address. This is the location where control will return to after executing the IRET. The ERESUME leaf function can be executed from that point to reenter the enclave and resume execution from the interrupted point.

After AEX has completed, the logical processor is no longer in enclave mode and the exiting event is processed normally. Any new events that occur after the AEX has completed are treated as having occurred outside the enclave (e.g. a #PF in dispatching to an interrupt handler).

### 38.2.3 Resuming Execution after AEX

After system software has serviced the event that caused the logical processor to exit an enclave, the logical processor can continue enclave execution using ERESUME. ERESUME restores processor state and returns control to where execution was interrupted.

If the cause of the exit was an exception or a fault and was not resolved, the event will be triggered again if the enclave is re-entered using ERESUME. For example, if an enclave performs a divide by 0 operation, executing ERESUME will cause the enclave to attempt to re-execute the faulting instruction and result in another divide by 0 exception. Intel® SGX provides the means for an enclave developer to handle enclave exceptions from within the enclave. Software can enter the enclave at a different location and invoke the exception handler within the enclave by executing the EENTER leaf function. The exception handler within the enclave can read the fault information from the SSA frame and attempt to resolve the faulting condition or simply return and indicate to software that the enclave should be terminated (e.g. using EEXIT).

### 38.2.3.1 ERESUME Interaction

ERESUME restores registers depending on the mode of the enclave (32 or 64 bit).

- In 32-bit mode (IA32\_EFER.LMA = 0 || CS.L = 0), the low 32-bits of the legacy registers (EAX, EBX, ECX, EDX, ESP, EBP, ESI, EDI, EIP and EFLAGS) are restored from the thread's GPR area of the current SSA frame. Neither the upper 32 bits of the legacy registers nor the 64-bit registers (R8 ... R15) are loaded.
- In 64-bit mode (IA32\_EFER.LMA = 1 && CS.L = 1), all 64 bits of the general processor registers (RAX, RBX, RCX, RDX, RSP, RBP, RSI, RDI, R8 ... R15, RIP and RFLAGS) are loaded.

Extended features specified by SECS.ATTRIBUTES.XFRM are restored from the XSAVE area of the current SSA frame. The layout of the x87 area depends on the current values of IA32\_EFER.LMA and CS.L:

- IA32\_EFER.LMA = 0 || CS.L = 0
  - 32-bit load in the same format that XSAVE/FXSAVE uses with these values.
- IA32\_EFER.LMA = 1 && CS.L = 1
  - 64-bit load in the same format that XSAVE/FXSAVE uses with these values as if REX.W = 1.

## 38.3 CALLING ENCLAVE PROCEDURES

### 38.3.1 Calling Convention

In standard call conventions subroutine parameters are generally pushed onto the stack. The called routine, being aware of its own stack layout, knows how to find parameters based on compile-time-computable offsets from the SP or BP register (depending on runtime conventions used by the compiler).

Because of the stack switch when calling an enclave, stack-located parameters cannot be found in this manner. Entering the enclave requires a modified parameter passing convention.

For example, the caller might push parameters onto the untrusted stack and then pass a pointer to those parameters in RAX to the enclave software. The exact choice of calling conventions is up to the writer of the edge routines; be those routines hand-coded or compiler generated.

### 38.3.2 Register Preservation

As with most systems, it is the responsibility of the callee to preserve all registers except that used for returning a value. This is consistent with conventional usage and tends to optimize the number of register save/restore operations that need be performed. It has the additional security result that it ensures that data is scrubbed from any registers that were used by enclave to temporarily contain secrets.

### 38.3.3 Returning to Caller

No registers are modified during EEXIT. It is the responsibility of software to remove secrets in registers before executing EEXIT.

## 38.4 INTEL® SGX KEY AND ATTESTATION

### 38.4.1 Enclave Measurement and Identification

During the enclave build process, two “measurements” are taken of each enclave and are stored in two 256-bit Measurement Registers (MR): MRENCLAVE and MRSIGNER. MRENCLAVE represents the enclave's contents and build process. MRSIGNER represents the entity that signed the enclave's SIGSTRUCT.

The values of the Measurement Registers are included in attestations to identify the enclave to remote parties. The MRs are also included in most keys, binding keys to enclaves with specific MRs.

### 38.4.1.1 MRENCLAVE

MRENCLAVE is a unique 256 bit value that identifies the code and data that was loaded into the enclave during the initial launch. It is computed as a SHA256 hash that is initialized by the ECREATE leaf function. EADD and EEXTEND leaf functions record information about each page and the content of those pages. The EINIT leaf function finalizes the hash, which is stored in SECS.MRENCLAVE. Any tampering with the build process, contents of a page, page permissions, etc will result in a different MRENCLAVE value.

Figure 38-2 illustrates a simplified flow of changes to the MRENCLAVE register when building an enclave:

- Enclave creation with ECREATE.
- Copying a non-enclave source page into the EPC of an un-initialized enclave with EADD.
- Updating twice of the MRENCLAVE after modifying the enclave’s page content, i.e. EEXTEND twice.
- Finalizing the enclave build with EINIT.

Details on specific values inserted in the hash are available in the individual instruction definitions.

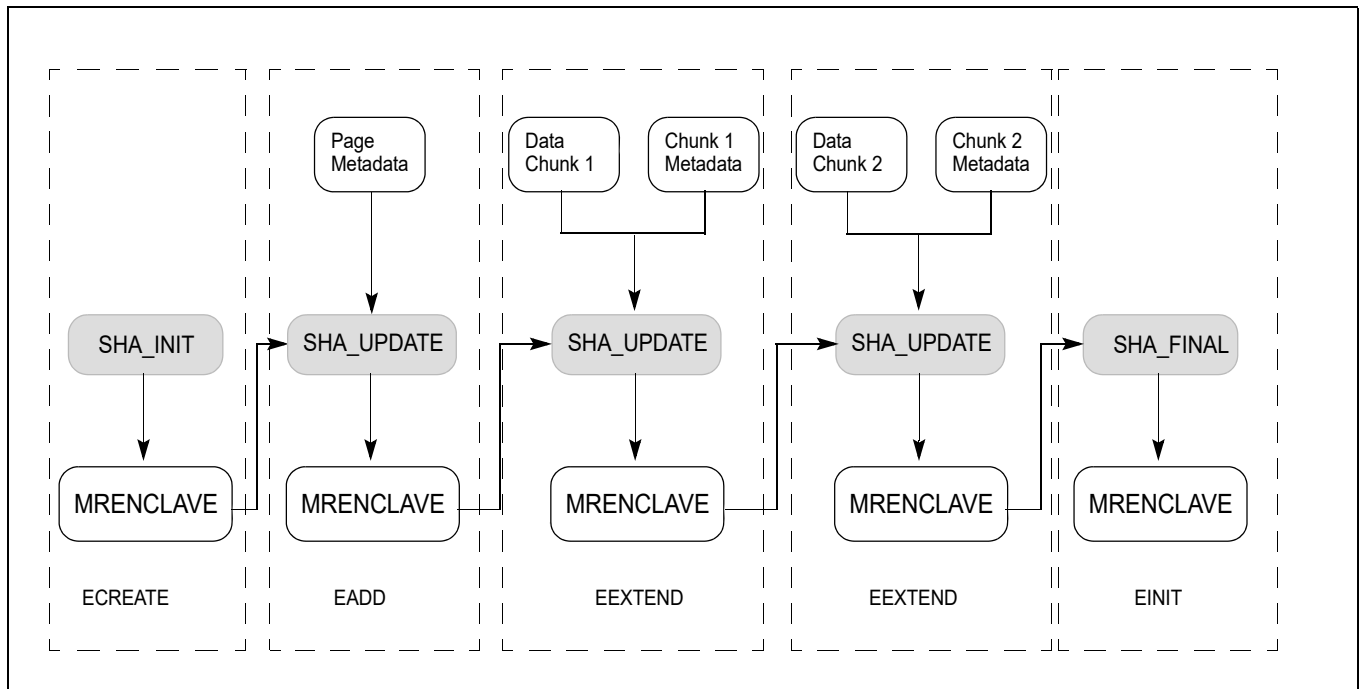

Figure 38-2. Measurement Flow of Enclave Build Process

### 38.4.1.2 MRSIGNER

Each enclave is signed using a 3072 bit RSA key. The signature is stored in the SIGSTRUCT. In the SIGSTRUCT, the enclave's signer also assigns a product ID (ISVPRODID) and a security version (ISVSVN) to the enclave.

MRSIGNER is the SHA-256 hash of the signer's public key. For platforms that support Key Separation and Sharing (CPUID.(EAX=12H, ECX=1).EAX.KSS[7]) the SIGSTRUCT can additionally specify an 16 byte extended product ID (ISVEXTPRODID), and a 16 byte family ID (ISVFAMILYID).

In attestation, MRSIGNER can be used to allow software to approve of an enclave based on the author rather than maintaining a list of MRENCLAVES. It is used in key derivation to allow software to create a lineage of an application. By signing multiple enclaves with the same key, the enclaves will share the same keys and data. Combined

with security version numbering, the author can release multiple versions of an application which can access keys for previous versions, but not future versions of that application.

### 38.4.1.3 CONFIGID

For platforms that support enhancements for key separation and sharing (CPUID.(EAX=12H, ECX=1).EAX.KSS[7]) when the enclave is created the platform can additionally provide 32-byte configuration identifier (CONFIGID). How this value is used is dependent on the enclave but it is intended to allow enclave creators to indicate what additional content may be accepted by the enclave post-initialization.

## 38.4.2 Security Version Numbers (SVN)

Intel® SGX supports a versioning system that allows the signer to identify different versions of the same software released by an author. The security version is independent of the functional version an author uses and is intended to specify security equivalence. Multiple releases with functional enhancements may all share the same SVN if they all have the same security properties or posture. Each enclave has an SVN and the underlying hardware has an SVN.

The SVNs are attested to in EREPORT and are included in the derivation of most keys, thus providing separation between data for older/newer versions.

### 38.4.2.1 Enclave Security Version

In the SIGSTRUCT, the MRSIGNER is associated with a 16-bit Product ID (ISVPRODID) and a 16 bit integer SVN (ISVSVN). Together they define a specific group of versions of a specific product. Most keys, including the Seal Key, can be bound to this pair.

To support upgrading from one release to another, EGETKEY will return keys corresponding to any value less than or equal to the software's ISVSVN.

### 38.4.2.2 Hardware Security Version

CPUSVN is a 128 bit value that reflects the microcode update version and authenticated code modules supported by the processor. Unlike ISVSVN, CPUSVN is not an integer and cannot be compared mathematically. Not all values are valid CPUSVNs.

Software must ensure that the CPUSVN provided to EGETKEY is valid. EREPORT will return the CPUSVN of the current environment. Software can execute EREPORT with TARGETINFO set to zeros to retrieve a CPUSVN from REPORTDATA. Software can access keys for a CPUSVN recorded previously, provided that each of the elements reflected in CPUSVN are the same or have been upgraded.

### 38.4.2.3 CONFIGID Security Version

The CONFIGID field can be used to contain the hash of a signing key for verifying the additional content. In this case, similar to the relationship between MRSIGNER and ISVSVN, CONFIGID needs a CONFIGID Security Version Number. CONFIGIDSVN can be specified at the same time as CONFIGID.

## 38.4.3 Keys

Intel® SGX provides software with access to keys unique to each processor and rooted in HW keys inserted into the processor during manufacturing.

Each enclave requests keys using the EGETKEY leaf function. The key is based on enclave parameters such as measurement, the enclave signing key, security attributes of the enclave, and the Hardware Security version of the processor itself. A full list of parameter options is specified in the KEYREQUEST structure, see details in Section 37.17.

By deriving keys using enclave properties, SGX guarantees that if two enclaves call EGETKEY, they will receive a unique key only accessible by the respective enclave. It also guarantees that the enclave will receive the same key

on every future execution of EGETKEY. Some parameters are optional or configurable by software. For example, a Seal key can be based on the signer of the enclave, resulting in a key available to multiple enclaves signed by the same party.

The EGETKEY leaf function provides several key types. Each key is specific to the processor, CPUSVN, and the enclave that executed EGETKEY. The EGETKEY instruction definition details how each of these keys is derived, see Table 40-64. Additionally,

- **SEAL Key:** The Seal key is a general purpose key for the enclave to use to protect secrets. Typical uses of the Seal key are encrypting and calculating MAC of secrets on disk. There are 2 types of Seal Key described in Section 38.4.3.1.
- **REPORT Key:** This key is used to compute the MAC on the REPORT structure. The EREPORT leaf function is used to compute this MAC, and destination enclave uses the Report key to verify the MAC. The software usage flow is detailed in Section 38.4.3.2.
- **EINITTOKEN\_KEY:** This key is used by Launch Enclaves to compute the MAC on EINITTOKENs. These tokens are then verified in the EINIT leaf function. The key is only available to enclaves with ATTRIBUTE.EINITTOKEN\_KEY set to 1.
- **PROVISIONING Key and PROVISIONING SEAL Key:** These keys are used by attestation key provisioning software to prove to remote parties that the processor is genuine and identify the currently executing TCB. These keys are only available to enclaves with ATTRIBUTE.PROVISIONKEY set to 1.

### 38.4.3.1 Sealing Enclave Data

Enclaves can protect persistent data using Seal keys to provide encryption and/or integrity protection. EGETKEY provides two types of Seal keys specified in KEYREQUEST.KEYPOLICY field: MRENCLAVE-based key and MRSIGNER-based key.

The MRENCLAVE-based keys are available only to enclave instances sharing the same MRENCLAVE. If a new version of the enclave is released, the Seal keys will be different. Retrieving previous data requires additional software support.

The MRSIGNER-based keys are bound to the 3 tuple (MRSIGNER, ISVPRODID, ISVSVN). These keys are available to any enclave with the same MRSIGNER and ISVPRODID and an ISVSVN equal to or greater than the key in question. This is valuable for allowing new versions of the same software to retrieve keys created before an upgrade.

For platforms that support enhancements for key separation and sharing (CPUID.(EAX=12H, ECX=1).EAX.KSS[7]) four additional key policies for seal key derivation are provided. These add the ISVEXTPRODID, ISVFAMILYID and CONFIGID/CONFIGSVN to the key derivation. Additionally there is a policy to remove ISVPRODID from a key derivation to create a shared between different products that share the same MRSIGNER.

### 38.4.3.2 Using REPORTs for Local Attestation

SGX provides a means for enclaves to securely identify one another, this is referred to as "Local Attestation". SGX provides a hardware assertion, REPORT that contains calling enclaves Attributes, Measurements and User supplied data (described in detail in Section 37.15). Figure 38-3 shows the basic flow of information.

1. The source enclave determines the identity of the target enclave to populate TARGETINFO.
2. The source enclave calls EREPORT instruction to generate a REPORT structure. The EREPORT instruction conducts the following:
  - Populates the REPORT with identify information about the calling enclave.
  - Derives the Report Key that is returned when the target enclave executes the EGETKEY. TARGETINFO provides information about the target.
  - Computes a MAC over the REPORT using derived target enclave Report Key.
3. Non-enclave software copies the REPORT from source to destination.
4. The target enclave executes the EGETKEY instruction to request its REPORT key, which is the same key used by EREPORT at the source.
5. The target enclave verifies the MAC and can then inspect the REPORT to identify the source.

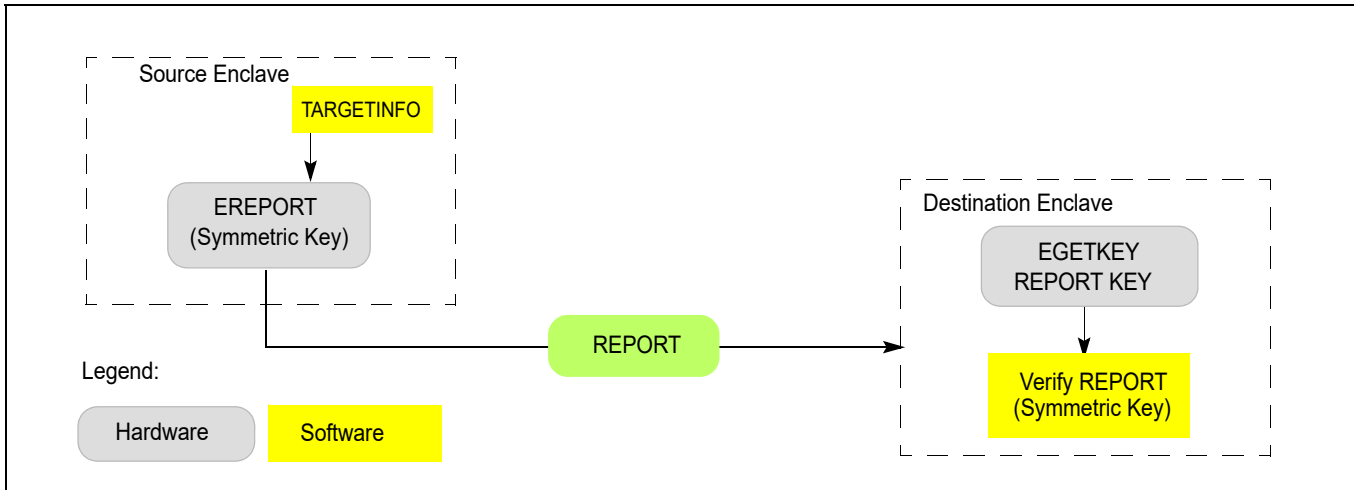

Figure 38-3. SGX Local Attestation

## 38.5 EPC AND MANAGEMENT OF EPC PAGES

EPC layout is implementation specific, and is enumerated through CPUID (see Table 36-7 for EPC layout). EPC is typically configured by BIOS at system boot time.

### 38.5.1 EPC Implementation

EPC must be properly protected against attacks. One example of EPC implementation could use a Memory Encryption Engine (MEE). An MEE provides a cost-effective mechanism of creating cryptographically protected volatile storage using platform DRAM. These units provide integrity, replay, and confidentiality protection. Details are implementation specific.

### 38.5.2 OS Management of EPC Pages

The EPC is a finite resource. SGX1 (i.e. CPUID.(EAX=12H, ECX=0):EAX.SGX1 = 1 but CPUID.(EAX=12H, ECX=0):EAX.SGX2 = 0) provides the EPC manager with leaf functions to manage this resource and properly swap pages out of and into the EPC. For that, the EPC manager would need to keep track of all EPC entries, type and state, context affiliation, and SECS affiliation.

Enclave pages that are candidates for eviction should be moved to BLOCKED state using EBLOCK instruction that ensures no new cached virtual to physical address mappings can be created by attempts to reference a BLOCKED page.

Before evicting blocked pages, EPC manager should execute ETRACK leaf function on that enclave and ensure that there are no stale cached virtual to physical address mappings for the blocked pages remain on any thread on the platform.

After removing all stale translations from blocked pages, system software should use the EWB leaf function for securely evicting pages out of the EPC. EWB encrypts a page in the EPC, writes it to unprotected memory, and invalidates the copy in EPC. In addition, EWB also creates a cryptographic MAC (PCMD.MAC) of the page and stores it in unprotected memory. A page can be reloaded back to the processor only if the data and MAC match. To ensure that only the latest version of the evicted page can be loaded back, the version of the evicted page is stored securely in a Version Array (VA) in EPC.

SGX1 includes two instructions for reloading pages that have been evicted by system software: ELDU and ELDB. The difference between the two instructions is the value of the paging state at the end of the instruction. ELDU results in a page being reloaded and set to an UNBLOCKED state, while ELDB results in a page loaded to a BLOCKED state.

ELDB is intended for use by a Virtual Machine Monitor (VMM). When a VMM reloads an evicted page, it needs to restore it to the correct state of the page (BLOCKED vs. UNBLOCKED) as it existed at the time the page was evicted. Based on the state of the page at eviction, the VMM chooses either ELDB or ELDU.

### 38.5.2.1 Enhancement to Managing EPC Pages

On processors supporting SGX2 (i.e. CPUID.(EAX=12H, ECX=0):EAX.SGX2 = 1), the EPC manager can manage EPC resources (while enclave is running) with more flexibility provided by the SGX2 leaf functions. The additional flexibility is described in Section 38.5.7 through Section 38.5.11.

## 38.5.3 Eviction of Enclave Pages

Intel SGX paging is optimized to allow the Operating System (OS) to evict multiple pages out of the EPC under a single synchronization.

The suggested flow for evicting a list of pages from the EPC is:

1. For each page to be evicted from the EPC:
  - a. Select an empty slot in a Version Array (VA) page.
    - If no empty VA page slots exist, create a new VA page using the EPA leaf function.
  - b. Remove linear-address to physical-address mapping from the enclave context's mapping tables (page table and EPT tables).
  - c. Execute the EBLOCK leaf function for the target page. This sets the target page state to BLOCKED. At this point no new mappings of the page will be created. So any access which does not have the mapping cached in the TLB will generate a #PF.
2. For each enclave containing pages selected in step 1:
  - Execute an ETRACK leaf function pointing to that enclave's SECS. This initiates the tracking process that ensures that all caching of linear-address to physical-address translations for the blocked pages is cleared.
3. For all logical processors executing in processes (OS) or guests (VMM) that contain the enclaves selected in step 1:
  - Issue an IPI (inter-processor interrupt) to those threads. This causes those logical processors to asynchronously exit any enclaves they might be in, and as a result flush cached linear-address to physical-address translations that might hold stale translations to blocked pages. There is no need for additional measures such as performing a "TLB shutdown".
4. After enclaves exit, allow logical processors to resume normal operation, including enclave re-entry as the tracking logic keeps track of the activity.
5. For each page to be evicted:
  - Evict the page using the EWB leaf function with parameters include the effective-address pointer to the EPC page, the VA slot, a 4K byte buffer to hold the encrypted page contents, and a 128 byte buffer to hold page metadata. The last three elements are tied together cryptographically and must be used to later reload the page.

At this point, system software has the only copy of each page data encrypted with its page metadata in main memory.

## 38.5.4 Loading an Enclave Page

To reload a previously evicted page, system software needs four elements: the VA slot used when the page was evicted, a buffer containing the encrypted page contents, a buffer containing the page metadata, and the parent SECS to associate this page with. If the VA page or the parent SECS are not already in the EPC, they must be reloaded first.

1. Execute ELDB/ELDU (depending on the desired BLOCKED state for the page), passing as parameters: the EPC page linear address, the VA slot, the encrypted page, and the page metadata.

2. Create a mapping in the enclave context's mapping tables (page tables and EPT tables) to allow the application to access that page (OS: system page table; VMM: EPT).

The ELDB/ELDU instruction marks the VA slot empty so that the page cannot be replayed at a later date.

### 38.5.5 Eviction of an SECS Page

The eviction of an SECS page is similar to the eviction of an enclave page. The only difference is that an SECS page cannot be evicted until all other pages belonging to the enclave have been evicted. Since all other pages have been evicted, there will be no threads executing inside the enclave and tracking with ETRACK isn't necessary. When reloading an enclave, the SECS page must be reloaded before all other constituent pages.

1. Ensure all pages are evicted from enclave.
2. Select an empty slot in a Version Array page.
  - If no VA page exists with an empty slot, create a new one using the EPA function leaf.
3. Evict the page using the EWB leaf function with parameters include the effective-address pointer to the EPC page, the VA slot, a 4K byte buffer to hold the encrypted page contents and a 128 byte buffer to hold page metadata. The last three elements are tied together cryptographically and must be used to later reload the page.

### 38.5.6 Eviction of a Version Array Page

VA pages do not belong to any enclave and tracking with ETRACK isn't necessary. When evicting the VA page, a slot in a different VA page must be specified in order to provide versioning of the evicted VA page.

1. Select a slot in a Version Array page other than the page being evicted.
  - If no VA page exists with an empty slot, create a new one using the EPA leaf function.
2. Evict the page using the EWB leaf function with parameters include the effective-address pointer to the EPC page, the VA slot, a 4K byte buffer to hold the encrypted page contents, and a 128 byte buffer to hold page metadata. The last three elements are tied together cryptographically and must be used to later reload the page.

### 38.5.7 Allocating a Regular Page

On processors that support SGX2, allocating a new page to an already initialized enclave is accomplished by invoking the EAUG leaf function. Typically, the enclave requests that the OS allocate a new page at a particular location within the enclave's address space. Once allocated, the page remains in a pending state until the enclave executes the corresponding EACCEPT leaf function to accept the new page into the enclave. Page allocation operations may be batched to improve efficiency.

The typical process for allocating a regular page is as follows:

1. Enclave requests additional memory from OS when the current allocation becomes insufficient.
2. The OS invokes the EAUG leaf function to add a new memory page to the enclave.
  - a. EAUG may only be called on a free EPC page.
  - b. Successful completion of the EAUG instruction places the target page in the VALID and PENDING state.
  - c. All dynamically created pages have the type PT\_REG and content of all zeros.
3. The OS maps the page in the enclave context's mapping tables.
4. The enclave issues an EACCEPT instruction, which verifies the page's attributes and clears the PENDING state. At that point the page becomes accessible for normal enclave use.

### 38.5.8 Allocating a TCS Page

On processors that support SGX2, allocating a new TCS page to an already initialized enclave is a two-step process. First the OS allocates a regular page with a call to EAUG. This page must then be accepted and initialized by the enclave to which it belongs. Once the page has been initialized with appropriate values for a TCS page, the enclave requests the OS to change the page's type to PT\_TCS. This change must also be accepted. As with allocating a regular page, TCS allocation operations may be batched.

A typical process for allocating a TCS page is as follows:

1. Enclave requests an additional page from the OS.
2. The OS invokes EAUG to add a new regular memory page to the enclave.
  - a. EAUG may only be called on a free EPC page.
  - b. Successful completion of the EAUG instruction places the target page in the VALID and PENDING state.
3. The OS maps the page in the enclave context's mapping tables.
4. The enclave issues an EACCEPT instruction, at which point the page becomes accessible for normal enclave use.
5. The enclave initializes the contents of the new page.
6. The enclave requests that the OS convert the page from type PT\_REG to PT\_TCS.
7. OS issues an EMODT instruction on the page.
  - a. The parameters to EMODT indicate that the regular page should be converted into a TCS.
  - b. EMODT forces all access rights to a page to be removed because TCS pages may not be accessed by enclave code.
8. The enclave issues an EACCEPT instruction to confirm the requested modification.

### 38.5.9 Trimming a Page

On processors that support SGX2, Intel SGX supports the trimming of an enclave page as a special case of EMODT. Trimming allows an enclave to actively participate in the process of removing a page from the enclave (deallocation) by splitting the process into first removing it from the enclave's access and then removing it from the EPC using the EREMOVE leaf function. The page type PT\_TRIM indicates that a page has been trimmed from the enclave's address space and that the page is no longer accessible to enclave software. Modifications to a page in the PT\_TRIM state are not permitted; the page must be removed and then reallocated by the OS before the enclave may use the page again. Page deallocation operations may be batched to improve efficiency.

The typical process for trimming a page from an enclave is as follows:

1. Enclave signals OS that a particular page is no longer in use.
2. OS invokes the EMODT leaf function on the page, requesting that the page's type be changed to PT\_TRIM.
  - a. SECS and VA pages cannot be trimmed in this way, so the initial type of the page must be PT\_REG or PT\_TCS.
  - b. EMODT may only be called on valid enclave pages.
3. OS invokes the ETRACK leaf function on the enclave containing the page to track removal the TLB addresses from all the processors.
4. Issue an IPI (inter-processor interrupt) to flush the stale linear-address to physical-address translations for all logical processors executing in processes that contain the enclave.
5. Enclave issues an EACCEPT leaf function.
6. The OS may now permanently remove the page from the EPC (by issuing EREMOVE).

### 38.5.10 Restricting the EPCM Permissions of a Page

On processors that support SGX2, restricting the EPCM permissions associated with an enclave page is accomplished using the EMODPR leaf function. This operation requires the cooperation of the OS to flush stale entries to

the page and to update the page-table permissions of the page to match. Permissions restriction operations may be batched.

The typical process for restricting the permissions of an enclave page is as follows:

1. Enclave requests that the OS to restrict the permissions of an EPC page.
2. OS performs permission restriction, flushing cached linear-address to physical-address translations, and page-table modifications.
  - a. Invokes the EMODPR leaf function to restrict permissions (EMODPR may only be called on VALID pages).
  - b. Invokes the ETRACK leaf function on the enclave containing the page to track removal of the TLB addresses from all the processor.
  - c. Issue an IPI (inter-processor interrupt) to flush the stale linear-address to physical-address translations for all logical processors executing in processes that contain the enclave.
  - d. Sends IPIs to trigger enclave thread exit and TLB shutdown.
  - e. OS informs the Enclave that all logical processors should now see the new restricted permissions.
3. Enclave invokes the EACCEPT leaf function.
  - a. Enclave may access the page throughout the entire process.
  - b. Successful call to EACCEPT guarantees that no stale cached linear-address to physical-address translations are present.

### 38.5.11 Extending the EPCM Permissions of a Page

On processors that support SGX2, extending the EPCM permissions associated with an enclave page is accomplished directly by the enclave using the EMODPE leaf function. After performing the EPCM permission extension, the enclave requests the OS to update the page table permissions to match the extended permission. Security wise, permission extension does not require enclave threads to leave the enclave as TLBs with stale references to the more restrictive permissions will be flushed on demand, but to allow forward progress, an OS needs to be aware that an application might signal a page fault.

The typical process for extending the permissions of an enclave page is as follows:

1. Enclave invokes EMODPE to extend the EPCM permissions associated with an EPC page (EMODPE may only be called on VALID pages).
2. Enclave requests that OS update the page tables to match the new EPCM permissions.
3. Enclave code resumes.
  - a. If cached linear-address to physical-address translations are present to the more restrictive permissions, the enclave thread will page fault. The SGX2-aware OS will see that the page tables permit the access and resume the thread, which can now successfully access the page because exiting cleared the TLB.
  - b. If cached linear-address to physical-address translations are not present, access to the page with the new permissions will succeed without an enclave exit.

### 38.5.12 VMM Oversubscription of EPC

On processors supporting oversubscription enhancements (.e. CPUID.(EAX=12H, ECX=0):EAX.[5]=1 & EAX[6] = 1) a Virtual Machine Monitor or other executive can more efficiently manage the EPC space available on the platform between virtualized entities. A typical process for using these instructions to support oversubscribing the physical EPC space on the platform is as follows:

1. VMM creates data structures for SECS tracking including a count of child pages.
2. VMM selects possible EPC victim pages.
3. VMM ages the victim pages. Some of the selected pages will be accessed by the guest. In this case the VMM will remove these pages from the victim pool and return them to the guest.
4. VMM makes remaining pages not present in EPT. It then issues IPI on each page to remove TLB mappings.

5. For every EPC victim page the VMM obtains the victim's SECS page info using ERDINFO.
  - a. ENCLAVECONTEXT field in RDINFO structure will indicate the location of SECS, and the PAGE\_TYPE field will indicate the page type.
  - b. Child pages of SECS can be evicted.
  - c. SECS pages may be evicted if the child count is zero.
  - d. Some pages may be returned to active state depending on such things as page type or child count.
6. VMM increments its evicted page count for the SECS of each page (stored in the data structure created in 1).
7. If this is the first evicted page of that SECS, set Marker on SECS of the victim page (EINCVIRTCHILD). This locks the SECS in the guest. The guest cannot page out the SECS.
8. EBLOCK, ETRACK, EWB eviction sequence is executed for page.
9. After loading an SECS page back in, the VMM will set the correct ENCLAVECONTEXT for the guest using ESETCONTEXT instruction.

## 38.6 CHANGES TO INSTRUCTION BEHAVIOR INSIDE AN ENCLAVE

This section covers instructions whose behavior changes when executed in enclave mode.

### 38.6.1 Illegal Instructions

The instructions listed in Table 38-1 are ring 3 instructions which become illegal when executed inside an enclave. Executing these instructions inside an enclave will generate an exception.

The first row of Table 38-1 enumerates instructions that may cause a VM exit for VMM emulation. Since a VMM cannot emulate enclave execution, execution of any these instructions inside an enclave results in an invalid-opcode exception (#UD) and no VM exit.

The second row of Table 38-1 enumerates I/O instructions that may cause a fault or a VM exit for emulation. Again, enclave execution cannot be emulated, so execution of any these instructions inside an enclave results in #UD.

The third row of Table 38-1 enumerates instructions that load descriptors from the GDT or the LDT or that change privilege level. The former class is disallowed because enclave software should not depend on the contents of the descriptor tables and the latter because enclave execution must be entirely with CPL = 3. Again, execution of any these instructions inside an enclave results in #UD.

The fourth row of Table 38-1 enumerates instructions that provide access to kernel information from user mode and can be used to aid kernel exploits from within enclave. Execution of any these instructions inside an enclave results in #UD.

**Table 38-1. Illegal Instructions Inside an Enclave**

| Instructions   | Result | Comment  |
|--|--------|--|
| CPUID, GETSEC, RDPMC, SGDT, SIDT, SLDT, STR, VMCALL, VMFUNC  | #UD    | Might cause VM exit.                                     |
| IN, INS/INSB/INSW/INSD, OUT, OUTS/OUTSB/OUTSW/OUTSD  | #UD    | I/O fault may not safely recover. May require emulation. |
| Far call, Far jump, Far Ret, INT n/INT0, IRET, LDS/LFS/LGS/LSS, MOV to DS/ES/SS/FS/GS, POP DS/ES/SS/FS/GS, SYSCALL, SYSENTER | #UD    | Access segment register could change privilege level.    |
| SMSW   | #UD    | Might provide access to kernel information.              |
| ENCLU[EENTER], ENCLU[ERESUME]  | #GP    | Cannot enter an enclave from within an enclave.          |

RDTSR and RDTSCP are legal inside an enclave for processors that support SGX2 (subject to the value of CR4.TSD). For processors which support SGX1 but not SGX2, RDTSR and RDTSCP will cause #UD.

RDTSR and RDTSCP instructions may cause a VM exit when inside an enclave.

Software developers must take into account that the RDTSC/RDTSCP results are not immune to influences by other software, e.g. the TSC can be manipulated by software outside the enclave.

### 38.6.2 RDRAND and RDSEED Instructions

These instructions may cause a VM exit if the “RDRAND exiting” VM-execution control is 1. Unlike other instructions that can cause VM exits, these instructions are legal inside an enclave. As noted in Section 6.5.5, any VM exit originating on an instruction boundary inside an enclave sets bit 27 of the exit-reason field of the VMCS. If a VMM receives a VM exit due to an attempt to execute either of these instructions determines (by that bit) that the execution was inside an enclave, it can do either of two things. It can clear the “RDRAND exiting” VM-execution control and execute VMRESUME; this will result in the enclave executing RDRAND or RDSEED again, and this time a VM exit will not occur. Alternatively, the VMM might choose to discontinue execution of this virtual machine.

#### NOTE

It is expected that VMMs that virtualize Intel SGX will not set “RDRAND exiting” to 1.

### 38.6.3 PAUSE Instruction

The PAUSE instruction may cause a VM exit from an enclave if the “PAUSE exiting” VM-execution control is 1. Unlike other instructions that can cause VM exits, the PAUSE instruction is legal inside an enclave. If a VMM receives a VM exit due to the 1-setting of “PAUSE exiting”, it can do either of two things. It can clear the “PAUSE exiting” VM-execution control and execute VMRESUME; this will result in the enclave executing PAUSE again, but this time a VM exit will not occur. Alternatively, the VMM might choose to discontinue execution of this virtual machine.
